NEWS IN DAME UPCHURCH'S POST-BAG.

THE MORTONS OF MORTON HALL.

BY THE AUTHOR OF "THE GREAT VAN BROEK PROPERTY."

CHAPTER I.—A SHIPWRECK.

SOME fifty years ago there stood on the outskirts of the little secluded village of Codford, in one of the western counties of England, a pretty villa known as Rose Cottage. It was so called from the profusion of monthly roses which adorned its exterior. Roses not only clothed the porch, and half-hid the windows, but clambered over the walls, and clustered around the chimneys, so that during the seasons of summer and

autumn the cottage was almost concealed from the view of the passing traveller.

Rose Cottage was at this period the abode of one Captain Talbot and his wife and family. There were two children—a daughter, Mary, then in her twentieth year, and a son, Henry, sixteen years of age. At the date at which my story opens, however, Mrs. Talbot and her daughter were, excepting the servants, the sole residents in the cottage, since Captain Talbot, who commanded an Indiaman, was absent at sea, and his son Henry was pursuing his studies at Eton.

Mrs. Talbot, who had for some months past felt

herself declining in health, was becoming anxious for the return of her absent husband, who had been during the past two years sailing from port to port in the East Indian and Chinese seas. The captain had in his last letter hinted at the probability of his speedy return, and his wife hoped that the next letter she received from him would announce that he was at length about to sail for England.

Day after day for a month Mrs. Talbot and her daughter had anxiously watched for the return from the neighbouring post and market town of old Dame Upchurch, who for a term of thirty years had occupied the responsible position of post-woman and common carrier between the village and the post town in question. Day after day they had seen the sturdy old dame pass by, tugging at the halter of her donkey, and apparently exerting more strength to drag the cart than did the lazy animal between the shafts, without once stopping at the end of the lane which led from the high road to the cottage.

The anxious wife and daughter were beginning to grow weary with that "hope deferred which maketh the heart sick," when at length, one morning while Mary Talbot was in the garden busied in culling a nosegay of autumn flowers to adorn the breakfast-table, before her mother should make her appearance down-stairs, she saw the well-known donkey-cart draw up at the end of the lane, and presently Dame Upchurch was seen slowly approaching towards the cottage.

Instantly the young lady dropped the flowers, exclaiming, "A letter from papa at last!" Then recollecting many previous disappointments, she added, "Perhaps, though, it is only from Henry. Mamma wrote to Eton the other day."

Still, however, hopeful that there might be a letter from her father, she sprang to the garden gate, flung it wide open, and flew half-way down the lane to meet the slow-creeping post-woman.

"Oh, Nancy, so you've brought us a letter at last! Where is it from? We have been looking for a letter from the East Indies—oh, so long!"

"T'poastage be hääf a crown, miss," mumbled the old dame, fumbling meanwhile in her bag to find the letter. "It ha' coom vrom vurrin parts, aw reckon, vor 't ha' a mort o' poastmäarks on't."

"It is from India, then!" cried the young lady gleefully, and almost ready to weep with joy. "It is from dear papa," she went on, as she seized it from the old dame's hand, and recognised the superscription.

"Come in doors, Nancy, till I get you the money; and, if you like to go to the kitchen, cook shall give you your breakfast. You must be tired after your journey; and you can bring your cart up the lane, and hitch the donkey's halter to the gate-post."

"Thank'ee, miss," replied Nancy, as she followed the young lady up the gravel-walk to the house. "Donkey'd staun a' day wheer un be if aw'd let un, an' aw'm used t'journey, though moy owd legs bean't zo strong as 'em weer. Aw'm thinkin', miss, as arter t'year aw'se turn t'donkey-cairt ower to moy dääter, an' rest m'owd boanes vor t'remaid o' my days."

By this time they had entered the house: Mary Talbot gave the old dame half-a-crown, and sixpence for herself, and sent her to the kitchen to get some breakfast; and, this done, went to seek her mother.

Mrs. Talbot, however, had seen Nancy Upchurch enter the garden, from her dressing-room window, and came out to meet her daughter on the stairs.

"A letter from India at last, mamma!" cried Mary, triumphantly exhibiting the letter, as she and her mother

descended the stairs together, and entered the parlour, where Mrs. Talbot eagerly received the letter from her daughter's hand.

She quickly broke the seal, after a glance at the well-known handwriting on the outside; and a flush of colour overspread her pale cheeks, and her eyes brightened, as she pored over its contents, while Mary stood looking on, unwilling to interrupt her mother, yet burning with impatience to learn what news the letter contained.

At length, unable longer to curb her impatience, she cried—

"Oh, dear mamma, how slowly you read! Tell me, is papa really coming home?"

"He is, my love. He is on his way," replied Mrs. Talbot, her eyes glistening with delight as she looked up into her daughter's face. "You shall read the letter yourself, presently," she continued. "Your papa sailed from Calcutta on the first of September; but deferred writing until he reached the Mozambique, as he could not be certain, until then, whether he was to sail direct for England. Let me think. This is the twentieth of October. Nearly two months have elapsed since he sailed from Calcutta. The ship must have doubled the Cape of Good Hope by this time."

She resumed the perusal of the letter, but presently again addressed her daughter.

"Ah, here he writes—'You may expect to see me at home early in December, if we make a good run from the Cape; and the *Andromache* is a fast sailer, if she has anything like fair wind and weather. How glad I shall be to see you and the dear children again!'"

Mrs. Talbot finished her reading without further remark, and then handed the letter to Mary, who withdrew to the window to obtain a better light, and immediately became absorbed in its contents; but the letter was crossed, and, impatient as she had been while her mother was reading, it occupied her a long time to decipher the close writing.

The contents of the letter, however, were simply such as a fond and long-absent husband and father would naturally write to his wife and children. There were loving expressions oft-times repeated, and anxious hopes and fears, and questions relative to family matters, which had as well been left unwritten, since they could not be answered until the writer stood in the presence of the loved ones. But the gist of the letter may be comprised in a few words.

Captain Talbot was coming home. The voyage, though long, had been exceedingly prosperous, and one more such voyage would enable him to retire with an ample fortune, and spend the rest of his days in the bosom of his family, and the society of his wife and children.

This was all. But it was sufficient to inspire the wife and daughter with hope and joy.

Mrs. Talbot only wished that her husband would retire at the termination of his present voyage. Though in good health when the Captain left England, she had been a long time ailing, and she fancied that her illness was attributable, in a great measure, to the anxieties natural to a sailor's wife during her husband's absence at sea, and that she would soon recover her health, were those anxieties removed for ever. She felt that she could be well content with the independence her husband had already gained, could she persuade him, on his return, to remain on shore with her for the future.

The chief portion of Captain Talbot's wealth, however, was embarked on board his ship. Not only had he a large amount of money on board, but he had likewise,

on the very eve of sailing, invested several thousands of pounds in the purchase of cargo, which he was aware would realise a vast profit in England; and, in a postscript to his letter, he mentioned his great regret that he had, in the hurry of departure, omitted to insure his own property (though the ship and general cargo were fully insured), before he sailed from Calcutta.

"I have been inexcusably careless and neglectful," he wrote, "in omitting to insure the large amount of property I have on board belonging to myself. I was so much occupied in Calcutta with business relating to the ship's cargo, and other matters, that I put off the insurance from time to time, until at length, in the hurry and bustle of departure, I forgot it altogether until the ship was clear of the Hooghly river and in the Bay of Bengal, when, of course, it was too late, since there is no possibility of effecting an insurance at any port in the Mozambique.

"I trust, however, that all will be well, and that, with the blessing of Providence, my usual good fortune will attend me. Still it is not a pleasant thing to feel that, if any accident should befall the ship, those whom I best love must suffer for my unpardonable neglect."

"How foolish of papa to annoy himself about insurance!" said Mary. "As if anything in this world would be of any value to us if any harm were to happen to him. I'm sure," she continued, "I should think little of any other misfortune in such case. Besides, papa's sure to bring his ship safely home. Hasn't he always done so? And isn't he known as one of the most able navigators among all who sail to and from the East Indies?"

"Your dear papa has always been very fortunate at sea, my love," replied Mrs. Talbot. "As he says, Providence has hitherto blessed his endeavours, and we will hope and pray that the blessing of that good Providence may still attend him, and bring him home to us in health and safety. But the sea is a fearful element, and sometimes all the skill and courage of man are of no avail against the fury of the tempest."

"One would think, mamma," said Mary, somewhat pettishly, "that you foreboded evil just because papa, in his hurry, has neglected to insure his property."

"No, my dear Mary," returned Mrs. Talbot, "I do not forebode evil. I hope and trust, and believe, that, under the guidance of a kind protecting Providence, your dear papa will return to us as he has hitherto done, in health and safety; and little indeed would I value the wealth of this world if my husband did not share it with me."

"Mamma, I hardly thought what I said," replied Mary, approaching her mother and kissing her cheek.

"I know you meant no harm, my love," said Mrs. Talbot, returning the embrace; "and now," she added, with a smile, "we'll put aside all doubts and fears, and look forward hopefully to the day when your papa will once more be with us."

But, though Mrs. Talbot had said truly that the world's wealth would be valueless in her eyes if her husband were not with her to share it, she could not help feeling somewhat anxious for her children. She seemed to have an intuitive knowledge that she would not long be spared to watch over them, and she shrunk, in spite of her faith and trust, from the thoughts of their being left, in the first flush of youth, and accustomed from infancy to every comfort and luxury that a sufficient income could provide, orphaned of both parents, and exposed to the temptations and miseries of poverty. She wished that her husband had not neglected

to insure the property he had embarked on board his ship, and felt the weight of an additional anxiety upon her mind. Still she strove to banish these thoughts, and blamed herself for her lack of faith and trust in God, and at length almost succeeded in entirely banishing her fears.

The welcome letter was read and re-read; the servants were informed that their master was coming home, and seemed almost as much pleased as were their mistress and her daughter. They had been many years in the Captain's service, and he had never returned from a voyage without bringing to each and all some substantial, tangible proof that no one connected with the home he loved was forgotten by him while he was absent from it. A letter was written to Henry Talbot at Eton, to acquaint him with the glad news, and old Nancy Upchurch was commissioned to bring a copy of the "Shipping Gazette" from the post-town regularly until the Andromache should be reported as having arrived at Portsmouth.

The invalid wife improved daily in health, for hope and happiness reigned paramount at Rose Cottage. Although the cold and cheerless winter would soon be at hand, the sun seemed to shine more brightly upon its inmates, the birds to carol more blithely in copse and hedge-row, the few autumnal flowers that remained in the garden to linger longer than usual in bloom, and to shed a more exquisite perfume, and all nature, animate and inanimate, to rejoice with them in their joy.

Then, as the day drew near when the ship was expected to arrive, the cherished *dii penates* of the household—most of which were presents brought home by the Captain at different times from distant lands—were arranged and re-arranged to suit their fancy. Each seemed to remind the mother and daughter of some former happy return, and to reassure them that he who had then returned to them in safety would so return again; and if sometimes—as a passing cloud will momentarily obscure the sunshine on the fairest summer day—a slight shadow of anxiety darkened their hope, neither would permit it to dwell upon them.

It was a fine time for old Nancy Upchurch, for the old dame always contrived to reach the cottage with the newspaper at the breakfast hour, and was thus sure of a good breakfast in the kitchen; besides which she frequently received a trifling gratuity from one or other of the ladies, as a recompense for extra trouble.

Still week after week passed away, and no tidings of the Andromache appeared in the columns of the "Gazette." Nor was there anything remarkable in this, since the Indianman was famed as a fast-sailing ship, and was as likely as not to report her own arrival at Portsmouth.

At length, however, on the 2nd of December, the following paragraph appeared in the list of "Ships spoken at sea."

"Off Cape Finisterre, on the 24th ult., by the clipper-schooner Swallow, of Liverpool—Mason, master, arrived at that port on the 1st, with fruit from the Mediterranean—the ship Andromache, of London, Capt. Henry Talbot, eighty-nine days from Calcutta. All well."

Mary received the "Gazette" from the old post-woman, as usual. In a moment her rapid glance lighted on the paragraph, and, springing away into the parlour, eager with excitement, she cried—

"Good news, mamma! Good news at last! Papa's ship has been spoken, off Cape Finisterre, on the 24th. Listen, mamma," and she read the paragraph aloud.

"Where is Cape Finisterre?" she went on. "Ah, I recollect: on the coast of Portugal."

An atlas was produced, and the map of Europe

consulted, and the distance between Cape Finisterre and Portsmouth was computed.

"It cannot be more than eight or nine hundred miles, mamma," cried Mary. "Eight days ago! This is the 2nd of December, and the vessel that spoke the *Andromache* has arrived in port. Why, papa may arrive to-morrow—perhaps to-day!" and she clapped her hands with delight at the thought, and skipped about the room like a child.

Mrs. Talbot, though pleased at the news, was, however, less sanguine than her daughter as to her husband's immediate arrival. The wind had been easterly for several days, and consequently adverse to ships bound up Channel; and she had been a sailor's wife long enough to know that clipper-schooners such as the *Swallow* can sail, as sailors say, "almost in the wind's eye," and make good headway, when heavy ships, such as the *Andromache*, are scarcely able to make any progress.

Still, withal, she felt that it was possible that her husband might make his appearance at any moment. He was just the man to land at Portsmouth, leave his ship in charge of the pilot, and take a seat in the stage for Salisbury, without announcing his arrival by letter, and he could easily hire a conveyance from Salisbury to Codford.

So, throughout the bleak December day, the expectant wife and daughter sat at the window and watched, and fancied that every sound of wheels on the hard frozen highroad came from the vehicle that was bringing home the long-absent husband and father; and when the short hours of daylight were over, and night closed in, they would not close the shutters, but set a lighted candle in the window to guide the wanderer to his dwelling, should he arrive in the darkness.

"Papa will think it a beacon-light," said Mary; "but he will know who are the watchers. 'Rose Cottage light' we will tell him it is. Oh, mamma, mamma, I do so wish he may come home to-night."

"I don't think it likely, my love, though it is possible," replied Mrs. Talbot. "The wind is still from the east; it may be some days yet ere the ship arrives in port."

It was midnight ere they sought their chambers. The candles were then set in the bed-room windows; but, though they went to bed, a long weary hour elapsed ere they could compose themselves to sleep. Wearied with the hopeful anxieties of the day, they at length slept soundly. At four o'clock in the morning Mary was awakened by a violent storm of wind and rain, and, springing out of bed, she threw a cloak around her and went into her mother's room, where she found Mrs. Talbot already up and dressed.

"Mamma," she whispered, in an awe-struck voice, "hark how the wind blows! The cottage seems to rock from its base. And hear the rain! Is it not terrible?"

"It is, my dear. It woke me an hour ago, and I rose and dressed myself. The gale must be fearful in the Channel. I hope the *Andromache* is not near the coast!"

"Perhaps she is already in port, mamma. She may have arrived last night, before the gale came on."

"Yes, love, may be; I hope so: yet I fear, Mary."

"If not, papa would not run in to the land if he saw signs of a gale. I recollect to have heard him say so, mamma. Listen to the frightful wind that is blowing now. Ah, it lulls again!"

"Yes, he was ever cautious," murmured Mrs. Talbot, as a furious squall that threatened to blow down the house subsided. Then louder to Mary, "If I could be

sure he had plenty of sea-room, I would have no fear for such a vessel as the *Andromache*."

"Mamma, papa is a skilful sailor. He thinks nothing of a gale of wind. Depend upon it, if he is not safe in port, he will keep well out to sea. Remember, mamma, how, only yesterday, when we heard that his ship had been spoken, you said that you had a firm trust in Providence. Retain that trust, mamma."

"I do, love; at least, I try. But hark at the wind again!"

"Papa may, after all, be snugly asleep in the inn at Portsmouth, mamma," replied Mary.

And so, seeking to comfort each other, yet feeling that they stood in need of comfort that neither could impart, the anxious wife and daughter sat, their arms wound round each other, till day-dawn, listening with fear and trembling to the furious wind and fast-falling rain.

But, though daylight came at last, it brought with it no relief. The gale continued to increase in violence. The storm which that night burst upon the English coast swept over the Channel with the fury of a hurricane, and was long remembered with pain and sorrow. Its violence was felt far inland. Houses and barns were unroofed. Trees that had withstood the storms of centuries were uprooted by the force of the wind. Coaches were blown over on the roads; bridges were swept away by the swollen streams caused by the torrents of rain by which the tempest was accompanied; cattle and sheep were drowned by hundreds; many human beings perished, and property was destroyed to an incalculable amount. But it was on the Channel coast that the main force and fury of the gale were expended. Vessels in harbour were cut down, and sunk at their anchors, when their crews fancied they had gained a haven of safety. Other vessels were driven on shore; many foundered at sea; boats were crushed against the wharves; and the streets of the various seaports were inundated by the unprecedented rising of the tide. It was long before the mischief wrought at sea was fully known. For two days and nights the wind continued unabated in its violence, and during that period no ships sailed from port, nor did any arrive, save in a dismantled and almost wrecked condition.

Terrible was the anxiety of those who had relatives or friends at sea, within the range of the storm, and none of these suffered more than the late hopeful, happy inmates of Rose Cottage. Such was the severity of the gale in their immediate neighbourhood, that old Dame Upchurch, who, for more than thirty years, had never failed to make her daily journey to the post-town and back, was detained at home. No letters nor newspapers were therefore received by the inhabitants of the village, and Mrs. Talbot and her daughter were left to linger in suspense, unable to learn what disasters had occurred at sea. It was not until the second day after the storm had subsided that they received their missing copies of the "*Shipping Gazette*." But no letter was received with the newspapers. Amid all their trouble and anxiety and terror, they had clung, as a drowning man will cling to a straw, to one desperate hope, which was that the *Andromache* had arrived in port before the gale commenced. Now this hope was torn from them—though, had Captain Talbot arrived in port, he would most assuredly have written, in order to quell his wife's and children's anxiety, even if he had been unable to leave his ship.

The *Andromache*, then, had not arrived.

With the courage of despair they glanced over the columns of the "*Gazette*," filled with sad accounts of

shipwreck and loss of life, and felt relief when they found that there was no mention of the Indianman.

"Hope springs eternal in the human breast."

They began to gather courage. The *Andromache* was a staunch ship—Captain Talbot a skilful seaman, with experienced officers and men under his command. They persuaded themselves that, foreseeing the approach of the gale, he had not ventured near the land, or that, perhaps, he had put into some port on the coast of France. That would account for his long delay after the arrival of the *Swallow*.

The next day's "Shipping Gazette" encouraged this hope. An editorial paragraph ran thus:—

"Great anxiety has been felt respecting the *Andromache*, Indianman, Captain Talbot, which vessel was looked for at Southampton for some days before the late terrific gale commenced. This anxiety has been in some degree allayed by the report of Captain Somers, of the *Lapwing*, West India mail-packet, which came into port last night in a disabled condition; in fact, almost a wreck. Captain Somers reports that, on the first day of the gale, he saw a large vessel, which he believes to have been the *Andromache*, lying to, about fifty miles west of Cape Ushant. The ship had lost her mizen and fore and main top-gallant masts; but she appeared to be making tolerable weather. The captain says that, in all his long experience, he has never witnessed so severe a gale, nor such a tremendous sea."

The anxious wife and daughter comforted themselves with the hope thus afforded them, for two days longer, refusing to acknowledge, whatever may have been their secret fears, that any serious accident had happened to the *Andromache*, and still looking every hour, every minute in the day, for Captain Talbot's arrival; but the delusive hope upon which they had fed was soon succeeded by blank, crushing despair. A few brief lines in the newspaper sufficed to tell the terrible story, how more than a hundred human beings, crew and passengers included, met their death, and passed in one short hour from time into eternity.

"It is our painful duty," again wrote the editor, "to state on the too sure authority of the keepers of the Lizard Lighthouse, that shortly after daybreak on the morning of the 4th inst., when the gale had reached its height—a large frigate-built ship was seen to go on shore on a reef a few miles from the Lizard Point.

"The keepers watched the fearful sight from the gallery of the lighthouse; but so terrific was the force of the gale, and so tremendous the sea, that it was utterly impossible to render any assistance to the unhappy crew, who battled manfully with their terrible fate to the last moment. Again and again the ship was veered round, and held off from the fatal reef. At length, however, the vessel's masts went by the board. She became utterly unmanageable, and was swept with furious force right on to the pointed rocks. She fell over on her beam-ends, and in a moment every soul was swept from her decks. The sea made a clean breach over her, and in less than a quarter of an hour she parted midships and became a mass of broken timbers; but, long before this, all on board had met a watery grave.

"The tide was turning when the ship struck, and all the bodies were washed out to sea; but from several pieces of wreck and cargo that subsequently floated on shore, and have since been picked up, there remains not the slightest doubt that the hapless vessel was the *Andromache*, East Indianman, commanded by Captain Henry Talbot, formerly of the Royal Navy, which vessel has been for some days past expected at Portsmouth from Calcutta.

"The *Andromache* had on board a crew, officers and men, all told, numbering sixty souls, and forty-five passengers, none of whose names have yet been ascertained; but there can exist no doubt that all have perished. The general cargo, we are informed, was very valuable, and was, together with the ship, fully insured; but we learn from the underwriters at Lloyds that, by some oversight, a large amount of specie, and several tons of private cargo which belonged to Captain Talbot himself, were—as per advices from Calcutta—uninsured."

This was all that was ever known respecting the loss of the ill-fated *Andromache*. Not one of her crew or passengers escaped to tell the fearful story of the shipwreck, though, of course, the names and conditions of the lost passengers became known in process of time.

The same newspaper which conveyed to the lately hopeful and happy wife and daughter the dread intelligence that their sole earthly hope and stay was lost to them for ever in this world, likewise conveyed to them the sad news that with the husband and father they had lost all their worldly wealth.

As it was afterwards learnt, Captain Talbot had been engaged in very heavy speculations in India, in which he had embarked the whole of his means. These speculations had proved successful, even beyond his most sanguine expectations. All his worldly wealth was on board his ship, and the one act of negligence which, as though he had foreboded evil, he had spoken of with regret in the last lines he had ever penned to his wife and children, had reduced them from independence to poverty.

Henry Talbot returned home on hearing of his father's death, to find his mother on her dying bed. The terrible shock she sustained proved too much for her already enfeebled frame, and she died only a few weeks after the loss of the *Andromache*, leaving her son and daughter, comparatively speaking, almost penniless; and, so far as she knew, without a friend able and willing to aid them—without a relative, at the same time, able and willing to acknowledge the claims of kinship, in all the wide world.

THE NAUTICAL ALMANACK.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

Of the numerous almanacks that are published in England by far the first in scientific and national importance is the "Nautical Almanack," published by the Board of Admiralty for the use both of astronomers and of seamen. As this almanack is less popularly known than many others in common use, some account of its origin and history, its contents and uses, may be acceptable to the readers of the "Leisure Hour."

Before astronomical observations were made with the precision of modern days, and when the art of navigation consisted mainly in a knowledge of the coast line, much scientific attention was given to that great national problem, the discovery of a method for determining the longitude at sea. The subject was considered of such importance that the Government of the day, in 1714, offered a reward of twenty thousand pounds for an easy, practical method available for nautical purposes. Since that time hundreds of impracticable schemes have been forwarded to the Commissioners of the old Boards of Longitude, each author apparently appearing satisfied with his solution of the problem, and of course claiming the reward. The investigations were not confined to one class of scientific men. We have lately had occasion to look over a huge manuscript volume of these

documents, and have been considerably astonished at the great ingenuity displayed by men of all ranks of intellect, some exhibiting great mathematical power, others plainly showing the results of the minds of illiterate, but original thinking men. Some, however, contain only wild fancies of the writers. Still the question was not even partially solved to the satisfaction of the authorities till the remarkable improvements made in the construction of clocks and chronometers by John Harrison. In 1758 this celebrated mechanician produced a chronometer which was sent on a trial voyage to the West Indies. After an absence of little more than five months, the error of the chronometer was found, on its return, to be only sixty-five seconds. For this remarkable success, which was the first practical step in the accurate determination of the longitude at sea, Harrison received a reward of five thousand pounds. This grant was afterwards increased by an additional sum of ten thousand pounds, other chronometers having been constructed for the Board of Longitude with equal accuracy. On one occasion Stukely, the antiquarian, paid a visit to the workshop of Graham,* then a celebrated clock and instrument maker, to view a wonderful time-piece by Harrison, which is probably one of those still preserved at the Royal Observatory. Stukely relates: "I saw Harrison's famous clock last winter at Mr. George Graham's; the sweetness of its motion, the contrivances to take off friction, to defeat the lengthening and shortening of the pendulum through heat and cold, and to prevent the disturbance of motion by that of the ship, cannot be sufficiently admired."

To make Harrison's invention a complete success it was necessary that predicted places of the sun and moon should be published some time beforehand, so that when observations were made at sea they might be compared directly with the computed lunar distances from the sun and principal stars, determined from the best tables extant. Hence the origin of the "Nautical Almanack." It owes its actual existence to a memorial presented to the Commissioners of the Board of Longitude by Dr. Nevil Maskelyne, Astronomer Royal, on February 9th, 1765. This memorial was supported by several officers of East India ships, who had lately made use of a work compiled by Dr. Maskelyne, entitled "The British Mariner's Guide to the Discovery of the Longitude at Sea and Land, within a degree, by Observations of the Distance of the Moon from the Sun and Stars, taken with Hadley's Quadrant." These officers all agreed in testifying that they had made observations according to the rules laid down in this book at various opportunities, and that "they had found the said observations easily and exactly to be made; so that the longitude resulting always agreed with the making of land, near the time of making the observations, to one degree; and that they could make the calculations in a few hours, not exceeding four; and they are of opinion that, if a nautical ephemeris were published, this method might be easily and generally practised by seamen." This memorial of Dr. Maskelyne had the desired effect, for a nautical ephemeris was at once ordered to be compiled and printed.

Shortly before this time M. Mayer, a German mathematician, had constructed lunar tables by means of which the place of the moon in the heavens could be computed for any stated time. Owing to the decease of Mayer,

* It is worthy of remark, that there are several clocks constructed by Graham still in use at the Royal Observatory. Some slight modifications have, however, been made in some of them. He also made the mural arc and the zenith sector with which Dr. Bradley made important astronomical discoveries. These instruments are also preserved at Greenwich.

these tables remained in manuscript. In order that they might be made more useful in the calculation of the new almanack, they were printed at the expense of the British Government, and an application was also made to Parliament for a grant of money to Mayer's widow. She afterwards received a reward of three thousand pounds. The celebrated mathematician Euler assisted Mayer in the theoretical portions of his work, for which the Government gave him three hundred pounds. Dr. Maskelyne was appointed superintendent of the new ephemeris, an office which he retained till his death in 1811.

The first "Nautical Almanack" was published in 1766; it was available for the following year. About twelve months only were occupied in its calculation and preparation for the press—a marvellously short time when it is considered how difficult the arrangement of a novel work of this kind must have been. The first number will ever remain as a great memorial of the skill and industry of the originator. It was announced to the public as follows:—"The Commissioners of Longitude, in pursuance of the powers vested in them by a late Act of Parliament, present the public with the Nautical Almanack and Astronomical Ephemeris for the year 1767, to be continued annually; a work which must greatly contribute to the improvement of astronomy, geography, and navigation. This ephemeris contains everything essential to general use that is to be found in any ephemeris hitherto published, with many other useful and interesting particulars never yet offered to the public in any work of this kind."

By the publication of the "Nautical Almanack" for 1767 and subsequent years, and by the continual improvements in the construction of chronometers, the longitude at sea was practically determined with moderate accuracy at the close of the last century. At the present time, astronomical observations have been the means of so far improving the lunar and planetary tables that they may be said to have, in conjunction with the use of the beautifully-made modern nautical instruments, conclusively disposed of this great problem, for the solution of which so large a reward had been offered.

During Dr. Maskelyne's superintendence of the "Nautical Almanack" its success was complete. It was annually received with eagerness by seamen, and it gained not only the approbation of the naval service, but also of all lovers of the science of astronomy, in England and on the Continent. The French *savant*, M. Lalande, remarked that "there are almanacks published at Bologna, Vienna, Berlin, and Milan; but the 'Nautical Almanack' of London is the most perfect ephemeris I have ever seen."

On the death of Dr. Maskelyne, the superintendence remained in abeyance for some years, being in the hands of no responsible person. No wonder that the reputation which the almanack had attained in his lifetime was soon lost. It became inaccurate and incomplete, and could no longer bear a favourable comparison with the productions of other countries. Astronomical knowledge had been remarkably progressing; but the "Nautical Almanack" remained not only stationary, but retrograded. The attention of Government having been drawn to this state of its affairs, the question was referred to a new Board of Longitude appointed in 1818, of which Dr. Wollaston, Captain Kater, and Dr. Thomas Young were a resident sub-committee. Towards the end of that year, Dr. Young was made secretary to the Board, and superintendent of the "Nautical Almanack." The first volumes published under his direction did much to retrieve its character; but the irregular system

employed in making the calculations left no hope of any permanent improvement being effected without some radical change in its personal organisation. It is a remarkable fact that the computations were made in different parts of the country. It seems almost incredible that, in a time of slow travelling and expensive postage, a system in which all the calculations had to be transmitted several hundred miles to be verified, should have continued so many years without any attempt at centralisation. The father of the writer of this article, resident at Truro, Cornwall, was one of these scattered computers from 1800 till his removal to London, in 1832, being responsible for five months' computations of each year.* We can well remember, in our early days, the extra labour borne by him in preparing duplicate copies of his work, to be transmitted to the examiner in Derbyshire, and the length of time which necessarily elapsed before any answer could be expected. His subsequent experience in the "Nautical Almanack" office in London formed a great contrast to this irregular manner of producing the national ephemeris. As an illustration of the scattered residences of the computers in 1828, we may state that one lived at Arbroath, Scotland; another at Truro; a third at St. Hilary, near Marazion; a fourth at St. Mabyn, Cornwall; a fifth (a lady) at Ludlow, Shropshire; and a sixth at Tideswell, Derbyshire. Dr. Young, the superintendent, resided in London.

After the death of Dr. Young, which took place in 1829, a proposition was laid before the Council of the Royal Astronomical Society by the Lords Commissioners of the Admiralty, with a request that they would take into consideration the advisability of forming some plan by which the "Nautical Almanack" might be prepared more in accordance with the advanced state of astronomical science. In conformity with this request, a committee consisting of the principal members of the Society was appointed. They recommended that an office should be established in London, in which all the calculations should be made; also, that there ought to be a complete change in the form and contents of the almanack, making it at least double in size, and adding valuable matter useful to the astronomer. The proposed alterations were adopted by the Council of the Astronomical Society, November 19th, 1830, and subsequently ordered by the Government to be carried into effect.

In the first series of the "Nautical Almanack," up to 1833, the information was intended principally for maritime purposes, but not wholly so. That portion, however, inserted for the benefit of astronomers, was not sufficiently accurate for comparison with the observations, and consequently was practically useless for all delicate researches. One great object of the committee was to recommend that in the new series the positions of the sun, moon, and planets should be calculated with the precision which the best modern tables would allow. Then, with regard to the improvement of nautical astronomical observations, it was considered that the determination of the position of a ship at sea ought not to

be the only object of a seaman's solicitude, because that might be attained by a much smaller work than the "Nautical Almanack," and by the use of very inferior observing instruments. But the committee also considered that an equally important branch of nautical astronomy, consisting in the exact determination of the position of well-known points on the earth's surface, should also be provided for. These observations cannot be effectually and properly executed by methods available only on board a ship, but by delicate instruments placed firmly on solid ground. Observers in this position require all the astronomical aid which can be given them from the best tables, arranged in a form most convenient for practical and immediate use. In the new series of the "Nautical Almanack," the first volume of which was for 1834, this two-fold object has always been kept in view. Thus the seaman can still find everything he requires, and the astronomer at the same time has at his fingers' ends the tabular positions of the principal stars and planets for every day in the year. This enables the latter to point his telescope at any hour of the day or night to the celestial object selected for observation, and then to compare the results of his labours with the numbers previously computed. He is thus continually keeping a check on the lunar and planetary tables used in the construction of the "Nautical Almanack," and providing fresh data for their correction.

The result of the deliberations of the committee of the Astronomical Society having been adopted by the Government, an office was established in London in 1831, since which time the whole of the calculations have been made there. The superintendence after Dr. Young's death was temporarily undertaken by Mr. Pond, at that time Astronomer Royal. On the formation of the new office, Lieutenant Stratford, R.N., was appointed superintendent, assisted by a staff of skilled computers. The office is at present in Verulam Buildings, Gray's Inn, the director being the well-known astronomer, Mr. John Russell Hind, who succeeded Mr. Stratford in 1853.

Now that we have given a brief history of this truly national book, we propose to take a rapid glance through its contents—not, however, with a critical eye, but with a desire to explain in a few popular words what would probably appear unintelligible to most readers on the first inspection of its pages. Let us commence by turning the leaves over rapidly from the beginning to the end of the volume. Nothing is visible but an immense assemblage of figures. To those, however, who understand their use, every one of these figures has its peculiar significance. Every line we see before us is the result of a long and laborious calculation, nothing being printed but what is absolutely necessary. The tables from which nearly all the work is now computed have been originally constructed from the labours of the astronomical observer, principally, however, from the observations of the sun, moon, and planets made at the Royal Observatory, Greenwich. Hence the solar tables by M. Le Verrier, the lunar tables by M. Hansen, the tables of Mercury, Venus, and Mars, by M. Le Verrier, and others, depend almost entirely on the Greenwich astronomical observations of the last hundred years. It is from this cause that a popular error exists in the minds of many persons that the home of the "Nautical Almanack" is at the Royal Observatory.

The almanack may be divided into two divisions, one to be used by seamen and astronomers, the other by astronomers almost exclusively. The first division may be termed the monthly section, because here the matter for the different months is arranged according to one plan,

* It may not be amiss to state here that Mr. William Dunkin was an early boy-friend and school companion of Sir Humphrey Davy, both natives of Penzance, Davy being the senior by three years. The attention of Mr. Davies Gilbert, M.P., afterwards President of the Royal Society, was drawn to both of these youths on account of their scientific tendencies; one for chemistry, the other for mathematics and astronomy. He gave them the use of his valuable library at Tredrea, his seat near Penzance. The brilliant career resulting from the introduction of young Davy to the Pneumatic Institution at Bristol, in 1798, is well known to all. Mr. Gilbert afterwards placed young Dunkin under the care of the Rev. Malachy Hitchins, at St. Hilary, Cornwall, then computer of the "Nautical Almanack" under Dr. Maskelyne. Mr. Dunkin soon became one of the principal computers of that work, in which employment he remained till his death in 1838.

the whole being divided into twelve sub-sections under the names of the months. We will now briefly go through one of these sub-sections. Let us take as an example that for January, 1868. First, we have no calendar containing the ordinary information of popular almanacks, nothing more indeed than the days of the week and month. On the first opening we have the exact position of the sun in the heavens at Greenwich noon of each day, with some other information useful to seamen as well as astronomers. On pages 4 and 5 of each month the longitude and latitude of the moon is given for each day at noon and midnight, and of the sun for noon. The time of the moon's southing, and the angular value of the moon's semi-diameter and parallax, are also given. Pages 6 to 13 are occupied with the right ascension and declination of the moon for every hour throughout the month. Pages 14 to 19 contain the distances of the sun, planets, and principal stars from the moon for every three hours. These lunar distances are inserted solely for the benefit of mariners; and it is by the comparison of the observed lunar distances with those corresponding in the almanack that the longitude at sea is generally determined. Travellers also, when in unknown lands, have availed themselves freely of this portion of the volume. M. du Chaillu made an extensive series of observations of lunar distances during his late journey into Ashango Land. The geographical positions of some of the stations visited by him have therefore been determined with considerable accuracy. The late Captain Speke also used this method for determining longitudes in his explorations from Zanzibar to Lake Victoria Nyanza. The writer is able to form an opinion on the value of such observations, from a careful examination of the astronomical labours of these and other African travellers, and from the valuable geographical results he has obtained from the discussion of their observations. Pages 20 and 21 of the sub-sections contain the data for accurately computing the position of the fixed stars, useful only to the astronomer. These occupy the last pages of each month's information. This first division of the "Nautical Almanack" absorbs one half of the volume.

The second division of the work is intended purely for the use of the astronomer, and is prepared for the meridian of the Royal Observatory. It is, however, easily adapted for use at other observatories, by applying small corrections depending on the difference of longitude. We will endeavour to exhibit the contents of this division in as few words as possible. 1. We have the positions, as viewed from the sun and earth, of the planets Mercury, Venus, Mars, Jupiter, and Saturn, given for Greenwich noon of each day, and of Uranus and Neptune each fourth day. By means of the daily positions of these planets, particularly of Venus and Jupiter, the latitude, time, and variation of the compass, may be found with nearly as much facility and accuracy as by the sun. 2. The same information for the large planets, and a few of the minor planets, at the moment of transit across the meridian of Greenwich. 3. Standard places of 147 of the principal fixed stars given for every ten days throughout the year. Several of these stars, with some others, are used at Greenwich as clock-stars, from the observation of whose transits true Greenwich time is found daily. It is scarcely necessary to draw attention to the national importance of these observations, as it is now generally understood that the time of all the clocks in the country is indirectly kept in order by this daily reference at Greenwich to the great star-clock of the heavens. The mechanical and electrical arrangement made for the dissemination of true time

from the Royal Observatory to all parts of the country, now forms a most important part of the daily duties of that establishment. 4. Forty pages of the second division are occupied with the apparent positions of the moon, and of certain selected stars near her, at their respective times of Greenwich transit. By the corresponding observation of these objects on different parts of the earth's surface, a very accurate method for the determination of the difference of longitude between any two places is obtained. 5. The remaining portion of the book contains principally full details of all miscellaneous phenomena. First we have eclipses visible in 1868, with the elements of calculation. Then a list of stars occulted or obscured by the moon passing over them. These are succeeded by an extensive list of the phenomena of the moons of the Jovian system, consisting of eclipses in the shadow of Jupiter, transits over its disc, disappearances behind the body of the planet, together with the dark shadows of the satellites on the planet. Accurately computed times of the principal phenomena are given, and approximate times for the remainder. The concluding portion of the almanack contains a list of the principal planetary phenomena; elements of Saturn's ring; the libration of the moon; time of high water at London Bridge daily, and at various ports and places at the full and change of the moon; a few tables used by nautical men principally; a list of public and private observatories; and finally, an explanation of the different sections of the work.

In addition to the preceding valuable matter, the almanack contains rough ephemerides of the minor planets. In the volume for 1870, and in future volumes, these are intended to be omitted, as they are published in the Berlin Astronomical Almanack in fuller detail, and consequently more useful to the astronomer.

The United States of America also publishes a "Nautical Almanack," prepared by order of Congress. It is almost a fac-simile of our own with regard to the contents, the arrangement of the tables being copied as nearly as possible from the British "Nautical Almanack." France has also its national ephemeris, known by the name of the "Connaissance des Temps." It cannot bear comparison with ours. The "Berliner Astronomische Jahrbuch" is a valuable work, especially for the great attention given to the minor planets. Several other countries have their astronomical ephemeris; for example, the Milan ephemeris, and those of San Fernando, in Spain, and Coimbra, in Portugal, are well known to astronomers.

When the new series of the "Nautical Almanack" was first published, it was established as a rule that the work should eventually appear yearly four years in advance. Although since 1834 the establishment of ocean steamers has so practically shortened the distance between opposite portions of the globe that there is no longer the same object for such early publication, yet it has been thought advisable to continue the system as originally designed. In 1867, therefore, the volume for 1871 appeared, while the computers are engaged on years still farther in advance. The annual circulation amounts to more than 20,000 copies.

HER MAJESTY'S MAIL IN THE FAR-WEST.

BY J. K. LORD, F.R.S.

"Our English post-office is a splendid triumph of civilisation." In this memorable saying of Lord Macaulay, reference is made not merely to the postal organisation of the United Kingdom. The chief office in London, the railway mail-vans, the travelling post-offices, and

HER MAJESTY'S MAIL IN NORTH-WEST CANADA.

the whole arrangements for the collection and delivery of letters, are wonderful results of well-devised organisation and ably-directed labour. In all its most conspicuous parts the machinery is so perfect, and works with such smoothness and regularity, that we are apt to forget the vastness and variety of the service. But it is not alone in the organisation and working of the home department that "our English post-office is a splendid triumph of civilisation." In the remotest bounds of the empire the service is sustained with marvellous results. Our picture carries the mind to regions whose wild solitudes were never startled by the railway whistle, nor cheered by the mail guard's bugle. Yet, even in the far-west of British America the postal service displays an energy, punctuality, and order such as may stir all other public departments to envy and emulation. The lonely English occupant of a hunting-station or fur-store in the wilds of North-west Canada, looks not in vain for the welcome despatches from "home." Where railways are not, and wheel carriages find no road to run upon, the mail is taken up by sledges, and the Indians, with their dogs, represent the officers in charge of Her Majesty's mails.

My readers will better understand the kind of out-posts and stations to which letters are conveyed, by perusing the following paragraph extracted from the "Quebec Chronicle":—"Travellers by steamer up the river Ottawa will have observed on the north shore of the Lake of Two Mountains a small village situate on a cliff, showing a face to the lake of bright yellow sand; and they have been told that they see an Indian village. The community here resident have just petitioned for the establishment among them of a post-office. The memorial has the signatures of Irroquois and Algonquin chiefs—Saoatis-kurai-iarakoen-kane-gatake, Jakomisakie, L. Sateksasenoten, Sosekatsien Haienton, B. Kekatewaje, and others. It is proposed to give the village the name of Oka."

But the postal service in Canada reaches far beyond such villages as Oka, whose population rejoices in names astounding to a London letter-carrier. During part of the year Her Majesty's mails are sometimes forwarded two thousand miles, after losing the help of all steam or horse-power.

In the summer months the mails are conveyed to all the settlements along the lake shores by steam-vessels, and these huge fresh-water seas afford every facility for a safe and rapid navigation. But when the lakes are covered with a stratum of ice, strong enough and of sufficient thickness to bear up the traffic of London, then a very different system of transport is necessitated. Contracts are entered into by the postal authorities, for the transmission of the mails, with persons who quite understand the work. Throughout all the lake districts on Lakes Huron and Superior the contracts are generally sub-let to Indians and half-breeds, who travel on snow-shoes, and pack the mail-bags upon light sleighs, which are usually tugged along by six dogs, worked in pairs side by side, as shown in our illustration. By providing frequent relays, and, at the same time, being perfect masters in the art of travel, these hardy mail-carriers contrive to transport the letters at the rate of about sixty miles a day.

It was once my misfortune, when cruising in a little schooner upon Lake Huron, to be caught in the ice, and frozen in hard and fast near a small settlement called Cas-ka-awning. As the dwellers at this desolate village had no more provisions for the six months of biting winter before them than were barely sufficient to supply their own wants, I had no alternative but to pack up a small

bundle of necessaries, put on my snow-shoes, and tramp off for the nearest place whereat I could pass the winter, leaving my vessel and my tiny crew to take care of themselves as best they could. The haven of refuge towards which I bent my steps was the Bruce mine—a copper mine situated on the north shore of Lake Huron.

Winter commences in this icy region about the beginning of October, and when once the ice has fairly "set" on the lakes, all communication with the rest of the world is entirely cut off—excepting the traveller resorts to the employment of snow-shoes and dog-sleighs—until May in the year following. As an illustration of the intensity of the cold, I may state that the carcasses of sheep, pigs, and bullocks intended to be stored for the maintenance of the miners and their families during the winter, are exposed to the air immediately after they are killed and skinned, until frozen as hard as marble. After that they are hung up in large sheds to be consumed as required. The freezing is a perfect preservative; meat so treated, if kept from thawing, would remain sound and good for years. To be eaten, a joint is chopped off with an axe, soaked in tepid water until sufficiently thawed, and then cooked in any manner best suited to the tastes of those who are going to devour it.

But my present object is to tell how, in this out-of-the-way place, our communication with the rest of the world was kept up, and to describe Her Majesty's mail in these regions.

I have sometimes travelled with the mail-carriers from place to place along the route, and I can truthfully say that it is scarcely possible to picture a more weird scene of desolation than a wide expanse of frozen lake, covered thickly with snow, presents to the eye, more especially when journeying through the night—a course generally followed if there happens to be a sufficiency of light to discover the track. Night travelling is always preferable, because the snow is less trying to eyes by night than it is during the day; hence the risk of becoming snow-blind is materially diminished. Nothing seems to retain any semblance to reality as we tramp along over the snowy waste, with the dogs trotting after, jingling their sleigh-bells. The silvery moon spreads her pale light upon the snow, and the rays, instead of being absorbed or reflected, seem, by some mysterious agency, to accumulate, until one is tempted to believe himself splashing through a shallow lake of light. Every visible object appears to be transformed into something intangible and unreal; the tracks upon the snow grow into huge proportions; trees dotted along the lake shore resemble giants such as we read of in fairy tales; a hillock of drifted snow takes the appearance of a mountain. Now one fancies rippling water is directly in the path, which, on a nearer approach, proves to be only snow ridged by the breeze, reflecting the light from the burnished facets of its myriad crystals. Anon, you feel certain that a deep ravine is directly in the way, the gloomy depths of which will have to be traversed; but the heart throbs more lightly when the imaginary cleft turns out to be only the shadow of a passing cloud. The silence is intense, and the listening ear fails to catch the faintest sounds, except it be the breathing of the panting dogs, the cheery tinkle of their neck-bells, and the rough crunch, crunch of the snow-shoes as they splinter the crisply-frozen crust upon the snow. How vividly these scenes come back to my memory! I can recall even now the various incidents that marked each night journey over the ice-covered waters of Lake Huron.

The arrival of the mails at the mines was so punctual,

that the day on which they were expected was kept as a kind of general holiday. The miners left their work, and the women and children their warm stoves, to group together upon the landing-place where the sleigh track led off across the lake; and it was quite a study to watch the many anxious faces gazing intently into the hazy distance, in hopes of being first to catch a glimpse of the bearers of the good or bad news, as perchance it might turn out to be, from the "old country."

The keenest and best-sighted at last proclaims the coming of the mail; others very soon make it out—a mere speck, however, as yet—moving over the snow towards the mines. Nearer and nearer the loaded sleighs approach, and soon they are at the landing, when fifty willing hands rapidly unpack the sleighs, and sturdy men rush off with the bags of letters to the primitive post-office. There is no such institution as a postman; hence the system of delivery is managed in this fashion. The postmaster unlocks and unseals the letter-bags, and tumbles their contents out upon a large table; then, picking up a letter and reading the address, he proclaims, in a stentorian tone of voice, that there is a letter for—say Jack Robinson; then Jack Robinson comes to the front, and, if there is any postage due, he has to pay it before he can obtain his letter; and so on the postmaster reads the addresses and delivers the letters until the stock is exhausted. The post-office presents a singular spectacle after the distribution of the mail, which comes only about once a month. The assembly divide into little groups, and each group has its own joys and sorrows. All is in public, compared with the privacy with which letters at home are perused. Soon the groups break up and disappear, and each goes back to his daily avocation; the Indians and the dog-sleighs take their departure; and everything settles down into the hum-drum routine of daily life at the mines, until the recurrence of another month brings about a similar scene on the arrival of Her Majesty's mail.

THE CHINESE NEW YEAR IN BATAVIA.

BY THE REV. DR. J. MUEHLHISEN ARNOLD, BATAVIA.

LIVING in this great emporium of the East, I have opportunities of observing the customs and manners of various nations. The Chinese form a large proportion of the population. I send a sketch of "The Chinese New Year in Batavia," as likely to interest the readers of the "Leisure Hour."

The chronology of the Chinese commences 2637 before Christ, and counts by cycles of sixty years each. The year 1868, according to this calculation, is therefore the fifth of the 76th cycle. The Chinese years are properly speaking *solar*; yet, since the months are always *lunar*, the year is dependent on both luminaries. The new moon which is nearest the 15° of the sign of Aquarius, when the sun enters into that sign, is always the first day of the new year.

The Chinese months are alternately large and small, *i.e.*, they have either thirty or twenty-nine days. Since, however, such a year of twelve lunar months amounts only to 355 days, there is interpolated every third year, at the time when the sun does not enter into any zodiacal sign, an "after month," an "after March," or an "after August," by which the year receives thirteen months. The sun, therefore, once more obtains the mastery; and there is a vast deal of stupid superstition mixed up with it. At a solar eclipse, the Chinese say, "The celestial dog devours the sun;" and the Emperor commands all officers of state to throw themselves into mourning, and to pray that the sun be spared

in this hour of trial. If clouds cover the sky so as to prevent the solar eclipse being seen, the Emperor receives the congratulations of the people, "because Heaven, for the sake of the imperial virtues, spares the eyes of his Majesty from so sad a spectacle!" Before proceeding to a brief description of the new year, I wish to name that the day by the Chinese is divided into twelve *shishin* instead of twenty-four hours.

The new year, which this year (1867) fell on the 18th of February, is always an occasion of unbounded festivity and hilarity, as if the whole population threw off the old year with a shout, and clothed themselves in the new with their change of garments. Preparations go on for five days before; but evidences of the approach of this chief festival appear some weeks previous. The principal streets are lined with tables, upon which articles of dress, furniture, and fancy toys are disposed for sale. You see monster frogs in coloured paper, horses, birds, crocodiles, some of them showing considerable artistic design. The expense incurred is considerable, and often curious relics are brought forth to turn into money. Superiors give presents to their servants and dependants, and shopkeepers send an acknowledgment of favours to their customers. We received sugar candy and sweetmeats. One of the most common gifts of the lower order is a pair of slippers.

Among the stands for presents are other tables at which persons are seated, provided with pencils and gilt red paper of various sizes, on which they write appropriate sentences for the season, to be posted upon the doorposts and lintels of dwellings and shops, or suspended from the halls; to which I shall presently refer.

Small strips of red and gilt paper, some bearing the word *fah*, happiness; large and small red candles gaily painted, and other things used in their worship, are likewise sold in stalls and shops. As if to wash away all the uncleanness of the past year, water is applied profusely to everything in the house.

But a still more praiseworthy custom is that of settling accounts and paying debts. The shopkeepers wait upon their customers, creditors, and debtors, to settle matters. No debt is allowed to overpass the next new year without settlement or arrangement of some sort, if it can be avoided. Many wind up by bankruptcy, and the general consequence of this great pay-day is scarcity of money, resort to the pawnbrokers, and low price of all kinds of goods and articles. As the old year departs, all the account books in Chinese shops are burned. Devout persons, of whom there are but few, also settle with their gods, and during a few days before the new year the temples are usually thronged by devotees, both male and female, rich and poor. Some fast, and engage priests to pray for them, that their sins may be pardoned, while they prostrate themselves before the images, amidst the din of gongs, drums, and bells, and thus clear off the old score. Crackers are fired off to drive away evil spirits, and the worship of the ancestors, as usual, takes the precedence.

On New Year's Eve the streets are full of people, all hurrying to and fro to conclude any business still left undone. Some are busy pasting the five papers upon their lintels, signifying their desire that the five great blessings which constitute human happiness may be theirs—namely, long life, riches, health, love of virtue, and a natural death.

Above these are pasted sentences like these:—"May the five blessings descend upon this door." Or, "May rich customers ever enter this door." Or, "May Heaven confer happiness." The door-posts of others are adorned with plain, or gilt and red paper.

In the hall are suspended scrolls, more or less costly, containing antithetical sentences carefully chosen. A literary man, for instance, would have distichs like the following:—

“May I be so learned as to secrete in my mind three myriads of volumes.”

“May I know the affairs of the world for 6,000 years.”

Other professions and tastes would exhibit sentences of a different character.

Boat people are peculiarly liberal of their paper prayers, pasting them on every board and oar in their boats, and suspending them from the stern in scores, making the vessel flutter with gaiety. The farmers paste them on their barns, trees, baskets, and implements, as if nothing should remain without a blessing. The house is neat and clean to the highest degree, and purified more than seven times by religious ceremonies or lustrations, firing of crackers—the last of which being meant, as already named, for the expulsion of evil spirits.

A great diversity of local usages is observed at this period, in different parts of China itself. In Amoy, *e.g.*, the custom of “surrounding the furnace” is generally practised. The family sup on New Year’s Eve with a pan of charcoal under the table, as a supposed preservation against fire. Supper being ended, wooden lamp-stands are brought out and spread upon the pavement, with a heap of gold and silver paper, which is set on fire, after all the demons have been warned off by a volley of fire-crackers. The embers are then divided into twelve heaps, and their manner of going out carefully watched, as a prognostic of the kind of weather to be expected the ensuing year. Many persons wash their bodies in warm water, made aromatic by the infusion of leaves, as a security against diseases. This ceremony, and ornamenting the ancestral house (of which more on another occasion), and garnishing the whole house with inscriptions, pictures, flowers, and fruits, occupy most of the night.

The stillness of the streets and closed shops on New Year’s morning is striking. The red papers on the doors have been removed. You now read sentences like these:—

“Yesterday, in the third watch, the old year passed; to-day, with music and drums, the new year begins.”

Or: “Look where you will you witness festival array; everywhere there is bowing and salutation.”

Or: “Heaven grows in years, man grows in age.”

Or “Spring fills the whole world, and fortune the house.” These gay papers are interspersed with blue ones, announcing that during the past year death has come among the inmates of the house—a silent admonition to the passers-by. In some places white, yellow, and carnation-coloured papers are employed with the blue, to designate the degree of deceased kindred. Etiquette requires the mourners to remain within doors.

In a few hours the streets begin to be filled with well-dressed persons, hastening in sedans or on foot, or here and there in carriages, to make their calls. Those who cannot afford to buy a new suit hire one for the occasion; so that a Chinese master hardly knows his own servants in their finery. Much of the visiting, however, is done by cards, on which is stamped an emblematic device representing the three happy wishes—for children, rank, and long life.

Towards evening the crowds are so dense that it is with difficulty you can make your way through them; as then the extraordinary Chinese show, called the Jenghe, is carried about on men’s shoulders. It consists of a wooden platform, oblong or square, like a huge

tray, on which a scene is erected, fairy-like and fragile in appearance, with living children perched in the most startling and seemingly impossible positions imaginable.

In driving out in the direction we knew they would pass, we suddenly came upon a moving mass of people, in the centre of which came towering along, borne on the shoulders of four natives, a large platform, over which a white goose was represented in the act of flying, with the neck stretched out, and dipping its beak into a flower, the plant of which stood in a substantial flower-pot. Thus slightly attached, the goose is made strong enough to balance a young girl of at least seven or eight years old on its tail. The girl apparently stands erect, gorgeously dressed, a lofty head-gear composed of flowers, spangles, and feathers adorning her head; but in reality she sits on an iron rod, at the top of which is a seat, to which she is firmly strapped, all being concealed by her long robe, beneath which a pair of false legs and feet complete the deception. In fact, all the designs are skillfully made of iron, so ingeniously and delicately resting on an almost invisible base, as to produce the effect of the children standing in mid-air, or only lightly touching their feet on something too frail to support them. Whilst poised up on high, they reach the upper branches of trees, and soar above the roofs of houses, with immense self-possession. They wave in one hand a long feathered wand, gracefully bowing right and left. As flaming torches at the end of long bamboo poles were carried by the attendants, from which large sparks and bits of lighted wood fell about, some on the backs of our horses, we were but too thankful to accept the kind invitation of a lady to accompany her to a rich Chinaman’s house, before which all these processions were to stop. We made our way through the crowd, and reached it before a Jenghe arrived. The large courtway in which the house stood was thronged with natives, all eager to see the sights. The verandah was crowded with self-invited guests, like ourselves, many unknown to the owner of the house, a good-tempered, sleek-looking man, who, with his sons, was busy dispensing hospitality—ordering wine, beer, and ices to be handed about, considering this influx of spectators a great compliment. A few, ourselves amongst the number, he invited to see the interior of his house. Behind the verandah was a magnificent hall, handsomely furnished with European mahogany and leather chairs and sofas, many tables, and English engravings in handsome frames round the walls. One particularly attracted our attention, being the Meet of the Vine Hounds, Hants, with the Duke of Wellington in the foreground. The rest were scenes from English history, doubtless picked up at sales, whither Chinamen always resort, and are the highest bidders. Beyond this hall was a smaller compartment, in the midst of which was a large, square, shallow lake, cleverly supplied with water from the clouds, there being no roof above it, but a thin network of wire stretched over the open space to allow the rain to fall through, which was also caught by pipes around—a most ingenious contrivance for keeping the house cool, as well as for a bath.

Beyond this marble bath-room was another spacious apartment, where two little smartly-dressed children of the host were regaling themselves with tea and sweetmeats spread on the floor, with their native female attendants also squatting by their sides. A centre table was laden with sweets and fancy dishes for the guests, and at a side-table a nice white china tea-service, with a tea-pot of newly-made hot tea, stood ready for any to help themselves. The hostess, according to etiquette,

remaining behind in a smaller room still farther back, only appeared a short time to show us the back verandah, which opened into a small garden of shrubs. Returning to the front verandah, we saw the guests there partaking of champagne, when presently another Jengeh was brought into the court-yard on bamboo poles, which supported it on the shoulders of the bearers; they then set it down on its four legs most gently and cautiously, one man carrying a kind of long crutch, which he placed under the arm of the standing girl to lessen the shock of her being lowered, and also to support her if fatigued, which only one appeared to be. This poor child evidently found her temporary elevation very painful, for she leaned from side to side in great discomfort, and was unable, either from weariness or being uncomfortably strapped into her seat, to take the cup of tea usually offered. It sadly lessened the pleasure of the scene to see her borne off, perhaps to endure this misery till dawn of day. She was also perched on a bird, but not in a more perilous position than the one just described. I will pass on to another more happy exhibition, of which the accompanying rude sketch will give some idea. In the midst of the platform rose up two small whitish rocks, which we found were intended for breakers, on the top of which was a boat, with a little child sitting in it holding a rose in her hand. A long snake, or small sea-serpent, curling its body over the end of the boat, which it only just touches at one point, thrusts its head out to the flower, and on the tail, extended in the air, stands a tall girl of eight or nine. She was perfectly composed, and gladly took a cup of tea, seeming rather to enjoy the scene, never tiring of waving her plumewand elegantly from side to side.

After resting about ten minutes, this Jengeh was slowly raised and borne off, accompanied by torches before and behind. The intervals were filled up by Malay dancers, some dressed in odds and ends of European apparel, some in snow-white garments and turbans; others in the native costume, brilliant red or amber cotton jackets. One native, shabbily dressed in a drab wide-awake and old brown cloth coat, danced and gesticulated with the others, each fanning himself before and behind in the most ludicrous manner, and making grimaces. This performance took place in a small space of less than eight feet long, for the crowd pressed round them so closely that three or four had only room just to exchange places. Then came a snake dance. A snake about the size of a man's arm, and six or seven feet long, is twined round the body of a man who, holding the neck of it in his hand, fiercely twists himself about, thrusting the head into every one's face who comes near. He then unwinds the snake and passes it on to others. Then came an Arab, with white robe and turban, who snatched up a piece of lighted wood and held it in his mouth till it went out, pretending to swallow it. This he repeated many times. One more Jengeh described will suffice to show the originality of the devices. On the platform stood a Dutch house, red-tiled and green-shuttered, like a doll's house. Behind rose what we supposed to be intended for a bridge, being a semi-arched road rising almost perpendicularly. On this stood a girl, as usual with a somewhat cumbersome and unwieldy head-dress, highly decorated, fanning herself or bowing. A smaller and younger child sits generally on the platform, as being the less dangerous situation.

These singular exhibitions, peculiar to the Chinese, are supposed to have illustrated originally some historical or mythological events, though they now vary every year. There were formerly such frequent accidents, arising from the great height to which the designs

were raised—ladders being placed on the top of a bird, we were told, and a child propped upon them, and similar extravagances—that Government interfered, forbidding erections of such a dangerous height. Parents let out their children by the night at one hundred to two hundred rupees; but, expensive and perilous as these annual spectacles undoubtedly are, they continue to be a never-failing amusement during the celebration of the Chinese New Year.

A CHINESE JENGHE.

THE READING GIRL.

In 1861 an Exhibition of Art and Industry was held at Florence. To foreign visitors this was an interesting opportunity of observing the condition and progress of Italian taste and ingenuity. But the Italians themselves made the occasion an inauguration festival of their newly acquired national independence. There was a spirit of freedom abroad in those days, which stirred to its depths the tide of popular sentiment. On the days of free admission, when the building was thronged with the people, crowds were always gathered round the statue of a young girl, reading from an open book. There was little, at first sight, to attract the gaze of the vulgar. The features of the girl, though intelligent, were plain, and her book was supported on the back of a common rush-bottomed chair. In countries less educated in art the eyes of the crowd would have turned to more showy sculptures. But in Italy the beauty of art, when truest to nature, is more widely appreciated. A stranger seeing the crowds round this statue might

conclude that much of the interest was due to the figure. But on drawing near he would find that a deeper feeling was at work. On the page before her was a passage printed, which had indeed a magic for Italians, and for Florentines most of all. It is an extract from Niccolini's tragedy, "Arnaldo da Brescia," which was not allowed to be printed, much less acted in Tuscany, in the days of the grand dukes. It turns on the reforming efforts and the death of Arnold of Brescia, who, as early as the first half of the twelfth century, aspired to make of a free Rome the centre of a united Italy. The passage is where Arnold, when given up by the Emperor Barbarossa to his cruel enemy Pope Adrian, mounts the pile of martyrdom at the gate of the Castle of St. Angelo.

"God makes a prophet of me; in accord
I see the Lombard people plight their faith,
From twenty cities flung abroad to heaven,
Rises in blood and ashes one sole flag.
The Company of Death* falls to the ground
Beseeching the Eternal: flies to heaven
From those unflinching lips the oath that strikes
The tyrant pale, scatters his hirelings round him,
And plucks his banner down by hands of pith.
That proud one stands aghast; and to the ground,
Once pathway for his triumphs, flings himself,
Borne down by the first onset, till he hide
His shame amid the slaughter of his friends.
I see the Germans flee across the Alps,
Their greedy eagle dragged in the mire,
Their crown made a redeemed people's mock."

The sculptor, Pietro Magni, was one who entered fully into the patriotic as well as artistic sympathies of his nation. Twice he had laid down his mallet for a musket, and had served two campaigns under Garibaldi, as one of the *Cacciatori dei Alpi*. He is now Professor in the Academy of Milan. From the style of San Giorgio, his master, and older classical styles, Magni has widely departed. Professing to follow life actual, not ideal, he is one of the most conspicuous of the school of "naturalists." In the "Reading Girl" he has made allowable use of naturalism, retaining sufficient homeliness to command the sympathy of the multitude, at the same time without any sacrifice of what is due to the highest taste and art.

The statue was exhibited at the International Exhibition in Hyde Park in 1882. It was purchased by the London Stereoscopic Company, whose photographs have made it familiar in many English homes.

THE ALBERT MEMORIAL IN HYDE PARK.

On the abandonment of the intention to raise a vast monolithic obelisk on the site of the Exhibition of 1851, several of the most eminent architects were invited to submit designs for a national monument to the memory of H.R.H. the Prince Consort, and that of Mr. G. Gilbert Scott, R.A., was selected.

Mr. Scott's design, though in some sense a "memorial cross," differs widely in type from the form usually described by that term. It is, in fact, a vast canopy or shrine, overshadowing a colossal statue of the personage to be commemorated, and itself enriched throughout with artistic illustrations of or allusions to the arts and sciences fostered by the Prince, and the virtues which adorned his character.

The canopy or shrine which forms the main feature of the memorial is raised upon a platform, approached on all sides by a vast double flight of steps, and stands upon a basement or podium rising from this elevated platform,

to a level of about twelve feet from the ground. Upon the angles of this podium stand the four great clusters of granite shafts, twenty feet high, that support the canopy, which is itself arched on each side from these massive pillars, each face being terminated by a gable, and each angle by a lofty pinnacle, while over all rises a *flèche* or enriched spire of metal-work, surmounted by a gemmed and floriated cross.

Beneath the canopy, and raised upon a pedestal, will be placed the *quasi*-enthroned statue of the Prince Consort.

The idea of the architect in his design of the canopy, as stated in the printed paper which accompanied his first drawings, was this:—The first conception was a shrine. The exquisite metal and jewelled shrines of the twelfth and thirteenth centuries are nearly always ideal models of larger structures, but of structures of which the original type never existed. Their pillars were of gold or silver gilt, enriched with wreaths of exquisite pattern-work in many-coloured enamel. Their arches, gables, and other architectural features were either chased in beautiful foliage cut in gold or silver, or enriched with alternate *plaques* of enamel pattern work, and of filigree studded with gems. Their roofs were covered with patterns of *repoussé* work or enamel, and enriched with sculptured medallions; the crestings of roofs and gables were griled with exquisite open foliage in gold or silver, while every part was replete with sculpture, enamel paintings, and jewellery."

The architect's aim was to reproduce in some degree at full size the ideal structure which these wonderful old jewellers represented in model. This idea could not, of course, be literally carried out, but it has determined the leading characteristics of the monument, and, at least so far as the metal-work is concerned, is being faithfully acted on, while in the more massive parts of the structure it cannot be carried further than to give its tone to the decorations.

The four pillars which support the canopy consist each of eight shafts of polished granite, grouping round a central "core." Four of these are of the beautiful red granite from the Ross of Mull, and are each two feet in diameter at the foot, but slightly tapering upwards. The other four are of a fine, dark gray granite from the Castle Wellan quarries, in the north of Ireland. These are somewhat less than a foot in diameter. The bases are in two heights, the lower one being of the Ross of Mull granite, and the upper being another variety from Castle Wellan, of a colour almost approaching to black marble. The latter are in single stones, each of which, when unwrought, weighed about seventeen tons. The working of each employed eight men for about twenty weeks, and is probably one of the most highly-finished and costly pieces of work executed in granite in modern times, every moulding being wrought with the utmost precision, and brought to the finest polish. The base and capping mouldings of the podium are of two varieties of the Ross of Mull granite, also highly polished.

The structural parts of the canopy, such as its arches, etc., are of Portland stone; and the capitals, thirteen tons weight, of the great pillars are carved out of vast blocks from the quarries of Mr. Whitworth, at Darley Dale, in Derbyshire.

The stonework will be richly carved, and the carved surfaces gilt and enriched by studs of coloured enamel and polished stones, as will the surfaces of the pinnacles, the cornices, etc., polished granite again from time to time appearing in conjunction with the stonework.

The pedestal which will support the statue of the

* A body of warriors who had bound themselves under this name to gain freedom for their country or die.

Prince is polished granite and marble. In this part alone appears the exquisite pink granite from Correnac, a mountain some thirty miles from Aberdeen, where, in the absence of any quarry, the most beautiful of all British granites is found in the boulders which are strewn upon the mountain side. The dado of the pedestal, which is of marble, will be richly carved, gilt, and gemmed, and will in front display the armorial bearings of the Prince.

The surrounding flights of steps, with the large pedestals which will support the groups of sculpture at the outer angles, are of finely wrought but unpolished granite.

The central statue is being executed by the Baron Marochetti, R.A.—a sitting figure, about 13ft. 6in. high, in bronze, gilt, and in parts enamelled.

The groups of sculpture at the outer angles of the steps are intended to have reference to the International Exhibitions and their contributors from all parts of the world, symbolical figures of the four quarters of the globe being introduced, seated on characteristic animals—as the bull, the elephant, the camel, and the bison—and surrounded by representative figures of different countries. These are being executed by Mr. McDowell, R.A., Mr. Foley, R.A., Mr. Theed, and Mr. Bell. Each group will be about 11ft. high and 13ft. 4in. square at its base.

On projecting counterforts at the angles of the podium will be found other groups, representing allegorically Agriculture, Engineering, Commerce, and Manufacture. These will be by Mr. Weekes, R.A., Mr. Calder Marshall, R.A., Mr. Thorneycroft, and Mr. Lawlor. The dado of the podium itself will present a continuous range of sculpture in alto-relievo, containing, in the manner of the *Hémicycle des Beaux Arts*, by Delaroche, grouped statues, life-size, of the principal professors of Poetry (with Music), Painting, Sculpture, and Architecture, the two former by Mr. H. H. Armstead, the two latter by Mr. J. B. Philip. The models of all these figures are far advanced. The actual sculpture is in hand, and (as is the case with all which has yet been mentioned) is executed in what is known as the Carrara quarries, where it is procured, as “Campanella,” from its ringing like a bell. This marble, though harder than any usually imported into this country, has been selected to insure durability.

On the angles of the monument will be eight statues in bronze, parcel gilt, representing the sciences of Astronomy, Geometry, Geology, Chemistry, Rhetoric, Philosophy, Physiology, and Medicine, by Mr. H. H. Armstead and Mr. J. B. Philip.

In the tympana of the gables and in the spandrels of the arches will be mosaic pictures relating to the arts whose professors are represented below, those in the gables being allegorical figures representing the Arts, and the spandrels illustrating their practical operations. These will be executed in mosaic by Signor Salviati from cartoons by Mr. J. R. Clayton. The vaulting of the canopy will also be enriched with mosaic. The architectural carving is by Messrs. Farmer and Brindley.

The ornamental metal-work, comprising the flèche (rising to 175 feet from the ground), the roofs and gables, and the bands round the great pillars, are executed by Mr. Skedmore, of Coventry. The flèche consists of an internal framework of iron clothed with a highly-enriched exterior of lead and copper, and adorned with gold enamel, inlayings, and polished stones.

In the ornamentation of the metal-work will appear the armorial badges, mottoes, etc., of the Prince, and in niches in the flèche will be figures representing the

moral and Christian virtues, the whole surmounted by a large and highly-enriched cross.

The dedicatory inscription will surround the structure immediately below the main cornice.

Much praise is due to Mr. Kelk, M.P., who undertook the contract for the erection of so noble a piece of work as this Memorial, and executed it for the committee without any remuneration to himself. It is a great pleasure to find that the work gives general satisfaction, the whole being executed with much care and judgment. All the materials are of the best quality, and the mechanics employed are first-class men, under the watchful superintendence of Mr. W. Cross, director of the works.

It may be mentioned that the site on which the Memorial is being erected is, as nearly as may be, at the intersecting point of the central lines of the two great International Exhibitions originated by the Prince Consort.

NEW YEAR'S EVE.

NAY, no dreaming to-night. You and I will wake and watch:
With the shutters opened wide and the door upon the latch,
Patiently sit by the fire with open eye and ear,
Waking and watching to-night of all nights in the changing year.

The marshes stiffened in ice, long ere the sun went down;
And the ragged bulrush and reed wore a glorified golden crown,
As the crimson rays shot forth from the far-off western glow,
Tinting the dreary pools and the patches of frozen snow.

Slowly the great sun sank, and the heavens grew black with cold;
From the snowy hill leapt down, like a famine-pinched wolf on the fold,
The hungry howling blast, and its teeth were sharp for blood,
As it scoured the open plain and ravened along the wood.

Then rings the curfew bell from the church tower far away,
And the sailor counts the strokes from his vessel moored out in the bay;
Pausing upon the deck in his slippery walk up and down,
With a wistful glance at the lights of the quiet slumbering town.

Oh, long is the winter night! But before to-morrow's dawn
We shall see the Old Year die—we shall see the New Year born:
So goes this wondrous world, with its moments, and months, and years,
So goes this life of ours, with its manifold hopes and fears!

Alas, for the idle hand and the idle blood in the vein!
Is there nothing to shock the heart—is there nothing to strike the brain,
And stir them to action and life, ere the sum of the years be past,
And the total of all be dreams and folly from first to last?

* * * * *

Was that a sigh in the room? Did you hear a long-drawn sigh?
See, it is midnight now, and the year is about to die.
Let us stand with awe in our hearts. Lo, the New Year fronts the Old,
And the young lips gently kiss the lips that are fixed and cold.

* * * * *

The heavens are rich with light. Where, where is the bright New Star?
Oh for the dominant faith that the soul might look out afar,
And hear as the shepherds heard on the plains of Bethlehem;
And see as the Magi saw!—it will lead us as it led them.

Now for the New Year's work. Thank God for his loving care.
Merciful Master of Life, to Thee do we make our prayer:
Help us to labour in hope till the corn and the grapes appear,
And we enter to rest with Thee in the joy of the Endless Year.

ALFRED NORRIS.

Varieties.

VICTORIAN EMIGRATION.—Persons anxious to reconcile contradictory statements about the condition of our colonial possessions, and especially Australia, will do well to remember that that continent is made up of what, in our northern hemisphere, we should call many nations; and that, as we never speak generally of the condition of the labour market of Europe, but particularly of the depression or healthiness in each country, never confounding the boors of Russia with the artisans of England, so it is wise to particularise with regard to Australia, and to know that simultaneously there may be paralysis and stagnation in Queensland, floods and depression in New South Wales, competency and quiet comfort in South Australia, with abundance and a high state of prosperity in Victoria. If we will remember this fact, and not forget that mercantile failures, misfortunes, and misdoings here are reflected there as faithfully as a face in a glass, we shall not be very surprised that just now Australian shadows are not so pleasing or so pretty as they have been, and as I venture to predict they will be again before long.—*Maria S. Rye.*

THE DIVORCE COURT.—In 1866, 215 petitions were filed in the Divorce Court for a dissolution of marriage, 8 for a declaration of nullity of marriage, 64 for a judicial separation, and 17 for restitution to conjugal rights. 183 judgments were given. Since the Court was established, nine years ago, 2,751 petitions have been filed and 1,650 judgments given upon those applications. The public would like to learn the nature of the judgments, so that it might be known how many marriages are dissolved in a year; but this is what the registrar who makes this annual return always omits to state.

THE AMENITIES OF AUTHORSHIP.—M. Alexandre Dumas, desiring to give to one of his novels—"Les Blancs et les Bleus,"—a tone of historical accuracy in the details, applied to one of the public libraries of Paris to have communicated to him all the documents connected with the 13th *Vendémiaire*. His application was refused, on which he addressed the subjoined letter to the Emperor Napoleon III.:—"Illustrious *Confrère*,—When you undertook to write the life of the Conqueror of the Gauls, all the libraries were eager to place at your disposal the documents which they contain. The result is a work superior to others, in the circumstance that it brings together the greatest number of historical documents. Engaged at the present moment in writing the life of another Cæsar, named 'Napoleon Bonaparte,' I require documents relating to his appearance on the scene of this world. In brief, I should like to have all the pamphlets which the 13th *Vendémiaire* brought forth. I have asked for them at the library; they have been refused. There remains to me no other means than to apply to you, my illustrious *confrère*, to whom nothing is refused, to beg you to ask for these works in your own name, at the library, and to be good enough, when you shall have received them, to place them at my disposal. If you will be so kind as to grant this request you will have rendered me a service which, in a literary sense, I shall never forget. I have the honour to be, with respect, illustrious author of the 'Life of Cæsar,' your very humble and most grateful *confrère*, Alexandre Dumas." The next day the writer received through M. Duruy the pamphlets asked for.

DR. VALPY'S VERSE.—The late Dr. Marsh, when on a visit at Tollymore Park, in the summer of 1837, told Lord Roden that a remarkable change took place in the views of his old schoolmaster, the well-known Dr. Valpy, of Reading, in his latter days, repeating a verse he had written as his confession of faith, not long before his death. Lord Roden requested Dr. Marsh to write out the lines for him, and then fastened the paper over the mantel-piece in his study, where it hangs still, now yellow with age. Some time after Lord Roden had adopted this verse for the motto of his study, one of the old heroes of Waterloo, General Taylor, came to visit him at Tollymore. He had not at that time thought much on the subject of religion, and preferred to avoid all discussion on it. But whenever he came into the study to talk with his friend alone, Lord Roden remarked that the eyes of the old soldier invariably rested for a few moments upon the motto over the mantel-piece. At length he broke the ice by saying, "Why, General, you will soon know that verse by heart." "I know it now by heart," replied the General, with emphasis and feeling. From the time of that visit a change came over his spirit and life.

No one who was intimately acquainted with him could doubt its reality. During the following two years he corresponded regularly with Lord Roden about the things which concerned his peace, always concluding his letters by quoting the favourite motto. At the end of that time, the physician who had attended General Taylor wrote to Lord Roden to say that his friend had departed in peace, and that the last words which fell from his dying lips were those which he had learnt to love in his lifetime:—

"In peace let me resign my breath,
And Thy salvation see;
My sins deserve eternal death,
But Jesus died for me."

It happened in after years that Lord Roden told this story at the house of a near neighbour. A young relative of the family, an officer of the army, who had recently returned from the Crimea, heard it, but turned carelessly away. Some months later Lord Roden received the intelligence that his young acquaintance was in a rapid decline, and was desirous of seeing him without delay. As he entered the sick-room, the dying man stretched out both hands to welcome him, at the same time repeating those simple lines. "They have been God's message," he said, "of peace and comfort to my heart in this illness, when brought to my memory, after days of darkness and distress, by the Holy Ghost, the Comforter."—*Life of Dr. Marsh.*

CANADIAN SEASONS.—The winter in Canada, though severe, is enjoyable and healthful. Instead of that miserable alternation of rain and fog, snow and sleet, that converts our metropolitan streets into rivers of mud, and our country roads into impassable quagmires, Canada can boast of clear skies, a beautifully clear dry atmosphere, and the entire country "macadamized with crystal." A Canadian winter is precisely like a winter at St. Petersburg, while the summer approximates to that of Paris. The approach of summer is announced by the movements of the animal world. The song-sparrow commences his plaintive ditties in March, and the Canadian robin sings cheerily whilst the snow lies thickly upon the ground. Wild fowl begin to wing their way northward about the middle of April, and the bull-frog is first heard grunting out his importance on St. George's day. The transition from winter to summer in the far west is so sudden that one hardly believes that half a year of icy cold has held everything in bondage. The thick mantle of snow so shields and protects the vegetation, that beneath it the early flowers open their blossoms, the grass springs up fresh and green, and the buds burst into leafage. Then birds and insects make their appearance so mysteriously that when the sun melts the ice and thaws the snow from off the land, everything changes into refulgent summer, as if touched by the wand of an enchanter. To compensate for the want of spring the autumn is prolonged and beautifully mild, and lingers on with its Indian summer, and the golden glory of its sunsets, as late as December. This extraordinary interregnum of delightful weather, styled the Indian summer, is variable in duration and of somewhat uncertain recurrence. The French habitants call it "L'été St. Martin."—J. K. LORD, R.Z.S.

SENSATIONAL LITERATURE AND ART.—The rage for the sensational now thoroughly taints both literature and art, and, strange to say, it is always a fact that when a nation imbibes this love for the fantastic and sensational, it always also imbibes wild wolfish ideas of death. At one of the operas in London lately he had seen a scene with ballet dancers capering in the foreground, and a row of corpses holding the candles behind them. A noble nation is not one which would be pleased by any but beautiful and holy representations of death, yet an English high-caste audience could sit and view a scene like that. The taste penetrates to the very roots of society. During a recent visit of charity children to Hampstead Heath, with its grand old trees, its wide stretch of scenery, its clouds and blue sky above, and its humble wild flowers below, what were these children found talking about? About some dead bodies recently dragged out of the Paddington Canal, coupled with impure speculations as to what had been the previous lives of the victims. The compassionate phase of modern art implies sorrow for the squalor and misery of the poor on every side, which the rich have the power to remove if they like; but whilst such scenes exist there must be something radically wrong in the nation itself.—*Mr. Ruskin's Lecture at the Royal Institution.*

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper*.

SAVED FROM THE WRECK.

THE MORTONS OF MORTON HALL.

CHAPTER II.—MARY AND HENRY TALBOT LEAVE ROSE COTTAGE FOR LONDON.

ABOUT a fortnight after the funeral of Mrs. Talbot, the orphan brother and sister were seated alone in the little parlour at Rose Cottage. It was the last day they were to spend together in the home of their childhood.

The cottage had been relet by the landlord, and the furniture—with the exception of a few articles retained as tokens of remembrance—had been sold at a valuation, for the benefit of the orphans, to the new tenants, who were to take possession on the following day.

When it was stated in the preceding chapter that Mary and Henry Talbot were left, apparently, without a friend in the world able and willing to serve them, reference was made to friends upon whom they had a claim, and whose duty it was to render them assistance in their hour of trial. These friends failed them in their need; but it is rarely the case that young people in their position find themselves utterly friendless, unless they have forfeited, by their own misconduct, all claim to the friendship of others. Henry Talbot had been already offered, and had temporarily accepted, a situation in the office of a lawyer with whom his father had had

business dealings; and Mary had been offered, and had also temporarily accepted, the shelter of a home at the residence of an old lady who had once occupied the position of housekeeper to the parents of Mrs. Talbot, and who now lived in the outskirts of London.

The sale of the furniture of Rose Cottage had, after the servants' wages, and a few trifling outstanding debts due to the village shopkeepers, had been paid, left the young people in possession of a hundred and fifty pounds with which to begin the world on their own account; and they were now quietly talking about their future prospects, prior to their separation and departure to their new homes.

"It was very kind in Mr. Dawson to offer me employment," said Henry, after a brief pause in the conversation. "But I shan't stay long with him. As soon as *you* are comfortably settled I shall go to India, or America, or somewhere. I shan't remain a poor beggar in England."

"To India or America, Henry dear?" exclaimed Mary. "You would leave me alone in England?" she added, sorrowfully.

"Only for a short time, Mary," replied the boy, confidently. "That is, if you like to rejoin me in India or America, or wherever I may go. Otherwise, you know, I shall send you money to England. You see, you'll have only me to look to now, and I'm sure I shall do better abroad than here, without friends to help me, or money to help myself."

"Henry dear, you are not speaking seriously?"

"Ain't I, though? Indeed, Mary, I am."

"Why not remain with Mr. Dawson?"

"To starve through life—a mere lawyer's clerk!"

"Only till you were a lawyer yourself."

"That shows how much women know about such things," said Henry, rudely interrupting his sister. "To become a lawyer, I must be an articled clerk in the first place; I know enough to know that; and that would cost I don't know how much money. Then, if I had the means to become an articled clerk, I wouldn't become one. I hate the law; I should never stick to it, I know. I wish papa had let me enter the navy."

"You know how long poor papa served in the navy without promotion, Henry?" said Mary.

"He was a lieutenant. He might have been a captain, perhaps, if he had continued in the service. At all events, I could do as he did: I could enter the merchant service—"

"And perhaps be lost at sea, like poor dear papa," interrupted Mary, her voice trembling as she spoke. "I should then be left alone in the world. You know, dear Henry, how anxious poor mamma always was when papa was away, and how she objected to *your* going to sea when you first expressed a wish to enter the navy. Henry, I should be so unhappy if you were to go to sea now!"

"Well, Mary," answered the boy, "I wouldn't go to sea as a sailor if I thought it would vex you; but you may make yourself easy, I am too old now. I was in hope that papa would have bought me a commission in the army. He would if he had lived. He almost promised last time he was at home. But I have made up my mind to go abroad to one of the colonies. There, at least, I shall have a fairer field open to me, and I feel confident of success; but I shall not go just yet. I shall see you comfortably settled first. You say nothing about yourself? It's very good of old Margaret to offer you a home, and I dare say the old lady is pretty well off now; but you won't think of remaining with her?"

"No, dear, certainly not; I wouldn't remain to be a

burden upon poor good old Margaret on any consideration. But have no fears for me, Henry: I can teach music and drawing; you know how my drawings have been praised. I may be able to work for the picture-dealers; and, at all events, if I fail to obtain such employment as I fancy will best suit me, I can at least get a situation as a nursery governess."

"A precious situation for a young lady like you! However," he continued, with a boyish assumption of masculine superiority, "I suppose a woman can't do anything better. That's why I mean to go abroad, Mary. In a year or two I shall be a man, and then you must come and live with me, and take care of my house till I am married; and then you needn't go away unless you get married yourself, which won't be likely, because, of course, you'll marry no one but a gentleman, and a gentleman isn't likely to marry you without some fortune, which I may be able to give you perhaps in course of time. But we won't look forward to that just now."

Mary Talbot could not help smiling to herself, though sadly, at her young brother's sanguine anticipations and promises of patronage. She had much less faith than he in the certainty of his meeting with success in whatever occupation he might choose to engage; but she said nothing to discourage him, and she hoped his idea of going abroad was merely a boyish fancy which he would not long retain.

They walked abroad and visited together, probably for the last time, all the favourite haunts of their happy childhood; and together visited and wept over the newly-made grave of their mother, and thought sadly, as young hearts *do* sometimes think, of the fond and dearly-loved father whose unknown grave in the ocean depths they could never visit. Then they bade a kind farewell to several poor and aged cottagers who had long been pensioners of their deceased mother, and who would suffer sadly through the loss of their kind benefactress; and then they returned to the cottage, and sat up late into the night talking over the past and building bright hopes for the future, until at length they retired to rest for the last time in the only home they had ever known—the home soon no longer to be theirs, but which, so long as they lived, would be fondly enshrined in their memory.

Early the next morning they set out for London, and were met on their arrival in the evening, at the coach-office in Oxford-street, by the *ci-devant* housekeeper, who received them kindly, and took them to her pretty cottage in Hammersmith, which she begged them to look upon as their home so long as they chose to make her happy by remaining with her.

Henry, however, went in a few days to the lawyer's office in Lincoln's Inn Fields; and Mary, though she gratefully accepted the kind old lady's offer of a home, determined immediately to seek for some employment, by means of which she would render herself independent of what she felt was, after all, but the charity of one upon whose generosity she had no actual claim.

Through the recommendation of the old housekeeper, she was soon engaged to give lessons in music and drawing to the daughters of three or four of the better class of shopkeepers; and, though her earnings were but small, they were at least sufficient to enable her to support herself, with economy, without entrenching upon the little capital which she and her brother had equally shared between them.

Distasteful as was Henry's employment in the lawyer's office, he laboured at it assiduously, as he had promised his sister, and gave satisfaction to his employer; but, in spite of Mary's endeavours to persuade him to remain

with the kind-hearted lawyer, he firmly adhered to his original resolution to seek his fortune abroad as soon as he saw his sister comfortably settled. He had at length determined to choose America, because it was nearer England, and he and his sister could thus correspond with each other more readily.

Mary, perceiving that no arguments that she could use could alter her brother's resolve, strove to reconcile herself, as best she could, to the idea of their separation.

CHAPTER III.—ANOTHER SHIPWRECK.

On the afternoon of the same day on which the Andromache East Indianan drove on shore near the Lizard light-house, a party of sailors and fishermen were standing on the summit of the cliffs, between St. Mawes and Deadman's Point, on the south coast of Cornwall, watching with intense interest the effects of the storm upon the waters of the Channel, far beneath their feet. The gale was beginning to subside, although the wind still blew with great violence; and, though the rain had ceased, the sky still wore a dull, leaden hue, and the atmosphere was "dank" and misty with the spray blown up from the angry waters.

"Aw think, Bill, 't ha' well-nigh blown itsen out," observed one of the group to his next neighbour. "What says thou, määte?"

"Aw think zo, mysen, Jemmy," was the reply; "but theer'll be wracks enough 'long t' coast. Aw ne'er see a harder gale, sin' aw weer a lad, as aw can mind."

"'Tweer a marcy, Bill," replied the first speaker, who wore a wooden leg, and was several years older than his companions, who appeared to look up to him with a sort of rude reverence—" 'twear a marcy as a' th' boats weer in, when t' gale coom on. Theer'd ha' been sad wark i' th' village if a' th' fisher-lads had been out to sea i' sich a storm as thisn. Aw mind oncest, when aw weer a lad, avore aw went to sea, mysen, when more'n a hunder men an' lads, as weer out i' th' herrin'-season, weer lost i' one night. Ah, määtes, aw shall ne'er forget yon time if aw weer to live to be a hunder—. Do 'ee see nought yonder away under t' headland, shipmates?" cried the speaker, suddenly breaking off from his remarks.

At this question the eyes of the whole party were directed towards the headland, at which the ancient wooden-legged mariner pointed his finger; and, dimly perceptible through the mist, and the gathering shades of evening—like the shadow of a rising object in a dissolving view—appeared the faint outlines of a vessel's hull and sails, so close under the land that the shadows of ship and land appeared to mingle.

There was a few moments' silence, only broken by the howling of the wind, and the angry roar of the waters beneath the cliff, and then, as the outlines grew more and more distinct, came a simultaneous cry from the assembled seamen—

"'Tis a vessel bearin' down right into the bay! Heaven help 'em, they ha'n't seen the land. Nought can save 'em now. They'll be on t' reef in less'n five minits!"

Evidently those on board had not seen the land, nor had any idea they were so near it, until the mist lifted, and they found themselves close under it. Nothing now could be done by themselves or by others to save the ship. They had rushed blindly to their doom, and they knew that in a few minutes they must meet it. They could see the reef almost within hail of the vessel's prow; the sea boiling and seething in white hissing foam around the black pointed rocks. On either side, the rugged cliffs rose high above the mastheads; and

astern, the sea, whirling furiously round the headlands, opposed, as it were, a wall of stormy water to bar them in and prevent their egress.

If now they could save their lives, they could do no more. This the seamen on the cliff saw at a glance, and waiting for nothing more they hastened back to the village to give the alarm.

By the time they reached the base of the cliff, however, they found that the people of the village were already on the alert. The ship, as they had anticipated, had struck bodily upon the reef, and almost immediately gone to pieces. Nay, they fancied they had heard the crash, and the wild shriek for help that accompanied it, amid the howling of the tempest. Already the waters of the bay were strewn with broken spars and timbers, to which the forms of the helpless crew were seen clinging, and already the beach was thronged with men, women, and even children of both sexes, all willing with all their strength to drag the boats down to the water's edge, and launch them on their life-saving errand. There was no lack of volunteers to man the boats; the chief evil was that too many pushed themselves forward, eager to take part in the perilous duty, and there was some fear that the boats might be swamped. Even the women encouraged their husbands, sons, and brothers to go forth to the rescue; for the sight before them was one to call forth all the keenest sympathies of a maritime population, and he who hung back on such an occasion would thenceforward have been pointed at as a coward, and regarded with general scorn and contempt by his neighbours.

It was essential, however, that order should be maintained, and that only a certain number should man each boat; and quarrels might have arisen that might have rendered all this generous ardour on the part of the fishermen of no avail, but for the timely arrival of the ancient wooden-legged mariner. As soon, however, as he was seen approaching, the direction was given to him, with one accord.

"Here cooms Jemmy Tapley," was the cry. "Leave a' to him, lads. He'll say who's to go and who's to stay," and, without a word, as if it were a matter of course, the old seaman took the direction in his own hands, and all submitted to his decrees without a murmur. Some were ordered into the boats; others were appointed to launch the laden boats into the water, and to stand by to drag them to the beach on their return. Others, again, were directed to be in readiness to bear the rescued, half-drowned crew to the village, near by, and the women were sent home to prepare the cottages to receive the shipwrecked men.

Fortunately the water within the reef upon which the wreck lay, distant about half a mile from the shore, was comparatively smooth; and so well was everything arranged, and so promptly were the old sailor's orders obeyed, that—although one or two boats were swamped in the surf, while their crews narrowly escaped from drowning, or being crushed among the rocks—the whole of the crew, together with the one solitary passenger on board the wrecked vessel, were saved through the gallant exertions of the fishermen, and temporarily sheltered in the cottages of the adjacent village of St. Davids—and this without the occurrence of any serious accident. It was found that not one of the shipwrecked crew had suffered any serious bodily injury, though several suffered from bruises received by being dashed against the rocks.

The passenger, however, was more seriously injured. He had been struck by some of the falling spars, or broken timbers, and was brought on shore in a state of

insensibility. He was carried to the "Fisherman's Arms," the only public-house in the village, where he was stripped of his wet clothing and put to bed, and left to the care of the landlady.

So furiously still raged the storm that it was impossible that night to obtain the services of Doctor Pendriggen, who resided only a mile or two from St. Davids, and who was the only medical man within a circuit of fifteen miles around the village. Darkness had set in long before the whole of the crew were rescued from the wreck, and the prolonged storm had caused the road between the village and the doctor's house to be so deeply flooded, that it was dangerous to attempt to pass over it after nightfall.

During the night, however, the gale greatly subsided, and, though the wind was still high, the doctor made his appearance early the next morning, accompanied on his errand of mercy by the rector and the curate of the parish, the three gentlemen having set out to visit the village the moment they heard that a vessel had been wrecked in the bay on the previous night.

When these three gentlemen reached the beach, they saw that the shore was lined by a crowd of fishermen, women, and children, who, heedless of the fierce, cold wind, were watching for such portions of the wrecked ship's cargo as were drifted within their reach. They stood in groups along the shore, and, when anything valuable drifted near them, they joined hand in hand, and, rushing into the sea breast high, seized upon the spoil, and hauled it to the beach, where it was handed over to the women and children, who dragged or bore it away to some secret hiding-place, or to their own cottages.

Directly beneath the overhanging cliffs, a considerable distance from the shore, the aged, wooden-legged mariner, who had done such good service on the previous night, stood aloof from the busy, eager crowd, watching their proceedings; but whether in dissatisfaction at the work in which they were engaged, or in regret that his own physical disability prevented him from appropriating to himself a due share of the spoil, it was impossible to tell.

"So, Tapley," said the rector, as the three gentlemen drew near the old man, who was so much occupied with the scene before him that he had not perceived their approach, "I see the people are at their old work again. I thought better of some whom I see among them."

The wooden-legged mariner touched his hat respectfully. "Ay, your reverence," he replied; "what's bred i' th' boane arn't easy rooted out o' the flesh. They'll hearken to 'ee, and make vine promises; but, as soon as a wrack cooms ashore—they'll try to save the crew, aw'll say that vor 'em—but they'll claim salvage o' t' cāargo, spite o' all the teachin' an' preachin' i' the world. But then, your reverence, 'em bean't ersac'ly sailors—only fishermen, like."

"And if Jemmy Tapley had the use of both his lower limbs," whispered the doctor in the rector's ear, "he'd be foremost among them."

"Nay, nay, doctor," replied the rector; "there does not breathe a more honest, trustworthy fellow than Jemmy Tapley."

"Ay, there I agree with you; I'd trust him with untold gold: but if a punt, with only a few barrels of herrings on board, were to be cast ashore, I'd venture any odds that, if Tapley had the chance, he'd risk life and limb to secure his share of the spoil."

"I wish my niece heard you, doctor," said the rector, with a smile.

"Nay, I dare not enter the lists against Miss War-dour, in disfavour of her champion knight. I'm aware that she regards Jemmy Tapley as the pride and mirror of ocean chivalry!"

The doctor now turned to Tapley, and said, "I only heard of the wreck this morning; but I understand that the crew were all saved?"

"Ay, sir; but 'tweer a narrow chance. The wrack went to pieces in less'n five minits arter her struck. 'Tweer an awful night, and t' sea made a clean breach over her. Aw thowt, for sure, soom on 'em 'ad ha' lost t' noomber o' their mess; but they reckoned oop a' right."

"The vessel was from America, I hear?"

"Ay, sir; one o' th' New York liners. 'Pears as how 'em lost their reck'nin' i' th' murky weather, and weer runnin' oop Channel 'ithout a pilot on board. So I heern 'em say."

"It was heaven's mercy that no lives were lost," interposed the rector. "Were there any passengers on board?"

"On'y won, your reverence. He weer a bit bruised, an' we tuk un oop to Widdy Bolitho's 'public,' seein' as her could make un more coomfor'ble nor the volk i' th' village. Aw heerd un weer a' right this mornin'."

"Is he a young man?"

"No, sir; an elder sort o' gemman. He weer 'most gone when he weer brought ashore; but 'a soon coom round."

"We'll look in at Dame Bolitho's as we enter the village," said the rector to his companions; and, leaving Jemmy Tapley to his own reflections, the three gentlemen pursued their way towards the village.

The Widow Bolitho's "public," which stood near the entrance of the one long village street, was only distinguishable from the other cottages in being somewhat larger, and by having red curtains to the windows, while a rudely-painted sign, representing a party of fishermen just returned from a successful cruise, and in a condition of glorious conviviality, was suspended by a crane over the doorway.

The widow was a neat, plump little woman of some fifty years, whose husband had been master of a fishing-smack, and had perished at sea during a heavy gale of wind, about six years previous to the date of this history.

She had set up in business with her husband's savings, and prided herself upon the orderly and cleanly condition of her house; and as, in addition to the "public," she kept a small general shop—the only one in the village—she did a tolerably thriving trade.

Doctor Pendriggen raised the latch of the door, and entered the "public," followed by his companions. They somewhat surprised and, to use her own expression, "flustered" the good dame, who was profuse in her compliments when she perceived who her visitors really were.

"We have called, dame," said the doctor, "to inquire after the gentleman who was brought from the wreck to your house, last night."

"Well, doctor, he be coom round vinely," replied the widow, "though un be sore bruised, poor genelman. But un thowt more o' savin' a pocket-book he had wi' un, nor o' savin' his life, aw think. He took on terr'ble when he thowt it weer lost, and aw do think he'd ha' gone crazed if aw hadn't vound it vor un. 'Tweer in his inside coat pocket, an' 'tweer a mercy 'twern't lost when th' lads tuk off his wet clothes. But aw vound it for un, aw did. He do say as he be an Englishman, your reverence. He ha' coom back to vind his owd friends."

as he left years ago, an' 'tis a poor welcome he ha' had to the shore o' England, vor sure."

"Let us go up and see him," said the doctor; and they followed Dame Bolitho upstairs. As they ascended, they could hear the voice of the rescued passenger raised in bitter complaint to Maggie, the serving maid. He, however, heard the sound of footsteps on the stairs, and called out—"Is that you, dame? So you've found your way up at last? Come in, and look at the stuff you've sent me up for coffee."

Hoping to prevent any further deprecatory remarks, the widow quickly threw open the bedroom door and ushered in the three gentlemen, saying, "Here be t' reverend, sir, and t' doctor, and Mr. Sharpe is come to see 'ee——"

She stopped, terrified at the scowl of her guest, who was indignant at being thus suddenly intruded upon by strangers.

Perched up in bed, in a sitting posture, his back supported by pillows and his body and limbs enfolded in blankets, his head surmounted by a red woollen nightcap lent him by one of the fishermen, appeared the rescued passenger of the Powhattan, for that was the name of the wrecked American packet-ship.

His gray hair, matted with salt water and sand, straggled in elf-like locks from beneath the nightcap, and his cheeks and upper lip and chin were covered with gray stubble of a week's growth, while his face and forehead were plentifully bedecked with black strips of plaster, hastily put on the night before by the widow and her friends, from which smears of blood had escaped and clotted around them.

The floor and the furniture of the room, and the bedding and curtains, were all as clean as possible; nevertheless, the place wore the generally untidy appearance of a bedroom in the morning.

"Begone, woman! What do you mean by this?" shouted the stranger, as soon as his indignation would allow him to speak; and the dame bolted like a shot from the room, followed by her terrified handmaid, leaving the three gentlemen to explain the cause of their rude intrusion as best they could.

"And now, gentlemen, may I ask what brought you here?" inquired the stranger, with grim politeness—for he had the look and manner of a gentleman, spite of his present rueful guise—drawing himself up, and dragging the blankets closer round him as he spoke.

The rector instantly stepped forward and explained the object of the visit, and the manner in which he and his friends had involuntarily been, as it were, forced into the room; and the stranger, when he understood the actual circumstances, not only recovered his temper, but thanked his visitors for their kindly interest in his welfare. On examination, the doctor found that the bruises he had received were comparatively trifling, but he had so severely sprained his right ankle that he was likely to be detained a prisoner to his room for several weeks.

The stranger groaned, and cast a woful glance around the small confined apartment, and the rector, who understood the look, immediately invited him to the parsonage.

"My house is near," he said, "and there are abundance of spare rooms. You will be nearer the doctor, and will have every attention paid to you. There is no public accommodation in the village for an invalid."

The stranger protested that he could not think of intruding himself upon the rector's hospitality, but the latter insisted that, under the circumstances, he was but doing his duty in rendering a shipwrecked man all the assistance that lay in his power; and at length it was

arranged that the rector, on his return home, should acquaint his niece that she was to prepare to receive an invalid guest, and that a carriage should be sent to convey the stranger to the rectory, as soon as the latter was in a condition to be removed.

The doctor and his friends then visited the other cottages in which the shipwrecked crew had taken refuge, and saw that all were made as comfortable as possible under the circumstances. The captain of the wrecked ship had, with true Yankee promptitude, set out at daylight that morning to Falmouth to report the loss of his vessel, and confer with his consignees. None of the sailors had received any serious injury, and in a few days they were provided by the American consul at Falmouth with such absolute necessities as they required, and dispatched to London, to enter on board other ships belonging to the company.

The next day, the wrecked passenger, who stated that his name was Aston, was supplied, also from Falmouth, with such necessities, in the shape of clothing, etc., as he stood in need of, and in the evening was removed in the rector's carriage, under the doctor's charge, to the parsonage-house.

In a few days all that remained to show the disaster that had befallen the ill-fated ship Powhattan was a small portion of the vessel's keel still visible on the reef.

THINGS GONE OUT OF USE.

BY JOHN TIMBS.

I.

TIME, "the greatest innovator," in his progress works so many social changes that it becomes us every now and then to take stock of our comforts, in order to estimate how great have been our gains. All human improvement is the result of accumulations of time; and each successive age incorporates into itself the substance of the preceding. The late Prince Consort observed, in one of his manly addresses, that "whilst formerly discovery was wrapped in secrecy, the publicity of the present day causes that no sooner is a discovery or invention made than it is already improved upon and surpassed by competing efforts. To the human mind nothing is so fascinating as progress."

To begin at the beginning, we will glance at the early tool of education, the Horn-book, by which old persons now alive may have "learned their letters." We remember John Britton, born in the year 1771, used to tell of his learning from a schoolmistress in Wiltshire "the Christ-cross-row" from a hornbook, on which were the alphabet in large and small letters, and the nine figures in Roman and Arabic numerals. Hornbooks are now of great rarity; and an advertisement in a newspaper, many times repeated, offering a considerable sum for a specimen, has failed in producing an answer. One, of the time of Queen Elizabeth, has the leaf mounted on wood, and protected with transparent horn. Shensstone the poet, born in 1714, was taught to read at a dame-school, at which

"Their books, of stature small, they take in hand,
Which with pellucid horn secured are,
To save from fingers wet the letters fair."

Cowper describes the Horn-book of his time as

"Neatly secured from being soiled or torn,
Beneath a pane of thin translucent horn,
A book to please us at a tender age;
'Tis called a book, though but a single page."

We have seen a Horn-book that was met with in Lincolnshire in 1850. It measures 9 by 5 inches; the alphabet, etc., are printed upon white paper, which is laid

upon a thin piece of oak, and is covered with a sheet of horn, secured in its place by eight tacks driven through a border or mounting of brass. Generally there was a handle to the Horn-book, and this had usually a hole for a string, whereby it was strung to the girdle of the little scholar. How tedious must have been the teaching of children by such rude and clumsy means as this! Nor was the Horn-book always mounted on a board; many were printed on the horn only, or pasted to its back, like one used about sixty years since by a friend, when a boy at Bristol. The Horn-book was superseded by the Battledore and Reading Made Easy, with which came the alphabet illustrations, though the spelling-book is considerably older than either. We remember the gingerbread alphabet, which was common a century and a half ago:

"To Master John the English maid
A hornbook gives of gingerbread;
And, that the child may learn the better,
As he can name, he eats the letter."—*Prior*.

What are these humble aids to learning in comparison with the picture alphabets and well-printed first-books of the present day! not forgetting the frontispiece of a clock-face, with moveable hands, to enable a child to tell what o'clock it is—which, by the way, some young folks are very slow in learning.

The rude and primitive records by the use of notched sticks, or *tallies*, lasted from a very remote period to our time, and there is reason to believe that they were among the earliest means devised for keeping accounts. The tallies used in our Exchequer answered the purpose of receipts as well as implements of matters of account. They consisted of squared rods of hazel or other wood, upon one side of which was marked by notches the sum for which the tally was an acknowledgment; one kind of notch standing for £1,000, another for £100, another for £20, and others for 20s., 1s., etc. On two other sides of the tally, opposite to each other, the amount of the sum, the name of the payer, and the date of the transaction, were written by an officer called the Writer of the Tallies; and, after this was done, the stick was cleft longitudinally in such a manner that each piece retained one of the written sides, and one-half of every notch cut in the tally. One piece was then delivered to the person who had paid in the money, for which it was a receipt or acquittance, while the other was preserved in the Exchequer. Madox describes the use of these tallies as very ancient, coeval, for aught he knew, with the Exchequer itself in England. A multitude of accountants, book-keepers, and actuaries were born and died, still the Exchequer accounts continued to be kept on the tallies. In the reign of George III a change was proposed, but violently resisted, and it took until 1826 to get these sticks finally abolished. They were housed at Westminster; in October, 1834, two cartloads of the sticks were burnt in one day in furnaces or stoves connected with the heating flues which passed beneath the flooring of the House of Lords, and thus set fire to the wood-work, and, during the night, the Houses of Parliament were destroyed. Clumsy as the contrivance may appear, tallies were effectual in the prevention of forgery, since no ingenuity could produce a false tally which should perfectly correspond with the counter-tally preserved at the Exchequer; and no alteration of the sum expressed by the notches and the inscription could pass undetected when the two parts of the stick were fitted together; and forgeries were attempted immediately after the discontinuance of tally receipts.

Mr. Robert Chambers tells us that, until his early days, it was customary in Scotland for the baker's lad

to bring the *nick-sticks* with his bread, a notch being made for each loaf he left: while the notches on his stick corresponded with those on the one left with the family, both parties were satisfied that the account was justly kept by the *baker's tally*. In England, we had formerly the *washing tally*, a specimen of which was found at Haddon Hall, in Derbyshire, in 1863. It consists of a piece of beech-wood, covered with linen, precisely similar to a Horn-book, in front, the different articles being printed from copper-plate, and protected by a sheet of horn, fastened down by a strip of brass and ornamental nails. The tally is divided into fifteen squares, in each of which is a dial, numbered from 0 to 12, and above each square is the name of the article to be taken into account and "sent to the wash." On each of the dials is a circular brass indicator, fastened by a pin in its centre. Each indicator is pierced on one side, close to its outer edge, with a round hole, through which one number of the dial is visible; opposite to this opening is a raised point, by which the indicator may be turned to the figure representing the number of each article looked out for the "wash." Mr. Llewellyn Jewitt, F.S.A., has engraved and described a washing tally in his clever journal, the "*Reliquary*;" and a similar tally is in the possession of a gentleman of Liverpool. The washing tally has long given way to the washing-book, to be found in the shop of every stationer.

The most popular form of tally is that of the seller of milk—a flat piece of wood, on which the score is kept by lines of chalk. This mode of account has, we suspect, been almost superseded by the milk-sellers with an account. The last milk tally we remember to have seen in use was at the house of an aged maiden lady in Sloane Street, a few years since; and, near the same spot, we saw one of the last of the sedans conveying the same lady to her morning bath.

Books to take us from the track of our nursery mistakes have multiplied of late years. An observant walk through the Zoological Gardens will afford living lessons on the errors respecting animals. The Mermaid has long been thrown overboard; the tales of this book-wonder had their origin with manatees and dugongs, seals and walruses. The Death-watch is no longer believed to foretell death by its clicking, like the ticking of a watch, though this was a common belief for more than a century. The noise is now known to be the call of the insect in spring; the name of one species is referred to its lying *as though dead*, when touched. The Ear-wig is now known to be not more likely than other insects to enter the ear; and, if it does so, the drum-head of the ear will prevent the progress of the intruder, which may be killed or dislodged with ease by a few drops of oil. Its original name is thought to have been *Ear-wing*, from its wings being in shape like the human ear. The Aloe is no longer believed to attain maturity only at the end of one hundred years; for the period varies, according to circumstances, from ten to fifty, or even seventy years. In hot climates it grows rapidly; but in colder regions it requires the longest period that has been assigned to it. The legend which connects St. Swithin with *forty days of rain* has no semblance of foundation. From observations made at Greenwich Observatory for twenty years, the average proves rain to have fallen upon the largest number of days when St. Swithin's day was dry; and no event, or natural phenomenon which could be construed into such, is alluded to by any of the authors who wrote histories of St. Swithin.

The luck of Horse-shoes was in strong belief two centuries ago, when they were nailed on the thresholds

of doors, to hinder the power of witches that entered the house—the entrance being as probable as the prevention. When Monmouth Street was a fashionable locality of London, it was noted for its number of Horse-shoes nailed over the doorway, or on the sill. In 1813, Sir Henry Ellis counted here seventeen; in 1841 there were six; but in 1852 there were eleven; now there are fewer. Jews preponderate in this street. Nelson had great faith in the Horse-shoe, and one was nailed to the mast of the ship “Victory.” “Lucky Dr. James” attributed the success of his fever-powder to his finding a Horse-shoe, which he adopted as the crest upon his carriage. The sign of Meux’s brewery is a Horse-shoe. The “lucky belief” may have led to the Horse-shoe having been adopted as the ornamental portion of a scarf-pin.

The Gold-headed Cane, formerly carried by physicians, was long believed to contain some safeguard against infection. There is a collection of such canes in the College of Physicians. One of the last physicians who bore the Gold-headed Cane, was Dr. Baillie. The last man in London who is believed to have worn the scarlet coat, flap waistcoat, and frilled sleeves, was a quack-doctor who lived in the corner of Salisbury Square, and who might be seen any day pacing the pavement in front of his establishment until he took to his bed and died of extreme old age.

“Cries of London,” which formerly added to the noise in the streets, have become “beautifully less.” Our great fish-market Billingsgate, proverbially infamous, has been reformed. On a dark winter morning it was a strange scene, its flaring oil lamps showing a crowd struggling amidst a Babel din of vulgar tongues, such as rendered the name a byword for low abuse. Opprobrious foul-mouth language is called “Billingsgate discourse” in Martin’s Dictionary, 1754. In Bailey’s Dictionary we have “a Billingsgate, a scolding, impudent slut.” Tom Brown gives a very coarse picture of her; and Addison refers to “debates which frequently arise among the ladies of the British fishery.” She wore a strong stuff gown, tucked up, and showing a large quilted petticoat; her hair, cap, and bonnet were flattened into a mass by carrying a basket of fish upon her head; and her coarse cracked cry, brawny limbs, and red bloated face, completed this portrait of the Fish-fag of other days. Not only has the virago disappeared, but the market-place has been rebuilt and extended; there is no crowding, elbowing, screaming, or fighting, as heretofore; coffee has mostly superseded spirits, and a more orderly scene of business can scarcely be imagined. We are glad to part with the fish-fag, as well as with the Sunday cry of mackerel, which, by Act of Parliament in 1846, was declared illegal; though the cry had been permitted since 1698.

We as willingly part with the Chimney-sweepers, those “dim sparks, poor blots, innocent blacknesses,” and rejoice at the abolition of the cruel practice of employing boys to sweep chimneys. With their dreary gambols, and tinselled squalor, they almost monopolised the metropolitan May-day in our time. Their “crying the streets,” was plaintively significant of their hapless condition. Theirs was one of the “sullyng trades” which Gay, in his “Trivia; or, The Art of Walking the Streets,” thus taught his readers to avoid:—

“The little chimney-sweeper stalks along,
And marks with sooty stains the heedless throng;
When small-coal murmurs in the hoarser throat,
From smutty dangers guard thy threatened coat.”

The tin News-horn, often disturbing a quiet West-end locality with its blatant noise, is heard no longer, and we

see it only upon the face of one of our weekly newspapers, established when the post-horn was in full blow. The Postman, with his clanging letter-bell, left us in June, 1846. He was a modern compared with the City Bellman, instituted some three centuries ago, to go about the wards by night; and, ringing his bell at certain places, exhort the inhabitants, with an audible voice, to take care of their fires and lights, to help the poor, and pray for the dead. The Watchman was of much earlier date; and we remember to have seen him upon old London Bridge, in the costume of centuries long before. The City Watch bore the halbert until a comparatively late period. The watch was more efficient in the City than elsewhere; the Scourers and Mohocks frequented St. Clement Danes and Covent Garden, breaking the watchman’s lantern and halbert, and frequently locking him up in his own box.

Amongst the cries were those of the venders of victuals for wayfarers, in which the pieman took the lead. The economy of this trade may be imagined from the Farthing Pie-house, in the New Road, where, almost to our time, bits of mutton were put into a crust shaped like a pie, and actually sold for a farthing! Holloway was then famous for its Cheesecakes, which, within recollection, were cried through London streets by men on horseback. Curds and whey were sold at the lodges of the parks; Hyde Park had its Cake-house; and Milk Fair, at the Spring Garden gate of St. James’s Park, with its lowing cows and squalling children, lasted until the past year; though the noisy milk folks had long ceased their cries, “A can of milk, ladies!” “A can of red cow’s milk, sir!” We miss, too, from our streets, the Saloop stalls, at which was sold salep, made from boiling the half-baked roots of an orchis with water; though subsequently, Saloop was a decoction of sassafras. Both drinks were much used before the introduction of tea and coffee at greatly reduced prices. Instead of this out-door accommodation, we have thousands of coffee-shops in the metropolis, where the mind as well as the body is cared for, by the provision of periodical publications of the useful and entertaining class. The last Saloop-house we remember in London was at the east end of Fleet Street.

THE MIDNIGHT SKY AT LONDON.

JANUARY.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

THERE cannot be a more magnificent spectacle in nature than a fine moonless starlight night in winter, when so many independent worlds, at infinite distances from us, are at one time exhibited for our contemplation. To give some information about this starry host, brief, however, as it must necessarily be, and to point out those parts of the heavens where the principal stars are to be found, will be the writer’s object.*

Before proceeding to explain the diagrams which illustrate these papers, it may be proper to remark at once that it matters little in what part of London or its neighbourhood the observer may be located, whether it be near St. Paul’s, Hampstead, Kensington, or Greenwich, for there is no sensible difference in the appearance of

* Thomas Carlyle, in referring to the teaching of science in schools and families, says, “For many years it has been one of my constant regrets that no schoolmaster of mine had a knowledge of natural history, so far at least as to have taught me the grasses that grow by the wayside, and the little winged or wingless neighbours that are continually meeting me, with a salutation that I cannot answer, as things are! *Why did not somebody teach me the constellations, too, and make me at home in the starry heavens, which are always overhead, and which I don’t half know to this day?*”

the heavens at these places. More than this, our diagrams will be generally available for the whole south of England, or for any country in the same latitude as London, bearing only this in mind, that the views will represent the sky at the *local* midnight of each place. In comparing the diagrams with the sky the observer is supposed to be looking, as the case may be, either *due* north or south, along the meridian of his station. At first, it may be difficult with some to know which is the meridian. If, however, the Pole star can be identified, this is soon found; for, by drawing an imaginary line from the pole through the zenith to the horizon, the meridian-line of a place is determined. Some plain and well-known rules for the easy finding of Polaris will be given presently. We may also remark that stars near the east and west horizons will not be found in our views of the heavens for two reasons. First, because, when the eye is directed in the plane of the meridian, stars low down in the east and west are not visible to the observer at the same time; and, secondly, if the whole sky were included, the scale adopted for the diagrams would be too small for the proper identification of the different objects. When, however, stars of superior magnitude are visible in the east and west, we hope in the course of our remarks to point them out clearly, so that the youngest reader of the "Leisure Hour" may be able to find them. We have also considered it better to omit the moon and planets, on account of their constantly changing positions; but the courses of the different planets among the stars will be explained, when they are in such positions as to attract universal attention. On such occasions Jupiter and Venus eclipse in splendour every fixed star, especially Venus, when near its extreme elongation from the sun, at which time it has been known to cast a sensible shadow. We have no doubt, however, that the amateur observer will find no difficulty in detecting, with the aid of our diagrams and descriptions, any particular large planet which may from time to time be visible among the fixed stars. Let us take the lower map first.

The observer is to consider himself now looking directly south along the meridian of his station, exactly at midnight on January 15. On comparing the diagram with the stars, he must understand that the upper boundary line is due east and west, and that the exact centre of the line corresponds to the zenith immediately over his head. Passing the eyes down gradually on the meridian from the zenith, two bright stars will be sure to attract his notice. These are Castor and Pollux, the two principal objects in the constellation of Gemini, the twins. Proceeding still on the meridian towards the south, a star of the first magnitude is reached. This is Procyon, in the loins of Canis Minor, the lesser dog. Now if we turn slightly towards the west, a splendid galaxy of stars strikes the eye; for here we have the beautiful constellation of Orion, while nearer the horizon, in the S.S.W., Sirius, the brightest fixed star in the heavens, shines forth with dazzling lustre. These celebrated objects have been the principal stars of the southern sky during the evening hours up to midnight. Below Sirius, several bright stars in Canis Major, the greater dog, are visible. High up on the right, over Orion, the constellation Taurus is to be seen, with the reddish star Aldebaran, in the eye of the Bull, with its neighbouring clusters, the Hyades and Pleiades. Turning a little to the east, or left, Leo, with its numerous bright stars, is seen approaching the meridian, and, lower down, Hydra, with its principal star, Alphard, conspicuous only by the absence of others of equal magnitude within a considerable distance. Due west of the

zenith the bright star Capella, in Auriga, is easily distinguished, followed by the second star in the constellation, Beta Auriga.

These remarks, referring to the time of midnight on January 15th, are also strictly applicable to four minutes before midnight on January 16th; eight minutes before midnight on January 17th, and so on. The appearance of the heavens thus changes with respect to the meridian at any stated time about four minutes each day, a whole year passing away before the same star can culminate at the same hour of solar time. For example, the stars which pass the meridian at midnight on January 15th, 1868, will not pass again at that hour till about January 15th, 1869. Thus our diagrams, which illustrate the appearance of the sky for midnight on January 15th, will serve for 10 p.m. on February 15th, 8 p.m. on March 15th, 6 a.m. on October 15th, 4 a.m. on November 15th, and 2 a.m. on December 15th.

The principal constellations visible in the south at this time are Taurus, Gemini, Cancer, Leo, Orion, Canis Major, Canis Minor, Hydra, and parts of Auriga, Lynx, and Ursa Major. There are several others of lesser note.

Orion is perhaps the finest agglomeration of stars to be found in any portion of the heavens. It is also one of the best known of the constellations. Its form is something of a quadrilateral, in the centre of which are three stars of the second magnitude, known as Orion's belt. These three stars have been also designated as the gold grains or spangles of the belt; but in former times they received the names of Jacob's Staff, the Golden Yard of Seamen, the Three Kings of Soothsayers, besides several others. They point on the one side to the bright star Sirius, and on the other to the red star Aldebaran, and the Pleiades. Betelgeuse and Rigel, two of the stars in the quadrilateral, are of the first magnitude. In this constellation, upwards of one hundred stars are visible to the naked eye, all of which are no smaller than the sixth magnitude. Excepting the two most brilliant, there are four stars of the second, and five less than the second, but greater than the fourth magnitude. Orion can be seen all over the world, and is a favourite constellation in all countries. Its figure, belt, and pendant, as marked out by the stars, cause it to be easily recognised.

Orion has been mentioned by name by several of the old Greek and Roman writers. Modern hero-worship has been carried to such an extent that it has been suggested to change this name for that of noted individuals. For instance, in our own country it has been proposed to give the constellation the name of Nelson; while in 1807 the University of Leipsic actually resolved that all the stars forming the belt and sword of Orion should henceforth be known only by the name of Napoleon! The old appellation is, however, too much engrafted into the minds of all to permit a change of this kind, and the name of Orion will most probably be retained for many ages to come. The late Admiral Smyth, so well-known as an amateur astronomer and antiquarian, has remarked that "both the Septuagint and the Vulgate call it Orion, according to the Greeks and Romans. It is mentioned in Job, Ezekiel, and Amos; and some persist that it represented Nimrod, as mighty a hunter as Orion, and the author of the post-diluvian heresy. From his terrible and threatening gesture, as much as from his time of rising, he was held to portend tempests

* * * The position of the stars, small and great, in the accompanying maps, is specially laid down from a direct computation of their altitudes and azimuths, and afterwards compared generally with a printed chart. In the upper view the observer is supposed to be looking north over St. Paul's, and in the lower view looking south over Greenwich Hospital and the Royal Observatory.

APPEARANCE OF THE MIDNIGHT SKY AT LONDON, LOOKING NORTH, JANUARY 15.

APPEARANCE OF THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, JANUARY 15.

and misfortune, and was therefore much dreaded by the mariners of yore."

A small quadruple star, visible as one object below the belt of Orion, is the centre of one of the finest nebulae in the heavens. When viewed through a telescope, this wonderful object has been likened to a fish's head, to which it certainly bears a resemblance. With a twenty-foot reflecting telescope at Slough, Sir John Herschel could not compare it to anything better than a curdling liquid, or a surface strewn over with flocks of wool, or to the breaking up of a mackerel sky. It also appeared to him that the mottling of the disc of the sun is something similar to this great nebula, although the granular look was decidedly coarser, and the intervals darker. The woolly flocks, instead of being round, were drawn into little wisps. No trace, however, could be perceived of its being composed of stars, the aspect being altogether different from that of the nebulae which have been resolved into stars. The Earl of Rosse, with a telescope still more powerful, has seen little more than that described by Sir John Herschel. Very recently, the light of this nebula has been examined with the spectroscope by Mr. Huggins, who has found that, after passing through the prisms, it remains concentrated into three bright lines. A spectrum of this kind is known to be the result only when matter in the gaseous state is rendered luminous by heat. From the positions of these bright lines in the spectrum, it has been inferred with great probability that hydrogen and nitrogen, with a third substance not yet recognised, is present in this and other nebulae of the same class.

The constellation Taurus, of which Aldebaran is the principal object, is composed of a great number of stars, the atlas of Bode containing no fewer than 400; the majority are, however, stars of comparatively small magnitude. Two well-known clusters, the Pleiades and Hyades, are included within the boundaries of Taurus. Aldebaran, in our diagram, is about half-way between the zenith and the horizon, towards the west or right hand, the Pleiades being apparently slightly above it. This well-known cluster consists of a group of stars in the shoulder of the Bull. They have been mentioned in poetry as far back as Hesiod, who alludes to them as the Seven Virgins. In the ancient manuscript of Cicero's "Aratus," preserved in the British Museum, they are named Merope, Alcyone, Celieno, Electra, Maia, Asterope, and Taygeta. Though they have been named the "seven stars," yet to ordinary eyes six only are visible. On brilliant moonless nights, however, not only have the ancient seven been perceived, but several more. An observer, the discoverer of the new star of 1604, saw occasionally fourteen without any glasses, a feat which has not been repeated by any other person. A member of the family of the present Astronomer Royal has habitually seen seven stars, and on very rare occasions, when the sky is unusually clear, twelve have been distinguished. On February 15th, 1863, a map of the stars was drawn as viewed by the unaided eye, without knowing at the time the actual relative positions of the different stars. On comparing this map with one constructed from the telescopic measures of M. Bessel, there was no difficulty in identifying the twelve stars as amongst those which Bessel had named by certain arbitrary numbers. A tolerably good telescope will exhibit about a hundred stars in the Pleiades.

A very strong interest in this remarkable group has been excited in many minds by the scriptural mention of them in the book of Job, conjointly with a few other stars, while the patriarch is being convinced of his ignorance and imbecility—

"Canst thou bind the sweet influences of Pleiades, or loose the bands of Orion?"

Canst thou bring forth Mazzaroth in his season? or canst thou guide Arcturus with his sons?

Knowest thou the ordinances of heaven? canst thou set the dominion thereof in the earth?"

The remarks of Admiral Smyth on these words will, we are sure, be interesting:—"Now this splendid passage, I am assured, is more correctly rendered thus:—

'Canst thou shut up the delightful teemings of Chimah?

Or the contractions of Chesil canst thou open?

Canst thou draw forth Mazzaroth in his season?

Or Aish and his sons canst thou guide?"

In this very early description of the cardinal constellations, Chimah denotes Taurus, with the Pleiades; Chesil is Scorpio; Mazzaroth is Sirius, in the 'chambers of the south;' and Aish the Greater Bear, the Hebrew word signifying a *bier*, which was shaped by the four well-known bright stars, while the three forming the tail were considered as the children attending a funeral. St. Augustin, in his annotations on the above passage, assures us that, under the Pleiades and Orion, God comprehends all the rest of the stars, by a figure of speech, putting a part for the whole; and the argument is that the all-powerful Deity regulates the seasons, and no mortal can intermeddle with them or presume to scan the ordinances of heaven."

We have not space to continue our remarks on the sky south of the zenith; these must be deferred till next month. In the meantime, the positions of the principal constellations and stars can be found from the explanation already given.

The observer is now requested to turn himself bodily round, and to face *due* north. Let us first fix our attention on the position of Polaris, or the Pole star. We are then sensibly looking in the plane of the north meridian. The easiest way to look for Polaris is to find the seven stars in the Great Bear—a constellation which must have attracted the attention of everybody some time during his lifetime. When found, note the two first of the seven stars. At midnight, in January, they will be the two nearest the zenith. Now, these two stars have for ages been popularly called the Pointers, because, in one direction, they point very nearly to the pole of the heavens, and to the Pole star, which is situated in a part of the sky free from other stars of a similar magnitude. Probably there will be little chance of mistaking any other for it after reading the following lines:—

"Where yonder radiant hosts adorn

The northern evening sky,

Seven stars, a splendid glorious train,

First fix the wand'ring eye.

To deck great Ursa's shaggy form,

Those brilliant orbs combine;

And where the first and second point,

There see Polaris shine."

Having found Polaris, we will now compare our northern diagram with the sky. The reader must, however, be again reminded that the proper way to make this comparison is to consider that the zenith over-head corresponds exactly with the centre of the boundary line in the upper part of the diagram. To the left of Polaris in the north-west is Cassiopeia. Perseus is in W.N.W., nearly midway between the zenith and horizon. Underneath the Pole star, slightly west of the meridian, Cepheus will be found, and nearer the horizon Cygnus, with the bright star Alpha Cygni, or Deneb. Turning to the east of the meridian, Ursa Minor will be noticed as containing seven stars, arranged similarly to Ursa Major, the tail being, however, curved in the opposite direction. Below Ursa Minor the constellation Draco is situated, and, nearer the horizon in the north-east, parts of Hercules and Boötes. The position of Ursa Major is evident at a glance. The bright star Alpha Lyrae, or

Vega, may be seen on very clear nights in the north at midnight about a degree above the horizon.

The principal constellations of the north sky are Ursa Major, Ursa Minor, Cassiopeia, Perseus, Draco, and Cepheus. They are all circumpolar, and consequently in the latitude of London never set below the horizon. They pass the meridian twice during the twenty-four hours, once above and once below the pole, and are to be seen on any clear night throughout the year, sometimes in the east, sometimes in the west, and at other times north or south of Polaris. An examination of the complete series of diagrams illustrating these papers will show at sight these seasonal changes of position. But he must be a very careless observer indeed who has not noticed that these changes of position are also of daily occurrence, arising from the earth revolving on its axis once in twenty-four hours. Let us, as an example, note the position of the Great Bear at six o'clock in the evening of any day in January; at this time it will be found adorning the heavens towards the north-east horizon; at midnight it will be as depicted in our diagram; at six o'clock in the morning it will be in a corresponding position on the opposite side of the meridian; and at noon it will be towards the north-west horizon, when all the bright stars can be easily observed by the aid of ordinary telescopes. In observatories there is now no difficulty experienced in making astronomical observations of the principal objects in daylight; on the contrary, most of the stars included in the diagram of the northern sky can be seen at all hours of the day when passing the meridian. In the days of Flamsteed ordinary telescopes were not sufficiently powerful for this purpose; but in order to observe daily, if possible, a celebrated star, Gamma Draconis, which passes over the zenith of Greenwich, he had a deep well excavated, in which he erected a long tube or telescope. After having seen a contemporary drawing of this well, showing the observer, probably Flamsteed himself, at the bottom in the act of making an observation in an apparently damp and uncomfortable position, we cannot avoid comparing his rude instrumental means with the beautiful and precise reflex zenith tube now used at Greenwich for the daily observation of the same star.

Ursa Major extends over a considerable portion of the northern sky. Of the seven principal stars which popularly define the form of the Bear, the four nearest the zenith in our diagram compose the body proper, and the three lower stars the tail. Six of the stars are nearly of the same magnitude, but that belonging to the part of the body next to the tail is decidedly smaller, being no greater than the third and a half magnitude. These stars have been for a long period known by many popular names, the principal being "Charles's Wain," and "the Plough." One zealous writer, Kircher, claims the four stars in the quadrilateral as the bier of Lazarus, the three in the tail representing Mary, Martha, and Mary Magdalen. Charles's Wain is the name by which it is most known by country people. In this instance the four stars are termed the wheels, Dubhe and Merak, the Pointers, being the fore-wheels, the two next the hind-wheels, while the remaining three represent the shafts of the waggon. With regard to the Great Bear, very little imagination is required to make out some kind of resemblance to that animal, for, in addition to the body and tail, indicated by the principal stars, there are others of the third and fourth magnitude that fix the outline of this imaginary animal with an astonishing degree of precision. We say advisedly *imaginary*, for we had some difficulty lately in persuading a well-dressed lady

that such was the case, and it is a question whether she really was convinced of her erroneous ideas. Her opinions had been firmly fixed in her mind from what she had recently heard at a popular astronomical lecture, where it was stated that with large telescopes the form of the animal could be plainly seen. We were unable to ascertain the name of the learned lecturer.

In subsequent articles we shall continue our brief descriptions of the principal stars and constellations visible in this country, selecting, as at present, two or three at a time for illustration.

During the month of January, 1868, the planets Venus and Jupiter may be easily distinguished in the early hours of the evening in the south-west, above all other stars in that part of the sky. In the latter end of the month they will be close together, their conjunction in right ascension taking place on the evening of the 30th. This phenomenon will be exceedingly striking, from the great brilliancy of the planets; the distance between the two being only two-thirds of the diameter of the moon. Those of our readers who may be in possession of ordinary telescopes, fitted with an astronomical eye-piece of low power, may see Jupiter with his four moons and Venus in the field of view at one time. Such an occurrence is very rare indeed. Venus sets on January 1st at 5.52 p.m., and on the 31st at 7.31 p.m.; while Jupiter disappears below the horizon on the 1st at 8.50 p.m., and on the 31st at 7.20 p.m. Mars and Saturn are unfavourably situated for observation; the latter may, however, be seen in the south-east shortly before sunrise. Uranus is in the constellation Cancer. It is only occasionally visible to the naked eye; but, with a telescope, it can be soon identified by its small round disc. The moon is in Pisces till January 3rd; on the 4th and 5th in Aries; on the 6th and 7th in Taurus; on the 8th and 9th in Gemini; on the 10th in Cancer; from the 11th to 13th in Leo; on the 14th and 15th in Virgo. During the remainder of the lunation the moon rises after midnight. She will again be visible a few days after new moon, as a thin crescent in the south-west evening sky, among the small stars in Aquarius and Pisces.

PEEPS THROUGH LOOPHOLES, AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDE.

INTRODUCTORY.

THERE are some lines in my favourite poet, Cowper, which have always greatly taken my fancy. They are in that fourth book of "The Task," in which he so exquisitely describes the domestic happiness of a winter evening; when the post has come in, and the newspaper is read by the warm fireside to the bubbling music of the urn. And the lines are these:—

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd;
To hear the roar she sends through all her gates
At a safe distance, where the dying sound
Falls, a soft murmur, on th' uninjured ear."

Cowper must have written these lines from his very heart. They have the true *con amore* style—if, indeed, that can be called style, which is nothing more than the natural and unforced expression of the personal thoughts and feelings of the writer, flowing from his pen as spontaneously and freely as the bright pure stream flashes from the hill side. They show us—as does the whole of his noble poem—the very man himself, and we can identify him in every paragraph. In "The Task," we see his own self-portraiture, painted by a master-hand; and

we may read it as an autobiographical poem, in which roving fancies have "excursive flights," like milk-white or purple-tinted doves that gleam in mazy evolutions in the blue sky, and then circle to their own dove-cot.

The lines just quoted depict, in a very striking way, one side of the portrait of this true poet. Like the night-ingale, he preferred to sing "darkling, and in shadiest covert hid." Not that he was indifferent to the doings of the world, or unobservant of the great Babel's crowd, or deaf to its ear-splitting tumult and riotous hurly-burly. No; few men had a keener eye than he for noting the many shades of character, and the specialities and idiosyncrasies of constitution and temperament, that might be observed in the heterogeneous collection of poor humanity that formed "the crowd," in which he had no desire to be jostled, and whose roar he preferred to hear at a safe distance. Unlike Dr. Johnson, he would not have proposed to "take a walk down Fleet Street" as a refreshing recreation after hours of mental toil and desk work; yet he did not deem it unpleasant to peep at such a world through the loopholes of retreat, and to derive both instruction and amusement from what he saw. For, despite that dark and melancholy cloud that too often overshadowed the bright cheerfulness of his faith, we do not depend solely upon the testimony of Johnny Gilpin to prove to us that William Cowper was full of sprightly satire and sportive fun, that bubbled over his verse in innocent enjoyment, even when his pen was pointed for sublimer strains. Terrible and scathing satire, too, could be flashed from the thunder of his verse, when its theme dealt with those who deemed themselves wiser than Wisdom itself: as when he spoke of those who drill and bore into the deep strata of the earth and extract from it a register, from which they learn that He who made that earth and revealed its date to Moses "was mistaken in its age." When he wrote this—and it has its force at the present day—he thereby proved how closely he marked the current ways and doings of men; yet he had just been describing himself as a stricken deer, who wandered, with a few associates, in remote and silent woods, and therein ruminated with new "views of men and manners." And again he recurred to the same idea of retirement, in the passage commencing with the line, "O blessed seclusion from a jarring world," wherein he spoke of the peace to be found in retreat, and the guileless joys that he experienced in "constant occupation without care."

But still, while thoroughly enjoying this retirement and revelling in the blissful quiet of his retreat, he nevertheless found it pleasant to peep through its loopholes at the bustle of the outer world. And, doubtless, there are many of us who can thoroughly sympathise with Cowper in this, although it may not be in our power to imitate him and to quit the various posts that have been assigned to us in the business and battle of life. And, however much we may long for the sequestered calm that we may imagine would be found in the "lodge in some vast wilderness," yet that lodge would be as unattainable (and, most probably, as undesirable) a home to most of us as though it were Robin Hood's bower, or the Temple of Fame, or Windsor Castle itself. If we followed the bent of our own inclinations, we might possibly prefer to have our dwelling-place in some quiet retreat in the God-made country; yet, if our calling has placed us amid the busy haunts of the man-made town, we can—if we are so minded—equally find therein room and opportunity for the culture and enjoyment of domestic happiness, that "only bliss of Paradise that has survived the fall." And we may be sure of this, that, whether our home be in town or country, it stands

to us in the place of a fortress, from whence we may fight back the woes and wearinesses of the outer world whenever they openly assail us or strive to undermine our well-being. The dictum laid down by Sir Edward Coke, in his "Institutes," that a man's house is his castle, has passed into a time-honoured and respected saying, and been accepted as a fact that may not be denied with impunity. When therefore we wish to withdraw ourselves from the clamour of public life, all that we have to do is to ensconce ourselves in our respective castles; and through our castle's loopholes we may, if we choose, peep at the stir of the great Babel and listen to its roar, observant of what is passing, and surveying at our ease the thronging, jostling crowd. There are few of us probably who would object to share in this easy retirement, combined with watchful scrutiny of passing events. Such peeps through the loopholes of retreat are as innocent as they are natural. There is nothing about them of that vulgar impertinence or gross curiosity that we should attach to the conduct of a modern Paul Pry or Peeping Tom; but, on the contrary, they are coupled with an innate feeling of modest bashfulness that causes us to shrink from obtruding ourselves on those who have not expressed a wish for our company, but whom we cannot avoid observing. We may lawfully and artlessly peep at what is going on without fussily interfering in matters which do not concern us, and we may be permitted to comment upon what we see and hear, so long as we do so in a charitable spirit and without offensive personality. The amiable and Christian-minded poet of "The Task" loved to take such peeps, and he recorded what he saw with a mingling of stern reproof and tender counsel, hearty praise and earnest words, playful humour and masterly power, which has never been surpassed. They who follow in his steps, however distantly and falteringly, will surely not err in imitating the example of the best and most genial of England's moral poets in their Peeps Through Loopholes.

I.—A SNUG WINTER EVENING AND ITS LAUREATE.

It was but a week or two ago that, peeping through the loopholes of my retreat in a sequestered village, I spied a merry group of cottage children dragging a rough block of timber along the road. There was no snow as yet, but there had been a rime frost that morning; and, although the sun shone with a wan smile, yet its power had not been sufficient to thaw the hard surface of the soil; and the children were dragging along their log as though it scraped over a surface of iron. They had yoked themselves to the clump of wood by an old knotted piece of rope, and, as they tugged at their burden with all their might and main, their creased and dimpled limbs, and sturdy legs, and plump cheeks, gleamed out as bravely as they would have done from the canvas of Rubens; though it was a scene that would have been more deftly treated by the graceful pencil of Le Jeune, who would have preserved the poetic aspect of the group at the same time that he would have depicted it true to rustic nature. I certainly thought it a pretty picture, and was glad that I had peeped at it through the loopholes of my retreat. The children did not see me, nor did I betray my nearness to them by any words or question; but, while the wintry robin sang his carol in the "nipping" and the "eager air," I watched them until a turn of the road hid them from my view. Their Christmas log was seen by me no more, although for many minutes longer I could hear it scrunching over the hard ground, its progress heralded by the merry laughter and cheery shouts of the children. I wondered to

myself for what hearth that log was intended, and I felt sure that it would be a happy fireside if that band of children were to be gathered around it, because the ring of their joyous laughter was pealed by the joy-bells of innocence, whose harmony is echoed in heaven. There is no chime like it; for, as age increases, and childhood passes into youth, and youth is lost in manhood, the clear and silvery modulations become deeper and more sonorous, more uncertain, too, more harsh and discordant, until they end in the muffled peal that knolls the requiem of old age.

And so the children were lost to my sight, and, in my heart, I bade them a happy Christmas, and all bright and sparkling merriment from the crackling fire of their Christmas log. And then I returned from my loophole to my house to enjoy an hour of what Cowper calls "parlour-twilight," when the body is at ease and the thoughts can rove freely; and I fell to musing on what I had seen; and that Christmas log set my fancy on a tour of wandering and wondering. But chiefly did I occupy myself with thinking over the many domestic delights that the winter evening brings, and on the various other logs, beside the yule-log, which it introduces to the family hearth.

For human society is so constituted that it has to go about like another Caliban, bearing a burden of logs, and sometimes falling flat beneath their load. It is true that the wondrous young prince, Ferdinand, may bend his back to the thankless task of removing "some thousands of these logs," and that the beauteous Miranda may crave to assist him in the task; but then they were exceptional creations—a duke's daughter and a king's son, who were masquerading in disguise on a mythical island peopled by "fairy, airy spirits;" and, although the young gentleman confessed himself to be a "patient log-man," yet he did so all for love, and the fair Miranda found him to be anything but wooden-headed, even when he played with her at chess in her father's cell. But we live in a more prosaic age than did Prospero, and instead of encountering a disguised prince in a "patient log-man," we are continually brought face to face with King Log himself, the representative of those human logs that sit heavily on innocent enjoyment and tyrannise over harmless mirth. It was the witty royalist divine, Dr. South, who said, "Though philosophy teaches that no element is heavy in its own place, yet experience shows that, out of its own place, it proves exceedingly burdensome." And this is precisely the case with the human logs of social life; they are well-nigh unbearable when they are encountered out of their own proper spheres. Among themselves, and in their own particular province, they doubtless form a Mutual Admiration Society, and reserve their special meeds of praise for those who are in reality the heaviest and most loggy, but who, in their eyes, are the most admirable specimens of their peculiar product. In actual life they are ponderous and burdensome to a disagreeable degree, and are by no means the characters who would promote the enjoyable snugness of the winter evening.

Think of being condemned to pass such an evening with a stuck-up family who regard (let us say) the Christmas plum-pudding and mince-pie with no more sympathy or thrill of pleasurable excitement than they would look on an every-day apple-tart or mould of jelly. Only reflect, for a moment, on the constitutional temperament of such human logs as these, who would profess to be "quite above that sort of thing." Depend upon it, that those people who—to use an expressive colloquialism—would not "warm" to Christmas fare, would walk through the most impressive cathedral in

Christendom without a throb of emotion, and would listen to Handel's grandest anthem, or the singing of the charity children at St. Paul's, without turning a hair. Their pulse would never quicken at such sights and sounds. They are frigid, cold-blooded people, and, for all purposes of human sympathy, might be so many logs—but not the logs we would desire to associate with the Christmas season and the snug winter evening.

Think, too, of the annual family dinner given by a purse-proud couple to their poor relations; a one-day's reception and recognition that is intended to atone for 364 days of neglect. The dinner may be profuse, well-cooked, and appetizing; the fire may be bright and glowing; but, so long as the founders of the feast are two human logs, the banquet itself will be equally ponderous. There will be nothing about it to suggest the feast of reason and the flow of soul; it will not even have the doubtful flavour of the dreamy, intellectual ecstasy of a Barmecide's feast; but it will be one ghastly scene of eating and drinking through three courses and a dessert, made more indigestible from the prolonged and dismal failures at free-and-easy conversation and friendly chat. A winter evening such as this must be classed among the miseries of human life.

We may be sure that the delightful and amiable Cowper was never reckoned among the logs of society. He could not, it is true, keep the table in a roar; he left that to those who could boast of "more mercurial powers;" rather, he would keep the company in a gentle pleasurable simmer, like his own bubbling tea-urn. But he was an intense participator in those domestic joys that may be obtained on a winter evening, when the fire is bright, the curtains are drawn, and innocent employment and amusement are before us until the hours of bedtime. He was a poet thoroughly English in all that he thought and wrote. He loved his country, with all her faults; and confessed that he was constrained to love her so long as a nook was left where English minds and manners might be found. And, in depicting the quiet happiness of domestic life, he has given to the world a faithful portraiture of that national snugness that seems indigenous to English soil. In William Cowper, snugness has found its laureate. We must not altogether forget that there are not only degrees, but a diversity in snugness; for there is a snugness that begets a glow of sympathy, and there is a snugness that produces the ice of selfishness. Commend us to the former, and save us from the latter! Refrigerators are very useful in their way; but social refrigerators, who freeze up the fountains of charity and congeal the milk of human kindness into thick ice, are not at all the sort of people with whom we should desire to spend our winter evenings. The snugness that was prized and lauded by Cowper was a delicious and enviable snugness—a touch of that nature that makes all the world of kin. Though the frost raging abroad and the rough wind endeared "the silence and the warmth enjoyed within," he could not only peep from the loopholes of his retreat at those who had to bear "the pelting brunt of the tempestuous night," but "sympathise with others suffering more"—the industrious poor, who were ill-clad and sparsely fed, and to whom the "sweet colloquial pleasures" of the winter evening were but few. Unless he had shown his care for those who claimed compassion and found "a friend in every feeling heart" he could not have enjoyed his own comforts. For, as quaint old Fuller tersely says, "Hospitality is three-fold: for one's family—this is of necessity; for strangers—this is of courtesy; for the poor—this is charity." Therefore the winter season was peculiarly the time for the avaricious

to lay aside his avarice, the churl his churlishness, and the covetous his covetousness, so that, in the words of Sir Walter Scott, "the alms which open-hearted charity bestows with kindly glance" might be "an offering sweet to the bright throne of mercy," and even the poorest and humblest might enjoy that best of luxuries—the luxury of doing good.

But, certainly, if snugness lacked a laureate, he would be found in Cowper. His delineation, in "The Task," of the snug winter evening is a picture that is positively without its *pendant* in English poetry. For powerful simplicity, aptness of language, and exquisitely tender touches of art, it is unrivalled.

"Now stir the fire, and close the shutters fast,
Let fall the curtains, wheel the sofa round,
And, while the bubbling and loud-hissing urn
Throws up a steamy column, and the cups
That cheer but not inebriate wait on each,
So let us welcome peaceful evening in."

Every word in each of these six lines is as plain in its language as it can be; for Cowper "calls a spade a spade," as Dean Swift said in his poems, and as Burton had said before him in his "Anatomy of Melancholy." He mentions the sofa, the shutters, the urn, and the cups by their proper names, instead of referring to them in roundabout periphrastic epithets, as Pope does in his "Rape of the Lock"—a poem as perfect, in its way, as "The Task" itself; and yet the very simplicity of Cowper places before us a more perfect picture of snugness than any more elaborated description could achieve.

How superior, for example, in faithfulness of delineation and propriety of language is the poet of "The Task" to the poet of "The Pleasures of Hope!" The former truly mirrors the snug winter evening "that I, and mine, and those we love, enjoy;" and the latter, when seeking to describe a similar evening, as it might "be supposed to arise in the mind of one who wishes, with enthusiasm, for the union of friendship and retirement," does so in such words as these: "Trim the gay taper in his rustic dome." Now, in the candle-maker's shop-windows we have seen tapers spirally ornamented and of divers brilliant colours; but Campbell's "gay taper" would hardly be of this kind, and would give but a poor light to the "rustic dome." And what, in the name of simplicity, is a "rustic dome?" Imagination suggests the idea of a portion of the Brighton Pavilion dwarfed to a cottage; and, if fancy is playing us tricks, the fault is Campbell's. And, in his verse, he directs the window to be left "half uncurtained," so that, haply, "some way-worn man, benighted in the vale," might see the light of that wondrous gay taper; a miserable state of things for those who had to pass the evening under the rustic dome, especially if the lady of the house was nervous. But Cowper, on the contrary, who thoroughly understood what was provocative of snug comfort, says, "Close the shutters fast, let fall the curtains." And, all through that vigorous word-painting of "The Winter Evening," how pleasantly does he recur again and again to its "gentle hours," the hours "of social converse and instructive ease!" He loved the season that brought with it the cheer of Christmas and the glad welcome of the New Year; and, therefore, he crowned Winter "king of intimate delights,

"Fireside enjoyments, home-born happiness,
And all the comforts that the lowly roof
Of undisturb'd Retirement, and the hours
Of long uninterrupted evening, know."

Again I say, if snugness lacked a laureate, this description of the domestic happiness of the winter evening would be a sufficient claim for the post to be filled by the delightful poet of "The Task."

Original Fables.

BY MRS. PROSSER.

CROWING HENS; OR, WOMAN'S RIGHTS.

"WHY shouldn't *we* crow?" said the speckled Hen.

"Why not?" said the white Hen.

"Why not?" said all the Hens, as the question went round.

"We are as clever, as strong, as handsome, and as good every way as that domineering old Cock; in my opinion we are superior!" said the speckled Hen.

"And in mine," said the white Hen.

"And in mine," said all the Hens, much impressed and excited by this new view of things.

So they practised, and stretched out their necks, and stuck their heads on one side, all in imitation of the old Cock; and a very remarkable noise they made.

"Hey-day!" said Drover, stopping as he ran through the yard to listen to the hubbub; "my dear creatures, what are you at? Give up this nonsense; while you keep to clucking you are highly respectable, but when you take to *crowing* you can't think what ridiculous figures you cut—keep to clucking, dears, keep to clucking!"

SECOND THOUGHTS ARE BEST.

"ANYTHING is better than this!" exclaimed a Thrush, after having vainly battered about a frozen snail, which she at last gave up in despair.

"Anything is better than *this*!" chirped a Robin in a melancholy tone, as he saw the last crumb picked up by a sparrow before he could hop to it, and knew his breakfast was gone.

"*Anything* is better than *this*," murmured a Blackbird, perched on a leafless branch, with his feathers puffed out to twice their usual size. "Why doesn't Master John come and shoot us with his gun? That sharp, short death would be easy compared with this lingering misery!"

"Poor dear creatures!" cried the black Cat, who had been watching them and listening behind a snow-drift. "You are all quite right. Take my advice and bear it no longer; and, as Master John doesn't seem to be coming, let me, in a friendly way, put you out of your troubles!"

Away they all flew, at the very sight of her ears above the drift, without waiting to hear her offer.

"I knew how it would be!" she cried, more provoked than surprised. "Though they are silly enough to talk nonsense, they are wise enough to know better than abide by their words."

HOW FOLKS DECEIVE THEMSELVES!

"ROTTENNESS is necessary to perfection," said the Medlar to the fruits. "My sister, the olive, is nothing till near decay; and my brother, the fig, must burst before he is eatable."

"Hear him! only hear him!" said an Apple, glowing with healthy ripeness; "does he expect, with that wizened brown face of his, to stare health and beauty out of countenance? He might be thankful with the exception made in his case, without trying to upset the golden rule by it; but there's no theory too absurd to find advocates where self-love is concerned."

HOW TO CONVINCE:

OR, HAMMERING IN AND HAMMERING OUT.

"Excuse me, sir," said the Nail to the Hammer, "but one or two decided blows in the right direction would knock me *in*; whereas those you are giving me, first on one side and then on the other, will in all probability end in knocking me out."

CAUGHT AND TAUGHT.

"Pooh! who cares for that?" cried the Blue-bottle, bursting through the spider's web in the pride of his strength, as he began his day's sport.

The Spider waited in the dark till he had passed, then went to work to mend her web.

"What! ready for a catch again?" cried the Blue-bottle, returning at noon rather wearied with the frolics and excesses of the morning. Twice he struck the web before he passed through it, carrying some of it on his wings.

The Spider half showed herself, but ran back as he escaped, and, when he had gone, once more span away to repair her web.

"Ha, ha, ha!" cried the Blue-bottle, languidly, as he was going home in the sunset, quite worn out with his day's delights. "I'm sorry to disturb you, old lady, but, if you will hang your house in the Queen's highway, there's nothing for it but to go through it."

He threw himself against the filmy snare, but he was not able to break it. He affected to scorn it. "I won't trouble myself with it now," he cried, and thought to leave it; but the subtle threads had closed round his feeble limbs, and he could not withdraw them.

"Sorry to disturb you, sir," said the Spider, coming out of her corner, "but, if you *will* make free with people's houses, you must expect to pay for the liberty."

In meeting her attack the unhappy Blue-bottle struggled so violently that he broke the web, and fell fainting below. "Ah!" he cried, as he crawled away, sick and wounded, "I see now none but the fool-hardy will trust themselves in the most contemptible snare when they are not prepared for it; that which I laughed at in my strength had nearly proved my destruction in the hour of my weakness."

NEVER FEAR! THINGS WILL RIGHT THEMSELVES.

"Isn't it awful!" said the Poker.

"It makes my legs shake!" said the Tongs.

"It quite unfits me for my duties; I am not equal to a single scrape," said the Shovel.

"What's the matter?" asked the Fender.

"The pot, sir—the pot; don't you hear the fuss it's making? And just look at the lid, how it wobbles up and down!" they answered, in a breath.

"All right; let it fuss and wobble till it's tired," said the Fender.

"But it will boil over—it will indeed!" they cried, in great agitation.

"Well," said the Fender, "let it boil over: it will get rid of the *scum* that way, and the wholesome part will boil on peaceably enough when it's left to itself."

WHAT KINDNESS WILL DO.

How the wheels of the old cart creaked! The Road was quite tired of hearing their complaints, when lo! suddenly they became quiet, and went smoothly on, making no doleful sound.

"How now!" cried the Road; "what has happened that you take things so easily to-day? Has the master taken off half your load?"

"No," said the Wheels; "he hasn't done that; our burthen is, if anything, heavier than before; but *this* he has done, he has oiled us, so that whatever we may have to bear we have no longer the heart to say a word against it."

MISCHIEF-MAKERS.

"NOVEMBER says it's all stuff about sunshine," said May, laughing; "he never saw any."

"November is an ungrateful fellow," said the Sun, angrily; "I shine as brightly on him as on you; but *he won't* be the better for me."

"Ah! sir," pleaded a Beam, that had tried vainly to pierce through the smoky, drizzly mist, "I assure you it is not his fault; he sees you only through that pernicious *fog* that hangs over him, and so beclouds and misrepresents you, that you are as entirely shorn of your glory as he is of his comfort. Keep me from your mischief-making go-betweens!"

ENTIRELY AS YOU VIEW IT.

"How unutterably odious!" muttered an elegant Italian Greyhound, as he stopped for a second on his way through the yard to look at a huge Sow wallowing in the mire, with her litter of little ones. "Poor miserable creature—*so hideous!* Surely that alone would render life intolerable; but to be for ever in this poisonous atmosphere, and condemned to swallow that hateful *wash*. Oh! I am sorry for the brute!" and he passed on quickly, disgust strongly expressed in his looks.

"Mammy," squeaked a little Pig that had climbed up the old sow's back to get a good sight of him, "who is that

gentleman? How thin he is! and he looked so sick. Who is he?"

The old Sow opened her red eyes as wide as she could, and squinted at the Greyhound as he vanished in the distance; then, shutting them again, answered—

"It's the Greyhound, children. Poor fellow! he is thin, indeed. No wonder; for, instead of leading a life of luxury such as ours—lying asleep in this nice soft mess all day, with nothing to do but to feast on our wash and rotten potatoes, unless we like to go and scratch ourselves on the stone, he has to scour the country from morning till night, and gets very little to eat for his labour, judging by his lanky body. No wonder he looked sick. I dare say he was envying us, and longing for some wash. I'm sorry for him, but we can't *all* be pigs!"

SOON HIGH, SOON LOW!

"MOTHER," said a little Daisy, which had lost sight of the sun under the shadow of a huge mushroom; "isn't it unbearable! Here we, who have been patiently growing and putting forth bud after bud and leaf after leaf, from the very dawn of spring, and have gradually increased to a very decent family, through summer and the opening of autumn, suddenly *buried, eclipsed, lost*, under the shade of this monstrous creature, the growth of a day or two!"

"Never mind, child," said the Parent Plant; "my experience of those things is, that they perish as quickly as they rise; we advance slowly but surely, and strengthen as we grow; the very rapidity with which a mushroom runs up carries in it the sentence of a brief existence. Be patient; it will soon vanish, and we shall see the sun again."

MORALISING COMFORTABLY.

"PATIENCE, brothers, patience!" said an Ox, standing by while his companions were yoked for the plough. "Patience is a fine thing for us all."

"Yes," replied one, "you see the advantage of it for us to-day. It's a pity you didn't duly appreciate its value yesterday, when you were grumbling and fretting beneath the yoke yourself."

THE WISDOM OF THE AGED.

The new Wine rioted in the cask; its vigour, its spirit were unbounded. It was luscious to the taste, it was fire in the veins, it made the brain dizzy. "What mighty power is mine!" it cried.

Years passed; it no longer threatened to burst the vessel that held it. It lay still and clear; the dregs had sunk, and fermentation had long passed.

"True," it exclaimed, "I am less pleasing to the palate; I cannot, if but duly used, rouse to madness or sink in stupefaction, as I once could; but I can now impart generous warmth, I can strengthen the feeble, I can cheer the sinking; truly it is *now* that I have power worthy of rejoicing in."

FORCE OF CONTRAST.

"How muddy the water is!" said some little Fish.

"Most disagreeable!" said some others. "How can you look so happy in it, wriggling about?" they all cried to some Eels that were disporting themselves with great satisfaction.

"Friends," replied the Eels, "*you* call the water muddy, but we have just come from the bottom, *where there is nothing but mud*; therefore to us it seems to be quite clear."

THE MOST DANGEROUS ENEMY IS OFTEN THE LEAST TERRIBLE IN OUTWARD SHOW.

BANG! bang! bang!—bounce! bang!

"Oh, dear friends, whatever you do, keep out of the way of that gun; it blazes and bangs and bounces continually," cried a Wild Duck to his companions in the brake.

"That's not the gun to be afraid of," said another. "It does, indeed, blaze continually, but always at random, therefore does little harm to anything but the reeds or bushes. I'll tell you what gun to avoid—that one that is now pointed; it goes off seldom compared with the other, but it never fails to bring down its bird when it does."

THE LEISURE HOUR.

A COLD NIGHT FOR TRAVELLING BY COACH.

THE MORTONS OF MORTON HALL.

CHAPTER IV.—SOME ACCOUNT OF THE RECTOR OF ST. DAVIDS, AND HIS FRIENDS.

THE Reverend Archibald Sinclair, rector of the parish of St. Davids, county Cornwall, was a gentleman of ancient and honourable lineage, and the possessor of an ample independent fortune. At the date to which this history refers he had almost completed his sixtieth year, and had been rector of St. Davids nearly twenty years; but, in his early life, and in fact until he had attained to what may be termed middle age, he had served in the army, both in Great Britain and in the colonies, and had at

one time held a staff appointment in India, in the suite of the then Governor-General, his cousin. He had retired from the service with the rank of major, and with the express purpose of entering the Church, having been actuated in making this singular change of profession by purely conscientious motives, and in the belief that, as a minister of the Church of England, he could exercise a more beneficial influence over his fellow-creatures, and also employ his ample means to better advantage, than was possible in any other sphere of usefulness. Having once decided upon this step, and having devoted a certain period to the requisite studies to qualify himself

for his new profession, he was duly ordained, and, after occupying for a few months the position of curate, he found little difficulty in obtaining a presentation to one of the numerous "livings" in the gift of his aristocratic relatives and friends. In fact, he had the offer, or rather, I should say, the choice, of several valuable livings in the vicinity of the metropolis, and in the more desirable localities in the provinces; but he preferred to accept one of the poorest and apparently least desirable of these livings, of small emolument and arduous duties—to wit, the rectorship of the extensive and widely-scattered parish of St. Davids, on the coast of Cornwall, the population of which consisted almost entirely of poor fishermen and agricultural labourers, for whose spiritual and temporal welfare he hoped to carry into effect the philanthropic plans he had conceived.

As I have said, at the date at which this story opens, Mr. Sinclair had been rector of St. Davids nearly twenty years, and had throughout that period devoted not only the whole emoluments of his living, but likewise a very considerable portion of his private income, to purposes of benevolence for the benefit of his parish and people.

Naturally of a sanguine temperament and of generous disposition, he had conceived a variety of projects for the advantage and improvement of his humble parishioners, which a few years' experience as a country clergyman had convinced him were romantic and visionary, and too Utopian in their character to be realised, as he had once anticipated: nevertheless, he had not been daunted in his philanthropic endeavours; he had established schools, loan societies, savings banks, and other institutions for his people's benefit, and had succeeded, at least to a certain extent, in his benevolent objects, and had acquired the respect and esteem of those to whose welfare his labours were devoted.

With his change of profession, however, Mr. Sinclair had been unable, or perhaps had not held it essential, to cast aside many of the military habits he had formed in youth and early manhood, and, whether on horseback or on foot, he presented on ordinary occasions, in his gait and bearing, the appearance rather of a soldier than a clergyman.

His iron-gray hair and whiskers were cut close, and worn *à la militaire*, and his tall, erect figure and stately step aided in imparting to him a soldier-like aspect. On the Sabbath day, however, he presented a different appearance. The white surplice and the black gown were alike admirably adapted to set off to advantage his tall slender form, and thin pale face, and benevolent features; and, as he passed up the aisle of his little church, with slow and measured step, to the reading-desk or pulpit, he appeared a chief among men and the *beau idéal* of a clergyman; and, though he possessed no special gift of oratory, the persuasive earnestness of his voice, as in plain, clear, almost homely language, well suited to their comprehension, he addressed his lowly yet attentive congregation, thrilled to the very hearts of the listeners.

Mr. Sinclair had never been married, and his niece, Miss Wardour, presided at the rectory.

The feminine portion of his parishioners held to the belief that the death, in early youth, of a young and amiable lady to whom he was devotedly attached, and who, had she lived, would have become his wife, was the cause of his passing through life unmarried, and had also had some influence in bringing about the remarkable change in his career.

Women, whatever be their rank or condition in life, are prone to adopt romantic theories to account for cir-

cumstances of this nature; nevertheless it *may* have been that the wives and daughters of the humble fisher and farming men of St. Davids had some reason beyond mere fancy for their surmises. Whether they had or no it is not essential to this history for the writer to disclose.

"Doctor" Pendriggen—as he was styled by courtesy, though he neither had nor laid claim to the diploma of an M.D.—had served for many years as an assistant-surgeon in the royal navy, and was thus well adapted by his previous habits, and by long experience in treating the diseases incidental to seamen, to his position as parish surgeon in a community the great majority of whom were fishermen and their families. Beneath a somewhat rugged exterior, the doctor concealed a kindly, benevolent heart; and, notwithstanding an occasional roughness of speech, he was a man of much natural intelligence, of considerable scholastic attainments, and of no small professional skill.

With the rector, although no two men could have differed more widely in many respects, Doctor Pendriggen was on terms of the most intimate and familiar friendship. Both were alike active in deeds of benevolence and charity, although the doctor's limited means confined his charities chiefly to gratuitous visits and free gifts of medicine to his poorer patients; and, though this practice kept him poor, he was wont to say jocosely that people seldom came to seek *his* assistance under false pretences. Still, as the poor were numerous in the parish, the worthy doctor's charities were by no means trifling in value, and he was almost as much respected and esteemed as the rector himself.

Au reste, Doctor Pendriggen was a widower, and was, at the date to which my story refers, about forty-five years of age.

The Reverend Alfred Sharpe was a young man of two or three and twenty, just fresh from Oxford, and of respectable though not wealthy parentage. He was tall and thin, with fair complexion, light hair and light blue eyes, and, being somewhat near-sighted, he habitually wore spectacles, and—a frequent habit with near-sighted persons—bent his head slightly forward as he walked. He was of somewhat nervous temperament, and shy and retiring in disposition, and was reported to have been addicted, while at Oxford, to severe study. As, however, he had been but recently ordained, and was consequently a new-comer to St. Davids, I shall leave his character to develop itself as I proceed with my story.

CHAPTER V.—THE SHIPWRECKED PASSENGER OF THE AMERICAN PACKET-SHIP POWHATTAN.

MR. ASTON, the shipwrecked passenger of the American packet-ship Powhattan, who had become the guest of the worthy rector of St. Davids, was, as he informed his hospitable host, an Englishman by birth, though he had quitted his native land in his early youth, and had for many years wandered about in different parts of the world, until at length, some twenty-two years prior to the date at which my story opens, he had married and settled down in the far-west of America, where he had acquired great wealth.

He was now a widower, and out of a large family of children, the elder two, a son and daughter, alone remained to him, and these he had left behind him in America.

But, though so far communicative, Mr. Aston was strangely reticent respecting his early life in England, and respecting the nature of the business which, after so many years' absence, had induced him to return to his native land.

A sprained ankle, which, though very painful and swollen, had at first seemed but a trifling injury, in comparison with what might have befallen a shipwrecked man of his years, was, however, a more serious matter than even Doctor Pendriggen had suspected. A lameness resulted from it which prevented him from putting his foot to the floor for many weeks, and which at one time threatened more serious consequences. He was kept a close prisoner to the house during this period; and, in fact, was for a great portion of the time confined to his room; for he had likewise received some internal injuries which, though apparently not of a very serious nature, and not even suspected until some days after the shipwreck, were rendered more distressing to himself, and more difficult to treat, in consequence of his natural irritability, and his anxiety to get away from St. Davids.

Thus it happened that the month of February was well advanced before he was sufficiently convalescent to take his departure; and meanwhile he had become very intimate and friendly with Mr. Sinclair and Miss Wardour, both of whom, when he more than once expressed his desire to return to his humble quarters at the "Fisherman's Arms"—feeling, as he averred, that he was unduly taxing their kindness and hospitality—refused to listen to any proposition of the kind, and insisted that he should continue to remain their guest.

In truth, setting aside a few harmless eccentricities, the rector and his niece found Mr. Aston a very agreeable and intelligent man. He had, as he had said, travelled far and wide before he had settled down in the far-west of America, and had been in India at the same time as had the rector himself; and thus the two gentlemen found much pleasure in sitting and chatting together about old times and distant lands, during the long winter evenings. Mr. Sinclair frequently felt the solitude of his position, and was glad to see the face of a stranger in his remote country parish; while Miss Wardour—a young lady of twenty-four years—listened with delight to the conversation of her uncle and his guest as she sat at her needlework or embroidery, and occasionally modestly took part therein.

Mr. Aston also got to be on very friendly terms with Doctor Pendriggen, and Mr. Sharpe, and one or two other gentlemen who resided at a distance, but were occasional visitors at the rectory; and, when at length he was able to take short walks abroad, he made better acquaintance with Jemmy Tapley, the old wooden-legged mariner, and with others of the humbler inhabitants of the village, to whom, under Providence, he owed his life, though they refused to accept any reward for the courage and humanity they had displayed on the night of the shipwreck.

When, therefore, he was ready to depart for London, he set forth amidst the regrets and good wishes of the numerous friends he had found on the shore upon which he had been so unexpectedly and unpleasantly cast; while he, on his part, had conceived so great an attachment to the village and its people, that he vaguely hinted his intention, should he decide to remain in England, to purchase property in the parish or its vicinity, and settle himself there for the remainder of his life.

Still, notwithstanding his intimacy with the rector and others, and the freedom with which he had conversed on almost every other topic, Mr. Aston had preserved his original reticency respecting his early life in England, and had never spoken of the object of his visit to his native land, after an absence of nearly forty years.

Once or twice, when in familiar conversation with Mr. Sinclair, he had appeared as if he were inclined to be more communicative; but, on these occasions, he had, as it were, suddenly caught himself up, and had endeavoured to change the topic of discourse.

During his long detention at St. Davids, he had written to no one in England except a banker in London, nor had he received letters from any other person. The banker's letters chiefly related to the re-investment of large sums of money that he (Mr. Aston) had at different times invested in the English funds, and these letters he had read aloud, and sometimes shown to the rector, in order that he might have his advice in the matter.

Thus Mr. Sinclair and his friends were satisfied that the stranger who had been thrown amongst them was really, as he had said, the possessor of considerable wealth; and this knowledge is with many people quite a sufficient, and indeed the very best, guarantee of respectability, while there are none with whom it does not possess some weight. But they knew nothing more respecting him.

And even now, when Mr. Aston was on the point of departure, he made no mention whither he was going after he should leave London (where he intended to make but a few days' sojourn), though he promised to write to Mr. Sinclair from time to time, and, at all events, to visit St. Davids again, whether he should make up his mind to remain in England or to return to America.

This singular secrecy respecting matters that evidently occupied his thoughts continually, and occasioned him much anxiety, would have led many people to regard him with suspicion. Such, however, was not the case with the rector and his friends. They believed that he was actuated by eccentricity. In his honesty and integrity they had implicit confidence, and were satisfied that some day, when it suited him, he would explain all that now appeared mysterious in his conduct.

With this good feeling on both sides, Mr. Aston and his friends parted. Mr. Sinclair accompanied his late guest to Falmouth, where the latter took an inside seat in the mail-stage, and, at the end of two days' journey, arrived safely in London.

CHAPTER VI.—A STRANGER ARRIVES AT THE "WHEATSHEAF" INN AT FORDHAM.

THE little secluded village or hamlet of Fordham stands near the great north road (which runs through several of the midland counties of England), and within a hundred miles of the great metropolis; and fifty years ago the "Wheatsheaf" inn stood fronting the road, and within a few yards of the lane that leads to the village. It is now no more, for wayside inns have well-nigh disappeared, together with many other memories of the "good old times," upon which, despite the boasted rapid march of progress and civilisation, we are still apt to look back with regret.

One evening in the month of February, just one week from the day on which the shipwrecked passenger of the Powhattan quitted the village of St. Davids, the mail-coach from London drew up to change horses opposite the "Wheatsheaf" inn ere it proceeded on the last stage of that day's journey. The day had been wintry and gloomy, and darkness had set in early; snow lay deep on the ground, and the mail had, in consequence, been detained two hours behind its time. The coach was full of passengers, outside and inside; nevertheless the landlord of the inn looked ruefully at his well-garnished table, for well he knew that, in consequence of the

delay, the passengers had dined at the inn at which the stage had changed horses two hours before.

"No passengers 'll light here at this time of night," he remarked to the head-waiter. "They'll have dined at the 'Plough,' I'll warrant. Show a light, Bill; but 't won't be o' no use."

"A passenger for the 'Wheatsheaf!'" bawled out the guard, interrupting the landlord's doleful monologue. "Inside passenger," he went on. "Stops for the night. Come, look out here arter the genelman's luggage."

"Rum start this, Bôb" (this aside to the coachman), "to put up *here* for the night, when the very next stage takes us on to the town."

Having thus delivered himself, the guard swung himself from the basket of the coach to the ground, where he stood flinging his arms to and fro to restore the circulation to his half-frozen limbs, while the passenger, who had alighted, pointed out his luggage to the porters.

Then, ceasing his violent exercise, the guard touched his hat, and addressing the passenger, said—

"This way, sir, please. Fust-rate inn, the 'Wheatsheaf.' Foller me, sir;" and led the way towards the porch, where the landlord, who by this time had come forth, stood to welcome his unlooked-for guest.

"Please to remember the guard, sir." Again the guard touched his hat.

"Thank'ee, sir. A drop o' summat warm 'll do a body no harm, for it be a bitter cold night as ever I saw. Luggage all right, sir? That's well;" and, pocketing the silver coin the passenger had handed to him, the guard entered the bar-room of the inn to partake of "refreshment," in the form of hot brandy-and-water, while the fresh horses were being put to the coach.

None of the other passengers seemed inclined to alight, nor even to remove their wrappers and brave the frosty air for the sake of the refreshment the landlord would gladly have sent out to them, and in a few minutes everything was prepared for a fresh start; not, however, till the guard came forth from the inn with a tumbler of hot liquor, which he handed to the coachman on the box.

"All right!" cried the guard, as he climbed to his seat in the rear of the vehicle. The coachman smacked his whip, and the coach started anew with its fresh relay of horses.

The guard tried a note or two on the key-bugle, but finding the weather too cold to permit him to blow the instrument with comfort, he soon laid it aside, and nothing was heard but the tramp of the horses' hoofs, and the rattling of the wheels as they rolled over the frozen ground.

Meanwhile the departing passengers, recollecting that they had yet a long cold ride before them, thought of their late companion with feelings akin to envy, as through the frosted window-panes of the inn they were leaving behind them, red with the glow of the blazing fires within, they caught glimpses of brilliantly-lighted and well-furnished parlours, and of a well-spread table in the dining-room, promising alike warmth, comfort, and good cheer—all very excellent things to meet with at the end of a long winter day's journey. But the coach sped rapidly onwards; the brilliantly-lighted inn was soon lost to view; and again they plunged into the dreary darkness of the night, only relieved by the cheerless glare of the snow that covered the road and the surrounding country, and clung to the branches of the leafless trees.

The landlord had, meanwhile, ostentatiously welcomed his unlooked-for guest, though he could scarcely restrain

his astonishment that a gentleman, travelling by stage, should put up for the night at a way-side inn, when the stage had nearly completed its journey. Had the traveller arrived in a post-chaise it would have been a different affair, and a not unfrequent occurrence; but stage-coach travellers generally made the through journey, unless they came to visit friends in the neighbouring village, in which case they usually proceeded to the residence of their friends immediately after they had partaken of some slight refreshment.

The new arrival, however, had evidently no thought of leaving the inn that night, though the village was so near. He ordered supper to be served, and a bedroom to be prepared for his reception as soon as possible, observing, at the same time, that he was very tired after his long day's journey.

"Come all the way from London, sir?" said the landlord, interrogatively.

"Yes, from London," replied the traveller.

"Going on farther to-morrow, sir, I suppose?"

"No; I am going no farther."

"Ah, I see, sir; got friends living in the village, or near by?"

"Perhaps so; perhaps not."

"Stay at the 'Wheatsheaf,' sir? Make you very comfortable."

"Perhaps so; possibly I may return to London to-morrow. Let me have supper."

The tone in which the traveller spoke the last words showed that he did not wish to be further questioned, and the disappointed landlord, who wanted to find out whether his guest had come down on a visit to any of the gentlemen's seats in the neighbourhood—for his appearance precluded the idea that he had come to visit any of the village folk—quitted the room discomfited.

Still curious to learn who the stranger really was, the landlord waited himself at the supper-table, but the traveller gave no further information respecting the object of his visit; and, as soon as he had finished his supper, desired to be conducted to his bedroom.

The chambermaid was promptly in attendance with a candlestick, and the stranger followed her upstairs, but stopped at the first landing and, looking down, inquired whether his luggage had been taken up to his room.

"Not yet, sir," replied the landlord; "I will send it up by the porter immediately."

"Very good," replied the stranger. "Let me be called at eight o'clock in the morning, and have breakfast ready when I come down-stairs."

"Yes, sir," responded the landlord.

The stranger was going on, when a sudden thought appeared to strike him.

"By the way, landlord," he said, "you know Morton Hall, near by, at the other end of the village? Of course you do."

"The squire's place, sir? Yes, sir."

"Are the family all well?"

"To the best of my knowledge, sir. I've heard nothing to the contrary."

"And at home?"

"I b'lieve they be, sir. I did hear last week from Mr. Tomlins, the butler, as they were a-going up to London soon; but unless they started afore the snow-storm came on this morning—which ain't likely—they beant' gone yet."

"Thank you," replied the stranger, and passed on to his bedroom.

Presently the porter appeared with the luggage that had been sent for.

"Wait one moment, Tom," said the landlord; "what's the name on the card fastened to the portmanteau? Ah, I see: 'Mr. H. Aston, London to Fordham.' Go on, Tom."

"Aston!" repeated the landlord, as the porter passed on with his burden. "Aston—from London to Fordham—hem! Must be some visitor to the squire's by his asking so purtic'lar about the 'Mortons;' but I don't recollect any such name ever visiting at the Hall before. Well, I s'pose we shall know all about it by'm by; but I seldom seen a gentleman have so little to say for himself."

They kept early hours at the "Wheatsheaf." The last night-coach had changed horses and gone on its way. Soon after the traveller retired the shutters were closed, and long before midnight all the inmates of the house had retired to their beds.

READY-MONEY HOUSEKEEPING.

THE praiseworthy endeavour "to make both ends meet"—an endeavour which ought never to relax, inasmuch as one's comfort and respectability depend on its success—is often defeated by the practice of taking needless credit; that is, by running into debt for things which should be and might be paid for with ready cash. At the risk of being suspected of poaching on the manor of Poor Richard, and warming up an old dish, we shall devote a column or two to the inculcation of ready-money dealing, viewing the subject in the light of to-day, in the hope that our desultory remarks may prove of use to housekeepers, and to young housekeepers more especially, who in the present day, when credit is so general and so easily obtained, are too apt to be led into difficulty by its delusive fascinations.

First of all, let us jot down a few remarks, the results of a long and varied experience, on the advantages of "cash down." To start with, we may point to the fact, not at all a trifle in itself, that he who goes into the market with money in his pocket, prepared to pay for what he buys, is master of the whole market, can deal where he likes, and with whom he likes. If one dealer's goods are not to his taste, he can have recourse to another; and, in fact, to the extent of his purchasing power, is master of them all. Consequently, he can use his own judgment in the selection of the wares he wants, and need not be put off with inferior ones. He is under no obligation to the seller, but can assert his independence, and bargain with him on equal terms, while his very independence will secure for him a greater degree of civility and attention than he would dare to expect were he deep in the seller's books. In the next place, the man or the woman who deals for cash only, and runs up no accounts, avoids the risk of paying twice over for anything. This may seem at first view of comparatively small importance, but in truth it is not so. Demands are constantly being made for such second payments—not so much, it may be charitably inferred, from the dishonesty of tradesmen and shopkeepers, as from their carelessness. In the bustle of business over the counter, they neglect to cross off small sums received, and forget all about it afterwards. Their memories are more tenacious of debts incurred than of accounts settled; and, if they have any doubt as to whether a "little bill" is settled or not, it is scarcely to be wondered at that they should give themselves the benefit of it. Shopkeepers, though perfectly honest, often fall into errors of this kind, and sometimes damage themselves seriously by their laxity; while, on the other hand, there is little

doubt that careless or unsuspecting customers who take credit are frequently victimised from the same cause.

Again, the ready-money purchaser escapes the risk, all too common, of paying for goods and consumable wares which he has never had. There are plenty of dishonest shopkeepers, ever ready to take advantage of a customer's indifference and carelessness. Some of them are so well skilled in the art and mystery of overcharging, that they even prefer doing business on credit to doing it for ready cash, because the credit system gives them the opportunity they want—provided always that the customers they trust are in respectable circumstances. Dr. Trusler, in his "Domestic Management," gives a rather flagrant instance of the effrontery of persons of this class. A gentleman was one day complaining to his butcher, with whom he had dealt with ready cash for a year or two, of the quality of the meat he was sending in.

"I don't value your custom a straw," retorted the burly trader: "You may carry it elsewhere if you like. You never run up a bill."

"What did he mean," asks the doctor, "but that the gentleman never gave him the opportunity of charging for a joint which had not been sent in?"

A further advantage enjoyed by the ready-money dealer, lies in the fact that he can economise his means. He is not likely to buy too much of a thing he wants, or anything he does not want, because the penalty of paying for it is always at hand, and not put off for a future day. Credit, as everybody knows, is the parent of extravagance. Cash down, we may add, is the best of all checks to any tendencies in that direction, and the best security for prudence and thrift. He or she who accepts general credit must be often in doubt as to the actual state of the domestic finances, and is liable to grievous discoveries at those critical periods when the debits and credits have to be balanced and scores wiped off. With those who pay cash the case is different. They can always tell the state of the exchequer by referring to the balance in hand, which they have the pleasure of knowing is their own and not another's.

The last advantage we shall notice here, though many others suggest themselves, lies in the satisfaction a man must feel in the consciousness that, whatever else there may be to plague him, his money-matters are all right and square. This satisfaction belongs peculiarly to the class who, turning away from the allurements of credit, pay their way as they go. The ready-money man, albeit his means are limited and confined to the earnings of his own hands or brain, is more free and independent, and is so far more happy and comfortable, than any man can be who is loaded with the obligations of debt. In his walks abroad he is never afraid of meeting a creditor; he need not take circuitous routes to avoid the shops of suspicious or suffering tradesmen; and is never put to dismay by certain oblong slips of paper bearing her Majesty's name, in the hands of those ominous-looking myrmidons who affect the dusky splendours of velvet and corduroy. At home he can enjoy the welcome tranquillity of his fireside. Whatever knocks, single or double, come to his street door, he can listen to them unperturbed, or can answer them himself without a thought of misgiving or the apprehension of a dun. Like Longfellow's Village Blacksmith, "he looks the whole world in the face, for he owes not any man;" and so no man has the power to put him out of countenance by a demand which he is unprepared to meet.

The disadvantages of taking credit are even more obvious than are the advantages of the cash-down system. If you go into debt for necessities you limit your market

to the narrowest bounds, and often shut yourself out of the benefit of declining prices, seeing that without money in hand you must deal with the traders who are willing to trust you, and must have their goods at their own price, or go without them. To a poor man with a scanty and hardly-earned income this is a serious consideration indeed, and in practice often proves fatal to the health and comfort of his family. It is in the "general shops" of the courts and back streets, where everything that the working man's family wants is sold, and where everything is sold on credit, that the very worst provisions and household materials of all kinds are found in the greatest abundance. This is the market for the tea of home manufacture—tea that is made up of a mixture of dried tea-leaves and leaves of the sloe; for coffee which has lain for long in the show-windows of the regular grocers, where it has parted with all its native flavour; for sugar that will not sweeten, but will deposit a nauseous refuse of slimy sand; for dried fruits in which decomposition has already set in; for bread in which flour can hardly be said to be the prevailing ingredient; and for fifty other things of as vile a description made to sell upon credit to the poor man, and which in a ready-money market would never command a sale at all. To this market the working man who takes credit is ultimately driven, because the more respectable shops will not give credit to men of his class; and it shall happen that from this cause alone his own health and that of his family are undermined.

Again, it is well known that by some means or other—what are the means the traders know best—wherever credit is given, those who ultimately pay are made to pay not only their own quotas but those of the defaulters as well. We forbear to inquire whether this is done by the adulteration or sophistication of goods, or by some more recondite process—we mention it only for the sake of reminding the debtor of the contingencies to which he is liable, and which he may avoid by paying ready cash. Theodore Hook tells a story of a shopkeeper who used to solace himself on wet and stormy days, when no customers came to his counter, by taking down his account-books and going through them pen in hand, interpolating entries and setting down imaginary transactions wherever he could find room for them, and could persuade himself they would pass unchallenged. We should be sorry to think there were many such knaves as this fellow to be found behind the counter; at the same time the trader is always subject to a temptation to take advantage of the neglect of a careless customer who trusts himself entirely in his hands. We have before now seen some astounding bills sent by tradesmen when accounts have been suffered to stand over for a long time—bills which seemed to prove, as far as figures are proof, that the ordinary consumption of a family may become double on occasions without any appreciable cause. It is of no use to grumble at such accounts, or to resist the payment of them; the trader who makes a false entry will boldly stand up for it; and if you refer the matter to the decision of a court of justice the jury will accept the evidence of his books unless you can produce some proof of fraud, which it would be quite impossible to do in such a case.

It is not at all a difficult thing to set out in life on the ready-money system, seeing that when we are young and have our way to make, it is generally forced upon us: the difficulty is rather to resist the seductions of credit when the sun of prosperity has begun to smile on us, or, which is pretty much the same thing, when people think it has. The best preservative against the

temptation to run into debt is the practice of self-denial. Make up your mind early in life to purchase nothing that you can well do without until you can not merely afford to buy it but have the money in hand to pay for it. Let this be your golden rule, and act upon it continually from year to year. If you are single, do not even take a wife on credit—that is, do not think of marrying until you can begin housekeeping on the ready-money system. If you once start upon credit you are in a fair way to go on so to the end, and if you do that you will never enjoy the satisfactions of real freedom and independence, and further, will never, as we have shown above, reap the full benefit of your income, be it large or small.

Let us counsel those among our readers with whom economy and the thrifty investment of their finances is an object of importance—if they have been in the habit of taking credit hitherto—to make a stand against the practice from this time forward, and to persevere until their names have altogether disappeared from the shopkeeper's books. The thing is difficult in some cases, it must be confessed, but it is not impossible, and may be done by perseverance in a little self-denial. In the case of a working-man paid by weekly wages, the method is simple enough. Let him give up some small indulgences, or even necessities, for a time, and lay by their cost until the savings have grown to the amount of his weekly wage. Such saving will be a good discipline in itself, and the ready cash thus gained will enable him to drop his dealings on credit, and start as a ready-money man. Clerks and managers who are paid quarterly will find it a harder matter to get clear of credit after being long accustomed to it; but, if they cannot do it at once, they can yet do it, as we have seen it done, by degrees. The same self-denial that helps the artisan will help them, and the practice of it will enable them to transfer one item of housekeeping stores after another from the credit to the ready-money system, until the whole of the domestic outlay is so transferred, and the reform is complete. The result will be, on an average, that persons of their grade, thus emancipating themselves from the predicaments of constant debt, will add practically some twenty per cent. to the purchasing power of their incomes—to make no mention of the superiority of the goods purchaseable for cash over those which are systematically thrust upon the humbler classes who buy on credit.

Meanwhile, so long as credit *must* be had, let the buyer remember that the shorter he makes his credit the better, as a rule, the shopkeeper will serve him. And let him keep a check against his tradesmen, or rather let him make them keep it, by entering in the buyer's book, as well as in their own, every article they sell him.

THOMAS CARLYLE.

THOMAS CARLYLE was born at a farm-house in Middlebie parish, near Ecclefechan, in Dumfriesshire, on the 4th of December, 1795. His father was a true specimen of the better class of Scottish yeomen in Annandale—a man of shrewdness and energy, and with religion of the old Presbyterian type. His mother was a woman of superior intelligence, kind-hearted and pious; so that his home was like that described by Burns in his "Cottar's Saturday Night." In the parish school, in those days, the children of all sects met on common ground; and here the boy got his first lessons, till old enough to be sent to the Grammar School of the town of Annan. The highest ambition of many a humble

mother in Scotland is "to see her son's head wag in a pulpit;" but this desire in Carlyle's parents was prompted by the noblest motives, as might be expected from their devout character. His training at the Grammar School was intended to prepare him for the University, where all candidates for the ministry in Scotland have to pass through a three or four years' curriculum of study, before commencing the special classes for theology.

In his last year at Annan, in the summer of 1809, when in his fourteenth year, Carlyle first became acquainted with Edward Irving. Long after, in 1835, he described the impression which Irving, his senior by one or two years, made upon him on his first return from Edinburgh College. "The first time I saw Irving was six-and-twenty years ago, in his native town, Annan. He was fresh from Edinburgh, with college prizes, high character, and promise. He had come to see our school-master, who had also been his. We heard of famed professors, of high matters, classical, mathematical, a whole wonderland of knowledge. Nothing but joy, health, hopefulness without end, looked out from the blooming young man." This passage is doubly interesting when read along with another and more personal fragment of autobiography, part of the address at his inauguration as Rector of Edinburgh University, on the 2nd of April, 1866: "There are now fifty-six years gone, last November, since I first entered your city, a boy of not quite fourteen—fifty-six years ago—to attend classes here and gain knowledge of all kinds, I knew not what, with feelings of wonder and awe-struck expectation; and now, after a long, long course, this is what we have come to. There is something touching and tragic, and yet at the same time beautiful, to see the third generation, as it were, of my dear old native land rising up and saying, 'Well, you are not altogether an unworthy labourer in the vineyard; you have toiled through a variety of fortunes and have had many judges.' As the old proverb says, 'He that builds by the wayside has many masters.' We must expect a variety of judges, but the voice of young Scotland, through you, is of some value to me, and I return you many thanks for it, though I cannot describe my emotions to you, and, perhaps, they will be much more conceivable if expressed in silence."

Of his college career, the only memorable point in written record is that he studied mathematics with great success, and obtained the notice and friendship of Professor Sir John Leslie. If, as is usually supposed, he narrates his own experience, in the person of Herr Teufelsdröckh, in his "Sartor Resartus," his life at Edinburgh did not fulfil the early dream of "a whole wonderland of knowledge." "What vain jargon of controversial metaphysics, etymology, and mechanical manipulation, falsely named science, was current there, I indeed learned better, perhaps, than the most. Among eleven hundred Christian youths, there will not be wanting some eleven eager to learn. By collision with such, a certain warmth, a certain polish was communicated. By instinct and happy accident I took less to rioting than to thinking and reading, which latter also I was free to do. Nay, from the chaos of that library, I succeeded in fishing up more books than had been known to the very keepers thereof. The foundation of a literary life was hereby laid. I learned, on my own strength, to read fluently in almost all cultivated languages, on almost all subjects and sciences."

For a time Carlyle continued the studies required for entering the Church, but it is evident that "the foundation of a literary life" was already laid. The irregular appetite for books "in almost all languages, and on almost

all subjects and sciences," including modern German philosophy and romance, could hardly co-exist with the earnest study of theology. For the Christian ministry, notwithstanding the pious wishes of his good parents, he felt he had no special calling; and it would be well if many others were equally honest in judging their own qualifications for so sacred a vocation.

On relinquishing his purpose of entering the Church, Mr. Carlyle supported himself for some years by teaching mathematics; and, in 1823, became tutor to Mr. Charles Buller.* At this time he wrote his "Life of Schiller," which was published in three portions in the "London Magazine," in 1823 and 1824. Already he had contributed some articles to the "Edinburgh Encyclopædia," edited by Sir David Brewster, and to the short-lived "New Edinburgh Review." He had also published a translation of Goethe's "Wilhelm Meister," and of "Legendre's Geometry," to which he prefixed an "Essay on Proportion."

The translation of "Wilhelm Meister" appeared anonymously. The "Monthly Magazine" spoke of the translation as "executed in a masterly way;" and "Blackwood" said "Goethe, for once, has no reason to complain of his translator," who was congratulated on his promising *début*, and encouraged to produce other similar works. This was done in four volumes of "Specimens of German Romance," one of which was a version of Wilhelm Meister's "Wanderjahre," a sequel to the "Lehrjahre," or Apprenticeship. The other three volumes contained selections from Richter, Hoffmann, and other German romancers.

The translation of "Wilhelm Meister" was made the occasion of a slashing attack by Jeffrey, in the "Edinburgh Review," on Goethe, and on German literature generally. To the translator, however, the great critic gave praise, as "one who is proved by his preface to be a person of talents, and by every part of his work to be no ordinary master at least of one of the languages with which he has to deal." Two years later, in 1827, Mr. Carlyle became a contributor to the "Edinburgh Review," his first article being "The Critical Biography of Jean Paul Richter," followed by an "Essay on German Literature," and his still more popular "Essay on Robert Burns."

Mr. Carlyle was now fairly embarked in literature as the business of his life. In 1827 he had married Miss Welsh, daughter of Dr. Welsh, of Haddington, a young lady who had been his pupil. Another event about the same time happened which exerted no little influence on his future career. His "Life of Schiller" had been published as a separate work; although attracting comparatively little notice in England, it was immensely popular in Germany, having been translated by Goethe, with a laudatory preface. The friendship and correspondence of Goethe confirmed all Mr. Carlyle's German proclivities. From "Eckermann's Conversations with Goethe," we learn how highly the great German appreciated the more liberal tone which Carlyle gave to British criticism:—"It is pleasant to see," said Goethe, "that the Scotch are giving up their early pedantry, are now more in earnest and more profound. When I recollect how the 'Edinburgh Review' treated my works, not many years since, and when I consider Carlyle's merits towards German literature, I am astonished at the important step which has been taken towards a better end." "In Carlyle," said he, "I venerate most of all the spirit and character which lie at the foundation of his tendencies. He looks to the culture of his own nation; and, in the literary

* A fine tribute to the memory of Mr. Buller, from the pen of his former master, appeared in the "Examiner" in 1846.

productions of other countries, which he wished to make known to his contemporaries, pays less attention to art and genius than to the moral elevation which can be attained through such works." "Yes," said Goethe, "the temper in which he works is always admirable. What an earnest man he is, and how he has studied us Germans! He is almost more at home in our literature than we ourselves are. We can by no means vie with him by our researches in English literature."

At the time when this conversation took place, Carlyle was residing at Craigenputtock, a farm in Nithsdale, about fifteen miles from Dumfries. There Emerson found him, some years later, when he first visited this country. "I found the house," says his New England admirer, "amid desolate heathery hills, where the lonely scholar nourished his mighty heart." In that mountain solitude he wrote his exquisite article on "Burns," for the "Edinburgh Review;" several articles on Goethe and other German authors, for the "Foreign Review;" and "Sartor Resartus." Of his mode of life at this period he gave the following interesting sketch in one of his letters to Goethe, which was published by him in his preface to the German translation of the "Life of Schiller":—

"Craigenputtock, September 25, 1828.

"You inquire with such warm interest respecting our present abode and occupations, that I am obliged to say a few words about both, while there is still room left. Dumfries is a pleasant town, containing about fifteen thousand inhabitants, and to be considered the centre of the trade and judicial system of a district which possesses some importance in the sphere of Scottish activity. Our residence is not in the town itself, but fifteen miles to the north-west of it, among the granite hills and the black morasses which stretch westward through Galloway, almost to the Irish Sea. In this wilderness of heath and rock, our estate stands forth, a green oasis, a tract of ploughed, partly enclosed and planted ground, where corn ripens, and trees afford a shade, although surrounded by sea-mews and rough-wooled sheep. Here, with no small effort, have we built and furnished a neat substantial dwelling; here, in the absence of a professional or other office, we live to cultivate literature according to our strength, and in our own peculiar way. We wish a joyful growth to the roses and flowers of our garden; we hope for health and peaceful thoughts to further our aims. The roses, indeed, are still in part to be planted, but they blossom already in anticipation. Two ponies, which carry us everywhere, and the mountain air, are the best medicines for weak nerves. This daily exercise, to which I am much devoted, is my only recreation, for this nook of ours is the loneliest in Britain—six miles removed from any one likely to visit me. Here Rousseau would have been as happy as on his island of Saint Pierre. My town friends, indeed, ascribe my sojourn here to a similar disposition, and forebode me no good result. But I came here solely with the design to simplify my way of life, and to secure the independence through which I could be enabled to remain true to myself. This bit of earth is our own: here we can live, write, and think, as best pleases ourselves, even though Zoilus himself were to be crowned the monarch of literature. Nor is the solitude of such great importance, for a stage-coach takes us speedily to Edinburgh, which we look upon as our British Weimar. And have I not, too, at this moment piled upon the table of my little library a whole cart-load of French, German, American, and English journals and periodicals, whatever may be their worth? Of antiquarian studies, too, there is no lack. From some of our heights I can descrie, about a day's journey to the west, the hill where

Agricola and his Romans left a camp behind them. At the foot of it it was born, and there both father and mother still live to love me. And so one must let time work. But whither am I wandering? Let me confess to you, I am uncertain about my future literary activity, and would gladly learn your opinion respecting it; at least, pray write to me again, and speedily, that I may ever feel myself united to you."

Thus early he seems to have aspired to be a "man of letters" by profession, and has always consistently magnified his office, even on the ground of the highest of all usefulness. "The writer of a book," he says, "is he not a preacher preaching not in this parish or that, on this day or that, but to all men in all times and places?" And again, "He that can write a true book, to persuade England, is not he the bishop, and archbishop, the primate of England, and of all England? I many a time say, the writers of newspapers, pamphlets, poems, books, these are the real, working, effective church of a modern country." Such was his personal justification of the choice of his profession. But it is an exaggerated statement of only a partial truth. The power of the press can rarely be compared with that of the pulpit. Of a book like the "Pilgrim's Progress," or Baxter's "Saint's Rest," the spiritual influence may reach beyond all spoken and unprinted teaching; but how rarely, alas! does the man of letters touch the same themes as the Christian minister! For the most part literature deals with the things of earth and of time alone, not with those of heaven and of eternity. It is a vain boast, therefore, to talk, as Carlyle has done, of "the priesthood of the writers of books" as above "other priesthoods." It is higher only when it deals with the highest of all themes, and with a genius and power attained by few. How far Mr. Carlyle himself has come up to the standard his works must testify, and others besides "men of letters" must be the judges.

About the year 1830 Mr. Carlyle came to London to push his fortune as a man of letters. He brought with him a work which he had composed in his Scottish seclusion, "Sartor Resartus; the Life and Opinions of Herr Teufelsdröckh." Written when under the spell of German influence, this work is characterised by the eccentricity, as well as power, that mark more or less all his subsequent writings. In its main features, as already hinted, the hero of the book is accepted as a kind of mental portraiture of the author. "The world is prone to believe," as one said, "and perhaps it was meant that it should so believe, that the resemblance extends farther than the two lineaments that 'Professor Teufelsdröckh, at the period of our acquaintance with him, seemed to lead a quite still and self-contained life,' and the closing 'private conjecture (of the author), now amounting almost to certainty, that, safe moored in some stillest obscurity, not to lie always still, Teufelsdröckh is actually in London!'"

After various unsuccessful attempts to find a publisher, the manuscript was sent in successive portions to "Fraser's Magazine," where it appeared in 1833 and 1834. The readers of "Fraser" in the United States were the first to discover the worth of "Sartor Resartus" under its strange masquerade of style and opinion. An edition was printed at Boston in 1836, since followed by editions of all Mr. Carlyle's works, including his miscellaneous early writings, which were collected and published in America before they acquired that mark of public approval in England.

In 1837 was published "The French Revolution; a History, by Thomas Carlyle"—the first of his books bearing the author's name.

In the same year he delivered a course of six lectures on German literature in Willis's Rooms, which did not attract much public notice, though the newspapers described the audience as "very crowded yet select." A course of twelve lectures next season, at the Marylebone

entreaties have been made, at home and in America, to deliver other lectures; but, on finishing the last-named course, he declared his fixed determination to have done with that mode of utterance.

Returning to his published works, "Chartism" ap-

With many kind regards.

T. Carlyle

Institution, on the history of European literature, gave promise of greater celebrity as a speaker. Leigh Hunt, in the "Examiner," thus records his impression of the lecture:—"He does not read. We doubted, on hearing the first lecture, whether he would ever attain in this way the fluency as well as depth for which he ranks among celebrated talkers in private; but the second discourse relieved us. He strode away like Ulysses himself; and had only to regret, in common with his audience, the limits to which the hour confined him. He touched, however, in his usual masterly way, what may be called the mountain-tops of his subject—the principal men and things." Two other courses were given—in 1839 on the "Revolutions of Modern Europe," and in 1840 on Hero-worship, the most popular and best known of his spoken discourses. Many applications and

appeared in 1839, his mind having been turned from more pleasant but fruitless fields of literature and history, to the social problems of the time. The same purpose appeared in his "Past and Present," published in 1843, and "Latter-day Pamphlets," in 1850, the strain of which has been re-echoed in his recent political manifesto, "Shooting Niagara." This class of his works displays the earnest thinker and emphatic speaker, but also a man crotchety and erratic, straining after impossible optimisms, but giving little help to real and practicable reform and progress.

Meanwhile, the great work had appeared by which Mr. Carlyle's name will be known in English literature and history, "Oliver Cromwell's Letters and Speeches, with Elucidations." "The Life of John Sterling," published in 1850, though praised by Mr. Carlyle's

admirers, and containing much that is interesting, is a melancholy production, to be best passed over in silence. His last great work is "The History of Frederick the Great," of which he has made the most in his own way, but evidently finding it up-hill work to make a hero of old Fritz.

Until summoned to deliver his inaugural address when elected Rector of the University of Edinburgh, in 1866, with the exception of his appearance as a lecturer, Mr. Carlyle has lived the life of a recluse in his house in Cheyne Road, Chelsea, like Teufelsdröckh in his "high Wahngasse watch-tower." Without family, his books have been his children, his love of them, till lately, shared by the partner of his early years and sympathising companion of his studies.

Our object being to give merely the outline of the life so far as the public has to do with it, we have contented ourselves with bare enumeration of the works which have raised Mr. Carlyle to his high place among the notables of the age. No man living has exerted wider and deeper influence on the rising generation of authors and educated readers. It is the more necessary to point out how far that influence has been for good, and how far we consider him to be an unsafe guide. It would be idle, at this time of day, to criticise his peculiarities either of thought or diction. *Magnæ virtutes sed magna vitia*—great excellences but also great faults—is a saying emphatically true in his case. The power, the independence, the originality of his views, and the rugged strength of his language, are admitted on all hands. What faults and eccentricities there are, either of matter or manner, have long been essential parts of the man, who nevertheless surprises, and sways, and delights every thoughtful reader, even when dissenting from him. It matters not that his writings defy all canons of taste and rules of literature. After one of Frederick the Great's victories an old field-marshal demonstrated that the battle ought to have been lost—it was fought contrary to all the rules of war! Success silences all criticism about Mr. Carlyle's style, although it ought not to extort indiscriminate praise, still less to invite servile imitation. Let us hope that "Carlylese" will die with Carlyle.

A far more important matter it is to protest against, not merely the aping of his style, but the utterance of his paradoxes. At the bottom there appears in Mr. Carlyle's works a reverence for truth and religion, but overlaid with what he would himself call guano-mountains of cant and rubbish. No man could write as he has done about Luther, and Knox, and Cromwell, without a belief in things not dreamed of in mere philosophy. But when he makes "earnestness" the one great test of truth, and "sincerity" the sole test of moral greatness, when he talks of "the gospel of labour" and "the sacredness of work," when he denounces all existing political and social systems as "shams," he utters the ravings of a self-deluded "prophet." True, men must believe, men must be earnest, must be sincere, or there is no hope of them. But men must also take heed what they believe, and about what they are in earnest. In Mr. Carlyle's earnestness, truth and falsehood, good and evil, are confounded, and all moral distinctions broken down. With him sincerity covers a multitude of sins. With him zeal is good, whether with or without knowledge. Amidst all his paradoxes he himself may distinguish between human and divine truth; but the effect of this confusion of right and wrong, this calling good evil and evil good, must be disastrous on the minds of many who look to him as an oracle. It is a terrible responsibility for a man to wield such influence, and

to use it in a way likely to foster unbelief in revealed religion, and to throw discredit on the gospel of Christ, as the divinely appointed remedy for the wrongs of life. In his last and greatest public effort, the address at the University of Edinburgh, while there was much shrewdness of statement and earnestness of advice, the tone rose no higher than that melancholy utterance from the death-chamber of his friend John Sterling, who thus wrote to him: "On higher matters there is nothing to say. I tread the common road into the great darkness, without any thought of fear and with very much of hope. Certainty, indeed, I have none." What a contrast to the words of Archbishop Leighton, addressing from the same place a similar assembly:* "The wise man alone feels true joy, and real wisdom is the attainment of a Christian only, who bears with life, but hopes for death, and passes through all the storms and tempests of the former with an undaunted mind, but with the most fervent wishes looks for the latter, as the secure port and the 'fair havens,' in the highest sense of the expression; whose mind is humble, and at the same time exalted; neither depending upon outward advantages nor puffed up with his own; and neither elevated nor depressed by any turns or vicissitudes of fortune. The only thing he desires is the favour and countenance of the Supreme King; the only thing he fears is his displeasure; and, without doubt, a mind of this cast must of necessity be the habitation of constant serenity, exalted joy, and gladness springing from on high. . . . Whatever may be your fate with respect to other things, it is my earnest request that it may be your highest ambition and your principal study to be true Christians; that is, to be humble, meek, pure, holy, and followers of your Captain wherever he goeth; for he that follows Him shall not walk in darkness, but be conducted, through the morning light of Divine grace, to the meridian and never-ending brightness of glory."

THINGS GONE OUT OF USE.

BY JOHN TIMBS.

II.

QUACK medicines have extraordinary longevity. There is an old nostrum called Heal-all, which may have been taken from the All-heal of the Druids, our most ancient doctors. Daffy's Elixir is of early date. Godfrey's Cordial has been working its mischief many years; for, more than a century ago, in 1756, we find it enumerated among the medicines employed by the nurses at the early periods of the Foundling Hospital, to give a long and effectual quieting to the children committed to their care. Scot's Pills were sold upon the same spot for nearly two centuries, in the Strand: they were originally made by a physician to Charles I, and we find them advertised in 1699, as "sold at the Golden Unicorn, over against the Maypole, in the Strand;" the shop disappeared in the year 1865. John Moore, "author of the celebrated Worm-powder," lived in Abchurch Lane, in the time of Pope, who thus apostrophised him:—

"O learned friend of Abchurch Lane,
Who sett'st our entrails free!
Vain is thy art, thy powder vain,
Since worms shall eat e'en thee."

The great worm-destroying school of our time was Dr. Gardner's, in Long Acre, with its rows of worms preserved in spirits; but they have "gone out of use."

* "Exhortations," by Archbishop Leighton, Principal of the University of Edinburgh.

We miss, too, the Anodyne Necklace, recommended for cutting teeth by the inventor, and by another doctor, who possessed the secret; in this case the doctors did *not* differ.

Sight-seeing has been much economised in our time, as well as improved in character. In the "Tatler," 1709, we read:—"On Thursday last I took three lads a rambling in a hackney-coach, to show them the town, as the lions, the tombs, Bedlam, and the other places, which are entertainments to raw minds." The lions have been removed from the Tower, since 1834, to the Gardens of the Zoological Society in the Regent's Park. It usually cost one shilling to see the few animals at the Tower. The whole menagerie, the finest in the world, the Zoological Society's, can be seen for sixpence, not shut up in close and dark rooms and cages, but enjoying light, air, and ventilation. To see the jewels at the Tower formerly cost half-a-crown; the fee is now sixpence, and the amonuries are proportionately reasonable. St. Paul's and Westminster Abbey, once costly sights, may now be seen for a trifling sum. Bedlam is altogether a different sight from the horrors of the old hospital in Moorfields. We can just remember the crowds in the Fields to see the patients at the windows of one of the galleries of the old place. The four sight-loving folks in the "Tatler's" hackney-coach must have had several shillings to pay for their ride.

This brings us to the change in public conveyances. The Hackney-coach was from the first an expensive affair, though its rate was fixed by Act of Parliament. It was then one shilling a mile; it was uneasily hung, and so narrow as to be taken for a sedan on wheels; and there were all sorts of abuses in the licensing and hiring, and increase of fares. Gay describes the vigilance of the driver in his time:—

"When on his box the nodding coachman snores,
And dreams of fancied fares."

The next Hackney-coach was double-seated, large, and cumbrous, and usually a cast-off carriage, often to be seen emblazoned with the arms of its former noble owner. This lumbering coach was drawn by two horses, and the driver was "notoriously rude, exacting, and quarrelsome." The coach was next modified to a chariot, still drawn by two horses. Then came a succession of *cabriolets*, which mostly settled down into the cab or sedan-like coach-body upon four wheels, drawn by one horse, and reminding us of a seventeenth-century coach, such as we see sculptured on Thynne's tomb in Westminster Abbey.

The Thames Watermen and their Wherries have almost disappeared, after three centuries and a half existence as a Company, and their affairs being regulated "by the most wise, discreet, and best sort of watermen." Their Water-poet, with his fellow-watermen, violently opposed the introduction of coaches as "trade-spillers." The Company condemned the building of Westminster and Blackfriars Bridges for their injury to the ferries between Vauxhall and the Temple, the profits of which were given to the poor, aged, decayed, and maimed watermen and their widows; in both cases the Company were compensated for their losses. The wherry was an expensive craft, and was blown out of the water by the steam-boats, which were as fatal to the watermen as railways to stage-coachmen. In all these scrambles the public have been the gainers. The only Horse-ferry on the Thames—that between Westminster and Lambeth—was granted by patent to the Archbishop of Canterbury, under a rent of twenty pence. On opening Westminster Bridge, in 1750, the ferry ceased, and £2,205 were given to the See as an equivalent. There were two large inns at the

ferry, for travellers, who, arriving in the evening, did not choose to cross the water at such an hour, or, in case of bad weather, might prefer waiting for better. At Blackfriars, before the building of the bridge, was a ferry, the fare of which, late at night, and in rough weather, was 4s. each passenger; an old customer, who clamoured loudly for the bridge, is known to have been one of the loudest in protesting against the half-penny bridge toll!

The changes in laws are too extensive a field for us to venture in; but we must mention a barbarous punishment which was inflicted in the metropolis not forty years since. This was the Pillory, which existed in England before the Norman conquest, and for centuries was the great institution for the punishment of a variety of offences, especially for "lies, slanders, falsehoods, and deceits;" and it was much used for fraudulent bakers. The Pillory was made in various forms; the simplest was a wooden frame or screen, raised on a pillar or post, several feet from the ground, and behind which the culprit stood supported on a flat form, his head and hands being thrust through holes in the screen, so as to be exposed in the front of it; and thus he stood for an hour or longer. The Pillory was originally intended more for the exposure of the persons to ridicule and infamy than bodily punishment. But in most cases the mob took the punishment into their own hands, and the pilloried persons were mercilessly pelted with rotten eggs, cabbage-stalks, and even stones, and sometimes died from this brutal treatment. We remember to have seen four persons in the pillory at the north end of Fleet Market, about the year 1812. The last person so punished was one Bossy, for perjury, in the Old Bailey, in 1830; but the Pillory was not abolished by law until 1837.

The improved Lighting of our Streets must have been a great moral benefit to the population. Persons of rank and wealth, in the last century, were borne in their sedans, preceded and followed by footmen bearing flambeaux; and there is a curious print of Leicester Square in the reign of George II, showing the Prince of Wales borne in his Sedan towards St. James's, attended by halberdiers and his suite. The Duchesses of Gloucester, Hamilton, and Dowager Northumberland, and the Marchioness of Salisbury, were the last to retain this antiquated mode of conveyance. In entrance-halls is occasionally kept the old disused family Sedan, emblazoned with arms; we remember to have seen three Sedans at Argyll House, one for state occasions. In the iron-work facing old mansions may be seen large extinguishers, by which the footmen attending Sedans put out their flambeaux or links.

Lighting the streets was provided for in early times, of which, however, the lamps which reached us were but sorry specimens. The light of the old oil-lamp made darkness visible, and was commonly compared to a pin-head. Dr. Johnson, when he lived in Bolt Court, is said to have one evening, from a window of his house, observed the parish lamp-lighter ascend a ladder to light one of the oil-lamps. He had scarcely descended the ladder half-way when the flame expired. Quickly returning, he lifted the lamp-cover, and, thrusting the end of his torch beneath it, the flame was instantly communicated to the wick by the thick vapour which issued from it. "Ah!" exclaimed the Doctor, "one of these days the streets of London will be *lighted by smoke*." But the change was beset with all sorts of difficulties. The Chinese, it is reported, lighted their streets and houses with coal-gas, ere we had attempted it; and among the mistakes about Gas-lighting, it must not be forgotten that such scientific men as Davy, Wollaston,

and Watt, at first gave an opinion that coal-gas could never be safely applied to the purposes of street-lighting. How extensively it has been achieved is shown by the fact that in 1865 nearly two millions of money were paid for gas-lighting the metropolis. In the change we have parted with the dirty lamplighter and his flaring torch, redolent with Greenland oil; and have done away with the ladder, the gas being lighted by a simple contrivance of the person on foot. There is an account of a public lamp being kept up in a part of Billingsgate ward, where, upwards of 200 years ago, a citizen fell at night and broke his leg, and afterwards bequeathed the sum of £4 a-year for the maintenance there of a public light at night for all time. The money has been paid for two centuries, and, since the introduction of gas, to a gas company, who have superseded the old light.

Among the things of the past are the flint-and-steel Tinderbox, and the familiar cries of the Match-sellers:—

"Here's your fine tar-barrel matches,
Sixteen bunches a penny—sixteen a penny."

Or,

"Come, buy my good matches—come, buy them of me,
They are the best matches you ever did see;
An old woman lived in Rosemary Lane,
Who dipped them, and dyed them, and I do the same."

Such were the brimstone matches; but we shall presently see how other matches have been provided for the venders. The tinderbox is now a rarity; and we read of an intelligent person who, when searching for matters of greater importance, inquired in many parts of the metropolis, and in many districts of England and Scotland, without finding the tinderbox. At last he found one in a village not far from the venerable Stonehenge, on Salisbury Plain—a primitive part of England, where old customs still linger; and where, we are told, some few persons still continue to use the flint-and-steel tinderbox.*

In the Ashmolean Museum, at Oxford, we remember to have seen a large old Tinderbox, reputed to have been of Charles the Second's time. To "strike on the tinder," as Shakespeare has it, was no easy matter but for an adept; and the quality of the matches had something to do with the success of the process. They were much made by gipsies; and we knew a kind-hearted old gentlewoman in Oxfordshire who gave every year to a tribe of gipsies wood enough to make a year's stock of matches, and by that means secured her farm from their depredations.

For many centuries the apparatus of a stone struck against a piece of iron, continued, with but little improvement, to be the only means of procuring light. By the Saxons the flint was called the *fyr-stone*; and iron was the forerunner of steel. A piece of steel, with the faces cut into many angles, was used early in the Middle Ages. The flint and steel was made the principal device in the collar of the Order of the Fleece, in 1429; and the form continued to exist to the close of the history of the old-fashioned Tinderbox.

This was at length ousted by a chemical manufacturer of great ingenuity. There had long been prepared by chemists, phosphorus boxes of matches, to be rubbed upon a cork to produce light; whilst others were to be dipped in a little bottle of sulphuric acid and asbestos. But these were costly inventions, ranging from 1s. 6d. to

5s. each box. They were uncertain; for we have known nearly a whole box consumed ere one match could be lighted by a nervous hand. The Lucifer Match proper dates from forty years ago, when Mr. John Walker, a chemist and druggist at Stockton-upon-Tees, was preparing some lighting mixture for his own use. By accidental friction on the earth, with a match dipped in the mixture, a light was obtained. The hint was not thrown away: Mr. Walker commenced the sale of friction matches in April, 1827; and Dr. Faraday lent his authority to bring the discovery into general use. Mr. Walker died at Stockton in 1859, aged 78.

The manufacture of these matches is now carried on in England to an enormous extent. In 1861, at one large saw-mill in London, might frequently be seen six or eight piles of yellow pine, each as large as a six-roomed house. The deals are cut by circular saws, revolving with great velocity, into pieces three or four inches long; and these pieces of block are cut into *lucifer splints* by a machine with fifty sharp knives or cutters, fixed in a row. Five blocks are cut at once; there are 30,000 cut in a minute, or 1,800,000 in an hour; and three of these machines, working ten hours a day each, would produce 54,000,000 per day. But at Frankfort, N.Y., is a manufactory, in which the matches are cut, dipped, and delivered, and the boxes made, entirely by machinery! At Dixon's factory, near Manchester, from 6,000,000 to 9,000,000 of matches are produced daily. The Lucifer Match is a simply beautiful and efficient contrivance, the result of a long series of improvements on the old sulphur match of the Tinderbox; and it owes its present efficiency for the most part to phosphorus. Nevertheless, its ready inflammability leads to innumerable accidents; but the "Safety Match," being tipped with a material which is not inflammable *per se*, requires to be struck upon a chemically prepared substance to produce a flame. The carelessness of persons in using the ordinary lucifer match is stated to cause a loss to the Sun Fire Insurance Office of £10,000 a year.

The employment of dogs in place of boys to turn the roasting-spit in a kitchen has lasted to our time. The dog was placed inside a wheel, which he turned with his fore-feet, the wheel being connected by a chain with the wheel end of the spit; the action of the dog resembling that of a squirrel in a revolving cage. Doctor Caius, who wrote on dogs in the sixteenth century, describes "a certain dog in kitchen service excellent; for, when any meat is to be roasted, they go into a wheel, which they turning about with the weight of their bodies, so diligently took to their business, that no drudge nor scullion can do the feat more cunningly, who the popular sort hereupon term *turnspits*." Mr. Jesse remembers watching these dogs at the house of his schoolmaster, in Worcestershire. "They were long-bodied, crook-legged, and ugly dogs, with a suspicious, unhappy look about them, as if they were weary of the task they had to do, and expected every moment to be seized upon to perform it." In a "Tour" published in 1800 is an engraving of a dog so employed, at Newcastle, near Carmarthen; and, in the kitchen of the ancient Castle of St. Briavel, on the edge of the Forest of Dean, may be seen this contrivance for the dog to turn the spit. Well-authenticated anecdotes are related of one of a couple of turnspit dogs refusing to work the spit because it was not his turn. Who does not recollect Gay's charming fable of "The Cook, the Turnspit, and the Ox?"

"The dinner must be dished at one.
Where's this vexatious turnspit gone?
Unless the skulking cur is caught,
The sirloin's spoil, and I'm in fault."

* The word *tind*, though from the Saxon *tindar*, and employed by Wickeliffe, Milton, and Dryden, is now little used. It signifies "to ignite either fire or candle; to light, to kindle;" as "tind up the candle." Sanderson, in a sermon of 1659, has "as one candle tindeth a thousand." To *tine*, *tin*, *tend*, or *tind*, is still current in rural districts. Formerly, in Derbyshire, it was customary to light up, on November 2, small fires amongst furze, and call them by the name of *tindles*.

Then the poor dog's lament of his lot :—

Was ever cur so cursed? he cried.
What star did at my birth preside?
Am I for life by compact bound
To tread the wheel's eternal round?"

The economical practice of burning peeled Rushes drawn through melted grease was common till towards the close of the last century, and there was a regular utensil for holding the rush in burning. Gilbert White describes this simple piece of domestic economy, and shows how each rush, before dipping in the fat, costs one thirty-third of a farthing, and one-eleventh afterwards. Thus, a poor family will enjoy five and a half hours of comfortable light for a farthing, while the very poor, who are always the worst economists, and therefore must continue very poor, buy a halfpenny candle every evening, which, in their blowing open rooms, does not burn much longer than two hours. Aubrey describes this rush-burning at Ockley, in Surrey, about the year 1673, which may have been derived from the Romans, who were much in this neighbourhood; for Pliny tells us that the Romans employed rushes for candle-wicks.

LIFE ON AMBA MAGDALA, THE STATE PRISON OF ABYSSINIA.

We have received from one of the captives in Abyssinia, the subjoined paper, containing a most interesting account of prison life at Magdala. Some of the letters previously received by his relatives in England, describe the difficulties under which correspondence with the outer world has been managed. On the 9th of June, 1867, he wrote, "Tell my parents that for more than a year we did not write at all, for fear the letters might be taken. Afterwards, when we began to take courage, we sent only such small letters as could be sewn in the clothes of servants." On the 3rd of September, "Ellen (his wife, one of the prisoners at Debra Tabor), thinking I might be without money, sent some Venetian gold pieces in a hollow stick." The rebels between Debra Tabor and Magdala allowed these messengers to pass, while refusing passage to any of the King's people. One of the earliest letters, 17th July, 1865, was written when both feet were loaded with heavy chains, and the right hand fettered together with the feet, "so that I am not able to stand upright, and I believe a bed of three and a half feet in length is quite sufficient for me." During the latter period of the captivity more liberty has been allowed, as will appear from the following narrative, which he has contrived to write, and which reached us in November :—

WRITTEN IN AUGUST, NEAR THE END OF THE RAINY SEASON, 1867.

I.

MAGDALA, which till now scarcely occupied a place on the map of Abyssinia, has been made so familiar to all those who sympathise with helpless suffering, that I think a few remarks on this remote locality may not be devoid of interest at this present moment.

The manners, tastes, character, and occupations of the people are pretty nearly the same throughout Abyssinia, and, having given a description of them of one district, all that can be said of the country at large is known. But as there is a marked difference, even in England, between a quiet country village and a garrison town, it cannot fail to be so here, where only two classes of people are residing—the soldiers and the prisoners—whose position is identical in this particular, that neither of the two are free agents, and that, once here, *both* must remain until it pleases their tyrannical master to remove

them. Before referring, however, to each of them specially, it is necessary that some account should be given of the locality, which is as unique in its character as the population inhabiting it.

Magdala, a nearly circular rock, about one mile and a half in length, situated on the most southern extremity of Amhara Proper, and bordered on the north by Dwnd, and on the other sides by the Wollo Gallas, is generally said to be a mountain fortress, which term conveys to our minds the idea that it is considerably elevated above the surrounding country; but this is not the case. It was in antediluvian times a portion of a large plain; but changes in the surface of the country have caused it to be now surrounded partly by a chasm, the bed of mountain torrents during the rains. The opposite plain towards the south raised itself slantingly, while the other tract of land, from here past the Bashiloh until Dwnd, presents one confused mass of tremendous rocks, precipices, and ravines, on whose sides and depth the worst of roads in Abyssinia winds along. Magdala is approached on the northern side by a small pass, leading to a platform of some thirty acres of ground, called Selamke, and fifty feet more of ascent and the gates of the Amba (hill-fort) are reached, of which there are two, a northern and an eastern, both too feeble to sustain any great amount of pressure. Although offering insurmountable obstacles against any efforts to reduce it which might be made by the native rabble, who are called soldiery, yet a European is surprised that a place so weak and so easily to be taken should be chosen as the storehouse of the riches, and, what is of equal value, for the confinement of the prisoners of the king. The opposite Galla border, higher than Magdala, is not farther than 800 yards, while the other hills overlooking it are near enough to be made use of for batteries. During the rainy season, when the smallest rivulet becomes impassable, Magdala is entirely cut off from all communication with the rest of Abyssinia, by a river which rises in the mountains of Lasta, takes first a westerly direction, makes, about a day's distance from here, near Amba Geeshen, a sudden bend, sweeps south-west past Magdala, between high but narrow rocky beds, takes in its course the Fiddah, a river of nearly equal size, as well as a great number of temporary streamlets, torrents, and cataracts, carrying everything before its force and speed, and joins the Abbäy, or Abyssinian branch of the Nile, about three days' distance from here.

The scenery towards the west, in the district of Worierlaimanot, is indeed grand and imposing at all times, but more so this season. Looking over those regions in the morning, after a copious fall of rain, one sees at the distance of four miles, in a straight line, no less than seven cascades, dashing into the chasm from a height of several hundred feet, and causing their roar to be heard far and wide. At this hour the high banks fronting Magdala are covered with a beautiful dense white cloud, like a curtain hiding from view the mountains behind it. As the sun shines forth, shedding his splendour on the scene before us, the vapours gradually vanish, the tumbling waters, not unlike a number of broad silvery streaks, momentarily detained by a projecting block, are repelled, thrown into the air as spray, and look like so many diamonds reflected on by the light. There rises now in the background a chain of mountains, to the height of 14,000 feet, whose tops are the greater part of the year overspread with snow.

The climate is very salubrious, and not at all what one expects so near the line. In consequence of its altitude of 9,000 feet, it is never unbearably hot in the day, while it is pleasant enough to sit near a nice fire mornings and

evenings, all the year round. A bracing and refreshing wind is wafted continually from the Galla plain, which carries away the unhealthy vapours from crowded and dirty places, such as the common prison, and preserves its unfortunate inmates in spite of filth, hunger, and nakedness. The seasons also differ from the rest of Abyssinia, except the Wollos and Shoah. Until two days' distance from here, the periodical rains last four months uninterruptedly, with mostly unpleasant, dark, chilly days, and such fearful thunderstorms and vivid lightnings that one is sometimes inclined to think the very foundations of the earth will cleave asunder. For eight long months subsequently the heaven, hermetically sealed, hangs above like brass, and the blue sky, in beautiful monotony, does not yield, except by caprice, one drop of water to refresh the dying vegetation. Magdala, however, enjoys an occasional shower during the ten months of summer, although not of sufficient quantity to carry on cultivation. Any one having resided in tropical climates can appreciate such changes; for, though it may not revive the drooping plants in the garden, yet it supplies the human frame with fresh energy, and the mind with buoyancy. The remaining two months of the year are filled up by what is frequently denominated winter, with clear sunny days—except sometimes in the afternoon, when a heavy storm of short duration bursts forth—and rainy nights. During this season everything grows most luxuriantly. European and Indian vegetables can be cultivated with little trouble and no expense, and one has soon the satisfaction of seeing more foliage and stronger stalks than the same plants have in Europe. There is here a bed of English sweet peas, quite giants in their kind. Sown about two months ago, they have reached the height of eight feet, and may add two more before they fade. The leaves are at least five inches in diameter, and the stalks are stout enough to stand nearly without support. Also some tomatoes seven months old, which are in Egypt and elsewhere no more than shrubs, have been so trained as to form a large bower. The plants measure at least fifteen feet from the ground. They have yielded an abundant return for several months past, and are at the present moment literally crowded with ripe green fruit of every size, blossoms, and buds. By occasionally watering them in the summer, they always bear. Trees of any size would not succeed, except on a hill on the south-west, because only a few feet of soil overspread the rock. Thus it will be perceived that Providence has dealt very bountifully with this part of the country, giving it "rain from heaven and fruitful seasons;" and it remains only for its population to divest itself of slothfulness and indifference, in order to convert it into a beautiful garden.

Previous to 1853 Magdala was a Galla possession; but when the ambitious Theodorus, not satisfied with his conquests of the whole kingdom, turned his eye towards Shoah and the Wollos, whom no human power had hitherto been able to teach why they should not declare themselves independent as soon as the invader had left their territory, he thought it necessary to take Magdala in his road first. The besieging army arrived under its gates, but was successfully repulsed by means of great stones being hurled down. A number of Amharas were killed, and, acknowledging the futility of their efforts, withdrew out of the reach of those destroying missiles. The Gallas, however, in their turn, reflecting that the invincible Theodorus had prostrated at his feet Ras Alew, ruler of Amhara, Dejaz or Dedjatch Ooi of Tigré, and the hereditary powerful governors of Godjam, Dedjatch Goshoo, and his son Birroo, became disheartened, and

resolved to evacuate the fortress. In the stillness of the night they accordingly fled by a third now closed gate, and were not perceived by the enemy. During the following few days the soldiers of the king, not having forgotten yet the first spirited defence, were afraid, in spite of the encouragements and threatenings of the master, to expose their heads again; but when, after another lapse of some days, no living being appeared and no stones were flung, an old man ventured to ascend, knocked against the door, and succeeded in opening it. He entered, scanned the plain before him, but discovered nothing hostile; then he called his expectant brother warriors below to follow him. After repeated persuasions, he at last induced them, headed by the brave Theodorus, to proceed. A grand *fête* was given by the victorious Emperor, at which the soldiers boasted of their gallantry and feats of heroism. Thenceforward Magdala was employed solely as a store-house. But when, in November, 1864, Theodorus received tidings of the revolt of the Shoas and the Gallas, and planned an expedition, he imagined, as he had done for many years past, that the Turks would attack in his absence the strong mountain fortress of Tchelga, on the north-west confines, and transferred therefore all his living property to Magdala, which after that time became the state prison of the kingdom. Fifteen hundred fusiliers and spearmen were left to garrison it and to guard the prisoners, headed by a Ras and council of nine, which is, however, so constituted that not one of them can perform the merest trifle without consulting the opinion of the rest, and not even the Ras himself is allowed to pass the gates unless he has previously obtained the permission of all the chiefs. The private soldiery are under the same restriction in this respect. Everything is so cunningly, and with so much foresight, arranged by the suspicious tyrant that treachery is all but impossible. It must be confessed that no greater calamity could befall him than the loss of this Amba—nothing would more hasten his fall and inspire the rebels with more courage and confidence. He therefore does everything in his power to make the guards contented with their lot, and pays them well—that is to say, better by far than the soldiers in the camp, when he has the means of doing so. But his treasury is not always filled, and lately, when he perceived his power gradually dwindling down, in order to keep the garrison loyal, in lieu of ready cash he promoted them in military rank, gave to all the petty chiefs high-sounding titles, and—strange anomaly—made of every common soldier a nobleman. Although they are supposed to receive rations and emoluments according to their newly-acquired station, and expected their respective salaries to be proportionately increased, yet they did not even obtain the much-desired silk shirt, the mark of their nobility. The royal granaries are nearly exhausted, the surrounding districts rebellious, so that no fresh supply can be expected, and the little money which was given to them in different instalments for the last fourteen months—twenty Maria Theresa dollars for the Ras and other high functionaries, fifteen for Ambels (colonel), and ten for the inferior officers—have long since been spent. But pride is inherent in the nature of the Abyssinian. Although he comprehends well enough the worthlessness of his title, preferring much rather a measure of grain, yet he is happy enough if he can but be called by his inferiors a noble of the realm, and denominate himself the slave and donkey of King Theodorus. According to old-established customs, nobody could be a Dedjasmach, save a hereditary governor of a province, a prince in his own right, or one who was appointed by royal decree deputy over a part of the country, and to whom a special license

was given to have a certain number of negareets (drums). Byētroadad, however, rank in the army second after the King, of whom there were never more than eight in the whole army; but Magdala contains as many now, and Dedjasmatches more than the entire empire, which is at present parcelled out by rebels, possesses provinces. I would remind the reader that the ruler of Abyssinia does not stand isolated in the history of nations in this wholesale creation of nobles. Maria Theresa of Austria, after the sanguinary seven years' war, wishing to reward a regiment of Hungarian soldiers for their bravery and the eminent services they had rendered her, ennobled every one of them; and, although they possessed nothing in the world to support their new position becomingly, they were glad enough to prefix a "Herr von" to their Magyar names. Human nature is everywhere the same, and, whether European or African, the descendants of both will extol for many generations, whether deserved or not, the heroism of their ancestors.

The duties of the common soldiers (for so I shall term all those to the degree of Ambel, for the sake of distinction) are not onerous. They have to guard the gates, the pass leading to Selamke, the King's store-house, the outer hedges of his harem, his new "friends," the Europeans, and the common prison. They have to cut and carry the wood for hedges, and for the houses of the King and chiefs. No great taste or architectural beauty is exhibited in these public buildings—all are of a conical shape, built of branches, plastered with mud, and having a roof of reeds and straw. At stated times, when the female servants and slaves descend to the opposite side of the chasm for the sake of gathering wood, they are accompanied by soldiers, lest they should be carried off by way-laying Gallas. If a female is seized by them, she is sold as a slave; if a youth or boy, he is cruelly mutilated, and frequently killed on the spot. Such an instance happened not many weeks since.

The mode of guarding the prisoners must not be supposed to be as rigorous as would be the case in Europe were there no substantially-built prisons existing. The soldiers do not trouble much about watching, and it is therefore no difference to them whether the prisoners sleep in their hut on a tanned skin—not possessing anything further in the way of bedding—or in the prison. In order, however, that an idea may be formed of how they execute their duty, let us imagine them to be on guard in the enclosure of the Europeans. Towards dusk a petty chief arrives with about a dozen men, carrying matchlocks, which it would cost great persuasion to entice to fire, or with spears and shields, and each a piece of wood in his hand for a fire, around which to beguile a few tedious hours. A tent being pitched during the rains, or sitting in the open air at other seasons, they dispose of their arms, and smoke, passing the same pipe round. At first the meeting is quiet and decorous enough; but as the minutes fly the conversation becomes more lively; stories, not always of the most modest kind, are related; jokes at one another's expense are dealt out, which are hailed with roars of laughter by the gray-headed and the youth. It seldom fails that a musical genius is amongst them* whose voice and improvised

rhymes delight and elicit the undivided admiration of the circle of friends into whose mind no thought about their charge has entered yet. The mirth and gaiety increase every moment. The *kerar*, a primitive-looking musical instrument, with but three strings, and as many discordant notes, of which Tubal Cain even would have been ashamed, joins its monotonous air. Now the noise is at its height. A youth, on whose chin the first signs of manhood have not appeared as yet, and in whose hand the spear has not quivered, except for exercise, jumps in front, and with the mien of a maniac, raised arms, and the whole body convulsed, bawls and brags of his personal valour and his chivalrous deeds. Sometimes this little *soirée* is interrupted by high words and quarrels, which can only be appeased by the chief with such sound arguments as the stick. Order restored, it is soon time to disperse to the different houses which the Europeans inhabit. Two guards enter without ceremony—and with their spears, shields, and heavy bludgeons, the very image of shillalahs, wherewith to inspire respect—the humble abode where two of us are preparing for rest. Having disposed of their arms, they unwind their girdle, a piece of cotton cloth half a yard broad by ten yards long, which is twisted round and round their bodies. I must stop short to say a few words about this article of dress. Barbarous as it appears, the girdle is of great value to the Abyssinian. It supports him in his work, and his many walks over mountains and through deep valleys, and he would live all his life on the poorest fare rather than be deprived of his digg. I have many times thought that the girdles which were worn in Palestine must have been something similar; perhaps more artificial, but just as bulky. If so, what a beautiful metaphor is that which the apostle employs in speaking to the Ephesians, vi. 14, "Having your loins girt about with truth," that you faint not in your ascents and descents and wanderings through life. Practise every self-denial rather than be for a moment without this treasure—truth.

Having approached the fire, one of them utters a characteristic grunt, an invitation to talk to them. Knowing that they possess no art of life which is not imported from other lands, the Abyssinians yet imagine themselves the most superior, the most enlightened, and most civilised beings on the face of the earth, and heartily despise the Europeans; but their lamentable ignorance never appears to greater disadvantage than in these conversations. Their knowledge of geography is so limited that they are only aware of four countries—viz., "England, Jerusalem, the Turks, and Moscow"—besides their own, which they think the largest and best cultivated. Speaking of the direction they are situated, they have no other term but "this side or the other side of the sea;" and, although repeatedly assured that Europe possesses more commodities, and in larger quantities than are necessary for consumption, they ask the same questions over and over again: "Is there grass, rain, cows, grain, and churches in your country; and are the dead buried or left for food to the hyenas?" On being told that we are deficient in teff (grain in appearance like the seed in grass), hydromel, and mules, Europe is abandoned as lost. Not unsimilar to the Arab who had visited England: when relating all the wonders he had seen abroad, his *confrères* became so enraged with him that they resolved upon his death; but on being informed that there exist no deserts and no green palm trees in that far-off region, they were reconciled to him, saying, "No country like our own." There are, however, a good number now of these uninvited guests who endeavour to draw profit from their

* I annex a specimen of an Abyssinian war-song, with a rough paraphrase in English:—

"Agarekh rook nān
Sheshtah, ātesālekoo
Goradekhēn māsasoo
Surekh Anānakoo."

"Thou art far from the land where thou first saw'st the light,
Therefore stand thy ground firmly, and think not of flight;
Thy faulchion unsheathe, and prepare for the strife;
A victor return, or bid farewell to life."

intercourse with us, inquiring about religion. Corrupt as the Abyssinians are in morals, and in their doctrines of Christianity, they are at all times ready and willing to converse on religious subjects.

Having satisfied all their interrogatories, they look once more with an eye of envy on our simple bed-clothes, talk of their distress, beg for some snuff and a shirt (they find, to their grief, that neither one nor the other is to be had), say their prayers in Ethiopic, of which they don't understand a syllable, in an irreverential and hurried manner, spread their skin, search, like the patriarch Jacob, for a stone as pillow, wrap their shamahs—which by imaginative minds has been compared to a Roman toga, but which has more resemblance to a sheet—closer around their bodies, forget their spear and formidable club, and sleep until the morning as sound as if they had been drugged. If one or the other of us rises at night, and the guardians notice it by accident, they inquire why they are not called. Curious request: the prisoner to entreat the soldier to watch him!

Bowing and cringing to the superior, and arrogant in manners to the inferior, this has become second nature in the Abyssinian. He *must* profess love where only antipathy exists, and loyalty when hatred rankles deeply in his breast. His pride knows no bounds: however ragged his clothes may have become, he would think it far below his dignity to walk a hundred steps without being followed by one or two little ragamuffins; and even the women, whose white loose cotton dresses are black and shining with grease (dropped from their butter-anointed heads), would be ashamed to go to the market without a few silver tinsels round neck and ankles, and attended by a maid-in-waiting.

Now and then the monotony of the existence of the garrison is broken by a feast, given by some chief in honour of a saint, or on a holy day; and then they can gorge themselves with brendo (raw meat fresh from the cow), and drink as much bad mead as they like, and deck themselves with the remaining shreds of their silk shirts, and boast to their hearts' content. Things, however, have entirely changed in this respect now. The King is not in a position to give them cows or money, the officers have nothing to spare, and the soldier is half-starved and ill-clad. The wife of the latter spins some cotton, makes a basket, disposes of a few things which may be left in the house to appease the gnawing hunger. A little barley bread and red pepper would suffice them if it can but be got. Many would gladly desert to the rebels, but to be caught involves the most cruel, lingering death—more cruel by far than to be guilty of the same crime in the rebel camp. He must drag along his miserable life, until a new master opens new sources and inspires with fresh hopes, or until a gleam of success light upon the head of the old one.

A great deal of dissatisfaction has been manifested lately. Several houses were set on fire, some desertions took place, and soldiers expressed their real sentiments to faithful comrades. The chiefs, who have nothing to gain, but everything to lose, with a new ruler, perceived this state of things with terror. Quickly a report was spread that a royal messenger had arrived, with the news that the King has conquered a rebel, and that he himself is coming soon. Immediately the cannons and guns are fired, men are shouting, and women join in the general excitement which these glad tidings have produced: not that they rejoice over the victory, which they well know is but imaginary, but to make an outward show of loyalty; for it *may* be, they argue, that the cruel tyrant, whom they fear as children the bogie, is on the road towards Magdala.

Time passes on; the King does not come, but instead of this those of the soldiers who can conveniently be spared are collected to resist, it is said, the meditated attack of the Gallas. The chiefs, however, have already spied through the glass that but a few old women are descending the height. They set forward on the expedition, and return in high glee, boasting that the Mussulmen have decamped when the Amharas hove in sight. Lately the same alarm has been frequently repeated, until really a Mohammedan host became visible. All faces assumed then an anxious air; not only was no sortie made, but none felt comfortable until the enemy had withdrawn,—at least for a time.

Indolence is a remarkable feature in the Abyssinian. The continual earnest prayer of the prisoners—at least, of the white ones—is that they may soon be delivered; but the guard have often expressed their opinion that they would much prefer to be imprisoned gytas (gentlemen) like ourselves, with no work and abundance of means of subsistence, than to be poor soldiers. With all this pride, hypocrisy, ignorance, cowardice, and idleness, they have one trait which tends to eradicate any bad impression—viz., the treatment of the prisoners. If one has been so unfortunate as to have been detained in such a capacity near the King, one experiences a comparative happiness to be transferred to Magdala. The petty tyrant in the camp does his best to make one's chains as heavy as possible. It is quite different with the soldier on the Amba; with a moderate amount of politeness and amicable ness, he is to a great extent tractable; but whether the stationary life has contributed to his polish in manners, or whether the continual contact with the captives has exercised a softening influence, I am unable to say. Until the present time, the Abyssinian has been left to himself, with his limited ideas and bad education, always oppressed, and this by the very man who was only a few years back his equal. The doctrine that his property and life absolutely belong to his monarch, makes him servile and hypocritical; that this very despot, who has maltreated the representatives of those civilised powers who tried to benefit him, can do what he chooses without being ever restrained, makes him conceited. But let there be a good government, which respects even the poorest; let him be taught that the little he earns belongs exclusively to himself; give him good instruction, and instil into him sound religious principles; and with his docility, capacity, and, on the whole, equanimity of disposition, these blots in his character will soon vanish.

In reference to the second class, the prisoners, it cannot properly be said that any positive laws are laid down. Old customs have established certain rules which are generally adhered to and respected, but these may at any moment be infringed by the will and caprice of the King. In civilised countries a man must, to be liable to be put under restraint, be a convicted criminal; he must have been condemned as guilty by a legitimate and rational court, on a charge of having violated the persons or property of his fellow-men, or having become dangerous to the state. If now there is an inquiry made—a strict and impartial inquiry—as to the cause why so many persons in Magdala are restricted from taking their share in the transactions of life, it will be found that there are but a very small number who come under the category of culprits; that all the rest can show their countenance to the most punctilious and exacting, and say, without the least scruples of conscience, "Who of you convices me of wrong?" The question remains, why are there so many prisoners? and this I must now explain.

THE LEISURE HOUR.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Couper.*

MR. ASTON VISITS THE CHURCH.

THE MORTONS OF MORTON HALL.

CHAPTER VII.—MR. ASTON VISITS MORTON HALL. THE RECORDS OF THE TOMBS.

MORTON HALL was formerly called Brier Hall, or, more briefly, "The Briers." This name it continued to receive from all the people in the neighbourhood, in spite of the attempt by one of the former owners to give it a title suggested by family pride. In London, and among the county families, it might be "Morton Hall," but on the estate itself the people only knew it as "The Briers," and so we shall usually call it in the sequel. It was an old-fashioned red-brick mansion, of the Tudor

style of architecture, which stood in an extensive and well-timbered park, about two miles distant from the "Wheatsheaf," and at the opposite end of the village. For many generations it had been the seat of a family of the name of Morton, the head of whom was lord of the manor of Fordham, and one of the largest and wealthiest landed proprietors in the county.

It was currently reported that the family might have been ennobled a century earlier, had its chief chosen to accept a title, but that by one after another the honour had been declined, the Mortons preferring to retain the position of simple country gentlemen. From time im-

memorial the county had been represented in the House of Commons by a member of the family, and, in fact, the Tory electors would have considered themselves unrepresented had any other than a Morton of "The Briers" sat in Parliament, on their side, for the county.

Such, at all events, had been the state of affairs in the old days which Mr. Aston recollected; and, long as he had been absent from England, it had never entered his head that any change could have taken place in this respect.

At Fordham, the lately shipwrecked passenger of the Powhattan was once more amid the well-remembered scenes of his boyhood. The old inn in which he passed the night was but little altered from what he recollected it to have been forty years before; and immediately after breakfast, on the morning after his arrival, he set forth to walk to the Hall, persistently refusing the repeated offers of the landlord to drive him in a gig, or any other vehicle he might prefer, and leaving his luggage behind him to be sent for if it were needed.

As he stepped forth from the ivy-covered porch a stage-coach drew up opposite the inn, to change horses as usual. The sight of the stout, red-faced, many-caped coachman and scarlet-coated guard, and the four horses that were led away, steaming with perspiration, to be replaced by four others fresh and full of spirit, and eager for exercise; and the temporary bustle that ensued in the inn-yard among the ostlers and stable-boys; and the deep interest that the idlers and hangers-on appeared to take in the proceedings, which they witnessed twice or thrice every day of their lives—all tended to bring back vividly to his memory the days when he—a boy—had frequently regarded a similar scene with delighted interest. Then he had fancied that the coachman who spent his days perched upon a coach-box, driving from place to place, occupied a position that a monarch might envy; and had looked upon the dashing guard, with his scarlet coat and whistle and key-bugle, with a degree of admiration that he had since failed to accord to generals and field-marshal, glittering with golden and jewelled orders.

He looked into the faces of these men, almost inclined to fancy that he would recognise features that he remembered of old; but, though the scene and its accessories were those of olden times, the guard and coachman were not the heroes of his boy worship. The many-caped coat was worn on other shoulders, and the key-bugle had passed into other hands; and he turned away to gaze again upon the familiar scenes by which he was surrounded. Near the inn, on a slight eminence, a short distance off the high-road, stood a huge elm-tree, that, according to village tradition, had grown to its vast girth from a slender sapling that, in accordance with the barbarous practice of former days, had been thrust through the body of a suicide. The tree appeared to him to have grown no larger and no older than it was when, forty years before, he had been whirled rapidly past it on the outside of the stage-coach that bore him away from the home that he was never to return to, as to his home, again.

The old village legend flashed to his memory—legend half scouted, half believed—that at certain seasons of the year, and at the midnight hour, the ghost of the suicide came forth from the tree, and passed round and round the huge gnarled trunk, doing penance for the crime committed "in its days of nature;" and he remembered how, when a schoolboy, he had shuddered on those occasions when he was obliged to pass near the tree after dark, lest it should chance to be one of the

ghost's penitential nights, and he should see it gliding its lonely, weary round.

As he passed by the various objects on the roadside, the cottages in the village, the old ivy-covered church, with the two clipped yew trees in front of its porch—so exactly alike in size and shape, and growing so lovingly together, that those whose eyes rested upon them might recall the words of the pastoral poet, and exclaim, "Here Glaucis, there Philemon grew"—the school-houses, and the wide common beyond, each and all, as one after another they opened to his view, came back to his memory as vividly as though he had quitted the village but yesterday. The men at work in the fields, the women and girls at the cottage doors, gazing in wonder at the unwonted appearance of a stranger; the children playing in the village street—everything appeared as it appeared in days gone by.

One thing alone was changed. Men, women, and children were alike strangers to him, as was he to them. He sought in vain for the old familiar faces. These had passed away, to be seen no more.

At length he came in sight of the Hall. The park-gates stood open; and, though he hesitated a few moments to consider whether he should pass through them, or first make inquiries at the porter's lodge, he eventually decided to enter the park.

A woman stood, with a child in her arms, at the window of the lodge, and gazed curiously at him as he passed by, and again for a moment he forgot the lapse of time.

"Can that be old Deborah?" he thought to himself; but, when he caught a glimpse of the woman's face, he smiled at his own folly, and muttered half aloud—

"How foolish of me! Deborah was an old woman when I was a child."

A broad chestnut avenue led from the lodge to the mansion, some furlongs distant; and as he passed between the rows of magnificent trees, now denuded of their foliage, it seemed to him as if they had remained unchanged since the days when he had played beneath them, a careless child. He caught glimpses of the park between the huge trunks of the trees, and the prospect appeared as familiar to him as though he had seen it yesterday. One scene recalled another to his memory, until every incident of his boyhood recurred to his mind. He felt like a man who has been suddenly awakened from a deep sleep, or as if his past life had been one long troubled indistinct dream from which he had just awakened to the reality of existence. Still passing onwards, he came to a sweep in the broad avenue which brought him opposite the mansion, and he now perceived that the greater portion of the shutters were closed.

For a moment he stood as it were confounded.

"They have left for London, then, in spite of the snow-storm," he muttered to himself, in a tone of deep disappointment. "I have undertaken my journey to no purpose."

For a brief period he hesitated whether to return to the inn or to go on to the house and make inquiry of the servants, some of whom would have been left behind; and had just determined on the latter course, when an old man, in the garb of a gardener, emerged from a thicket of shrubbery near by, and began to shovel the snow from some flower-beds. He walked towards the old man, who, however, took no heed of his approach until he stood at his side, when, looking up and seeing a stranger, with the appearance of a gentleman, he touched his hat, and said, in a broad Scotch accent—

"A braw mornin', sir, but cauld, unco' cauld for the

season. The spring's lang o' comin' the year. What's your wull?"

"It is indeed a sharp morning, my friend," replied Mr. Aston to the first portion of the old man's speech. "You, I presume, are the gardener?"

"Just sae, sir; and my guid wife keeps the lodge awa' yander. Ye'll maybe hae seen her gin ye cam in at the yett?"

"I saw a female with a child in her arms standing at the window."

"My wee gran'child, sir, and as bonny a bairn as ye suld wuss to see onywheres."

"From the appearance of the house," continued Mr. Aston, glancing at the closed shutters as he spoke, "I see the family are absent?"

"They gaed up to Lunnon yester-morn; ilka ane o' them, sir—t' auld squire, my leddy and a' the weans, forbye maist o' the sairvants. There's nane left ahint forbye mysel' and t' auld housekeeper, and another body or twa."

"So I feared, and I'm sorry to hear it. I came from London purposely to visit them. Are they likely to remain long in London?"

"Maist o' the spring, I reckon, sir. Ye'll just hae to win back to Lunnon gin ye wud see the squire special; but gin ye wud just gang o'er the grounds, 'tis nae sae muckle odds. I sall tak' plesure in showing ye roun' my ain sel', though there's nae muckle tae see at this time o' year."

"I wish to see Mr. Morton and his family, any or all of them who are still living. I have seen none of them for many years, and I suspect, my friend, that he whom you call the old squire was a young man when I last saw him. However, there's no help for it. I would rather have met them in the old house; but, as you say, I must just return to London. You, I presume, or at any rate the housekeeper, can furnish me with Mr. Morton's address in London?"

The old gardener stared at the stranger while he was speaking; and when Mr. Aston asked for Mr. Morton's address in London, he replied—

"I'm thinkin', maister, ye're no speakin' seriously, tho' it's ill jokin' o' dead folk. Ye'll just hae to gang till the kirkyaird, or till the chauncel, whilk is much the same, to find Squire Morton and a' his familiee. I dinna ken ilka other familiee o' the name hereabouts. Leastways I never heard o' siccan a name forbye t' auld familiee that's a' dead and gane. Squire Foley leevies at the Briers the noo, and has leevit here these twenty years and mair. The Foleys, ye ken, gin ye're acquaint wi' the familiee, is far awa' cousins o' the Mortons, and when the Mortons a' died aff Squire Foley came intil the Ha' and the estates. A gran' thing it was for him, gin a' I ha' heerd be true, for folks say the fam'lee was unco' puir and unco' proud. Pride an' puirtith, ye ken, after gang thegither, though they're no weel matched. But it does na become me to say ought o' siccan matters, sin' it was before my time."

The loquacious old gardener might have talked on for half an hour without interruption from Mr. Aston, who was so utterly astounded that he stood as if he were thunderstruck. The cessation of the old man's voice, however, recalled him to himself, and he replied—

"My good man, you must—surely you must be mistaken. My—the old gentleman, I mean—old Squire Morton I did not expect to find still living; but Mr. Edward, and the Captain, and the daughter Mary, surely they, or some of them, or their children, must be still living. It cannot be—it seems incredible—that the entire family are dead."

"I ken nae mair nor whaten I hae tauld ye, sir," replied the gardener. "Squire Foley's been maister o' the Ha' for twenty year an' mair. *That* I ken fit' weel; but gin ye wud larn mair, ye maun just speer o' t' auld housekeeper. But it's aye the truth I'm tellin' ye; an' mair by token, gin ye'll just win awa' till the kirk, ye'll see the stanes set up i' the chauncel, and the tombs i' the kirkyaird, that will tell ye the dates o' their deeths."

"I will see the housekeeper," said Mr. Aston. "Thank you, my friend, for your information," he added, at the same time giving the old man a shilling, "though it has caused me grief and disappointment."

"The man's clean daft," muttered the gardener, as he watched the visitor on his way to the front door of the mansion, "speerin' after folk that have been years in the grave. Gin it had been nicht, I suld ha' thoeh't he had been a ghaist himsel'; but he's a discreet, ceevil body wi' a'. 'Tis na ilka ane wud gie a body siller for speakin' just a ween sair words." And as Mr. Aston was admitted to the house, the old man resumed his work.

The housekeeper was aged and deaf, and from her nothing more could be learnt than had been already learnt from the gardener. She, however, corroborated the old man's statements; but added that she knew nothing of the Mortons beyond what she had heard from her master and mistress, and from the gossips of the village. She had been in the service of Madam Foley since she was a young woman, and had come to Brier Hall with the family, after the death of young Squire Morton.

Finding that he could obtain no more information from the other servants, who were young women who had been but a few years in service, Mr. Aston quitted the house, and sick at heart, disappointed, and depressed in spirit, returned towards the village.

Between the village and the Hall stood the old church which had seemed so familiar to him as he passed it an hour before. The door was open, and when he stood in the aisle he looked around for the sexton or pew-opener whom he expected to find inside. No one, however, was to be seen, and he proceeded to the chancel, the walls of which were covered with marble tablets to the memory of several generations of long-departed Mortons. He recollected how often in his boyhood he had looked upon these memorials of the departed, and had read the inscriptions thereon, half in awe and half in wonderment, and he remembered that in those days there had been one, and only one, vacant space on the walls.

That space was now filled up; and, with a sad heart, he read the inscription on the tablet, which ran as follows:—

"Sacred to the memory of Edward Morton, Esquire, late Lord of the Manor of Fordham, who departed this life on the 4th of April, 1783, *ætat.* 75 years."

Adjoining this tablet was one that he had often seen when he was a child—one that had been more mysterious to him than all the rest. It was inscribed—

"Sacred to the memory of Mary Morton, the dearly-beloved and deeply-lamented wife of Edward Morton, Esquire, who departed this life to enter into eternal rest, in the faith and hope of Christ, June 7th, A.D. 1776, *ætat.* 45 years."

He remained a long time gazing upon these melancholy memorials, and then turned away, with a sigh, to seek elsewhere—since the chancel was fully occupied—for the records of death's doings that he had been told he would find; nor had he far to seek them. Near the church porch, and beneath the shade of the venerable

yew-trees already alluded to, stood a monumental tombstone, enclosed within railings, and on the facing of the stone was inscribed—

"Sacred to the memory of Captain Charles Morton, second son of Edward Morton, Esquire, and late of H.M.'s 20th regiment, who fell gallantly fighting at the head of his company, at the siege of Gibraltar, Sept. 13th, 1782, *ætat.* 25."

And beneath the above inscription, on the same tablet—

"Also sacred to the memory of Edward Morton, eldest son of the late Edward Morton, Esquire, and late Lord of the Manor of Fordham in his own right, who departed this life March 2nd, 1785, *ætat.* 33. *Requiescat in pace.*"

"Poor Edward! Poor Charley!" sighed Mr. Aston, as he turned away, after having perused the inscriptions. "Dead more than thirty years! Still, I do not see any proof of Mary's death," he muttered to himself. "She may be still living. She was younger than I. Ay, if it be so, I shall find her, and that will be some consolation."

Hopeful, yet still dreading lest he should come across a tombstone that would record the decease of Mary Morton, he searched the little churchyard from end to end. But there was none that recorded the death of such a person; nor the death of the daughter of the former, nor the sister of the late lord of the manor, under any other name.

"She would surely have been buried here, if she were dead," he muttered. "She cannot be dead. I shall find that Mary has married, and is living elsewhere. Now I think of it, the gardener, though he spoke of the death of all the Morton family, did not speak of the daughter of the house. The estates would pass away in default of male issue, and the old man may not have known that the late lord of the manor had a sister."

Notwithstanding the shock he had received, Mr. Aston derived some consolation from the fact that the churchyard contained no record of Mary Morton's death; and, with a somewhat lightened heart, he returned to the "Wheatsheaf" inn.

CHAPTER VIII.—THE CHANGES EFFECTED BY TIME.

It was a dull evening at the "Wheatsheaf." No new guests had arrived during the day; no travellers had alighted from the last stage-coach that passed by the inn; and when Mr. Aston (who had retired to his room on his return from Morton Hall, to brood over his disappointment) came down to the coffee-room, he found it entirely unoccupied. He was dull and dispirited, and felt the want of society, and the thought struck him that he would call in the landlord, and endeavour to glean from him some information respecting the people of the village.

The landlord was very communicative, but when asked about the Mortons, and especially as to his knowledge of what had become of the daughter, Mary Morton, he could give no information. "Squire Foley," he said, "was in possession long before I took the 'Wheatsheaf,' twenty year ago, and I know nothing of the old family."

"You must have heard something of them from the people of the village, and the neighbouring farmers, who were for so many years tenants of the Mortons?"

"I have heard, sir, there were great changes when the new squire took possession. You see, sir, most of the land about here belongs to the Morton Hall estate, and, when the leases expired, I've heard that Squire Foley raised the rents, and put a lot of strangers in.

Same in the village, sir. Most of the old folks be dead, or gone away. Things have gone different to what they used in the old squire's time. I pay ten pound a year more for the 'Wheatsheaf' nor my uncle did, who kept it nigh on to thirty year."

"Then you can tell me nothing of Miss Morton?" said Mr. Aston, in a tone of disappointment.

"Well, sir," replied the landlord, "I can just mind hearing how Miss Morton, as was, got married a year or so after her brother's death, against Squire Foley's will, folks said—he bein' her guardian, ye see, sir. And I have heard—though, seein' as the squire's my landlord, it don't do for me to talk of such things, which may be mere village gossip, seeing the new family ain't liked—but I have heard that Squire Foley had a sort of hold on the young lady, and didn't do exactly the right thing by her. At all events, she went away with her husband, and neither on 'em have been in these parts since. So, you see, sir, the lady may be livin' or may be dead, for aught I can tell."

"What was the name of the gentleman whom she married?"

"That I can't say, sir, though I have heard it; but I mind that he was a young navy officer who was visiting in the neighbourhood, and folks said he was poor, and that was why the squire objected to the marriage. Howsoever, they were married private, and—you'll not let on I told you, sir—but they say the young lady was entitled to a good deal of money, which the squire, being her guardian, kept from her."

"Nothing that you have told me shall be repeated to your injury," replied Mr. Aston. "But surely," he went on, "there must be some of the old residents of the village or neighbourhood who can give me the information I seek? The old rector, Mr. Whitney, I knew him when I was a youth; but I suppose the old gentleman is dead?"

"He's been dead ten year, sir; Mr. Danton be the rector now."

"Let me think. Ah, there was Cook, the surgeon. He was but a young man when I knew him. He may be still living?"

"Bless your heart, sir, Mr. Cook died, quite an old gentleman, six year ago."

The miller, the postmaster, the general shopkeeper, and several others among the superior class of the villagers, were successively mentioned by Mr. Aston; but all, he was told, were either dead, or had long ago quitted the village.

"Dead, or gone—dead or gone!" he repeated, sorrowfully. "It would seem indeed that death has reaped his harvest here, during my absence; and I was foolish enough to fancy that I should find people as I left them, a boy, forty years ago! I never, until now, realised the length of time that I have been away, or the change that has taken place in myself."

Mr. Aston spoke rather to himself than to the landlord; but the latter, who had listened to him with curiosity and astonishment, said inquiringly—

"You appear to have known Fordham well years ago, sir?"

"Well," was the reply. "I was born near the village. Thirty-nine years ago, this very month, I sat with my father in this room, awaiting the stage that was to carry me to London. The 'Wheatsheaf' was the last place in the village that my eyes rested upon. Little did I then think that so many years would pass ere I should see it again. Little did I dream of the changes that would occur in the village and its neighbourhood ere I again returned to it. And yet the village itself is little altered;

and the old inn appears to have remained entirely unchanged."

A brief silence ensued, during which Mr. Aston remained apparently buried in mournful thought, from which he was at length aroused by the landlord, who said abruptly—

"I've been thinking, sir, that since you seem to have known so many of the old folk of the village, mayhap you might remember old Matthey Budge—him as was parish clerk and sexton for so many years?"

"Old Matthew Budge? To be sure: I knew the old man well. But he was an old man, in my estimation, when I was a child! You don't mean to tell me that *he*, of all others, is still alive?"

"Old Matthey, sir, is living and hearty; that is, for a man of his years, and he's well-nigh a hundred year old. He can tell you all you want to know about the old family at the Briers, for he minds things as happened long years ago, better than things as took place last year."

"Is it possible that, at his great age, his faculties are still perfect?"

"Well, sir, the old man's eyesight is some'at dim, and he's a bit deaf; but, speak to him of times gone by, and he brightens up wonderful. I've heard that old Matthey was quite a favourite of old Squire Morton's, sir."

"I must visit the old man. Where does he live?"

"In the same old 'thacked' cottage, sir, as I've heard say he were born in, and his father before him. Squire Morton left in his will as the old man was to live in it, rent free, until the day of his death."

"I must visit the old man," repeated Mr. Aston. "The cottage stands near the common, if I recollect aright?"

"On the common, just beyond the church, sir. You must have passed it to-day, on your way to the Briers?"

"I did; but I little thought old Matthew Budge was still living in the cottage. I will call there to-morrow."

The landlord, growing chatty over the wine, of which he had needed no pressing to share, amused his guest until the hour at which he went to rest came round, with a variety of village gossip relative to the family at Morton Hall, and other resident families of the neighbourhood. When Mr. Aston had gone to his room, and the "Wheatsheaf" was closed for the night, a long discussion took place relative to their guest between the landlord and his wife, who could not make out who the gentleman could be who had evidently known the village and its residents so well of old. They knew the names, not only of the gentry of the neighbourhood, but also of most of their visitors; but the name of Aston was strange to them, and they thought it singular that a gentleman whose name they had never heard mentioned by any of the villagers should have been so familiar with the old family at the Hall. However, the discussion came to nought, and they were obliged to wait for time or chance to explain the mystery.

"OUR OWN CORRESPONDENT."

Who is the mysterious and apparently ubiquitous functionary that figures every morning under the above designation in the columns of the newspaper, few people comparatively have any very definite notion. We accept the information he sends us as though it were a matter of course, and in stirring times we look for it hungrily and devour it eagerly, but are apt to waste little thought upon the painstaking person who

devotes himself to the gratification of our curiosity. For the benefit of general readers we shall jot down a few particulars concerning him, from which they may gather in some measure the extent of their obligations to one who, whether he be ignored altogether or justly appreciated, ought to be regarded in the light of a public benefactor. The qualifications of Our Own Correspondent have risen amazingly during the life of the existing generation. We can recall the time when, as regarded the majority of English newspapers, he was a mere myth—a *nominis umbra* perched at the top of a column, but perched nowhere else unless it was on the high stool of the editor's "sub," and giving forth his utterances through the medium of rather questionable translations. All that is changed now. The Own Correspondent of to-day is the best man that can be induced to undertake the arduous duties which devolve upon him, and which, it may be truly said, he can at the best but perform in part. He ought, in the first place, to be a practical politician, versed in the current Continental predicaments and tendencies; he should be a thorough man of the world, endowed with sufficient *savoir-faire* and self-confidence to feel at home in the first society; and he should be energetic and enterprising—capable of instantaneous decision when decision is required of him—fearless of peril on the road or in the battle-field—and ready and fertile of resources in all cases of emergency. Even with all these rare qualities he will be nothing unless he have a faculty of observation rapid and comprehensive enough to seize upon everything that comes in its way, and sufficient volubility with the pen to chronicle all events as they take place, and pourtray all circumstances at once with a fidelity not to be impeached, and sufficient graphic effect to render the perusal of his despatches interesting and agreeable. If he is not of too refined a *morale*, so as to be over-scrupulous in the adoption of means for obtaining information, it may be none the worse for him in the estimation of the news-devouring public. We are not speaking now of the regular correspondent, who, residing constantly in some foreign capital, gleans from the officials of the Government such information as they choose to impart, and as much more as he can; but of him who is the special messenger of the London press, and is ready to start to any quarter of the globe at a moment's notice.

Receiving his instructions from "the management," Our Own sets forth on his journey, well provided with funds, and with numerous letters of introduction to persons in power, who may be able or willing to assist him in his function. He may be despatched incognito to some secret congress or quiet meeting of potentates, great or small, where certain questions of diplomacy are to be discussed in a manner under the rose, but the results of which the London editor has determined, if possible, to make public. In such a case, if the Correspondent were to declare himself he would defeat his own purpose, and, if not sent to the right-about at once, would be so closely watched as to render his success impossible. But he does not declare himself: perhaps he assumes the character of an invalid, perhaps he is a student acquiring the language, or he is an idle traveller making but a temporary sojourn; but in either character, or in any character, he manages to make friends, or to improve his introductions into friendships, and in course of time seeks out the heart of the mystery it was his business to fathom. Or he is despatched to some district on the eve of insurrection, or already in the throes of revolution. He must not think of the danger—he rarely does think of it. If the place is unapproachable

by the ordinary routes, if the roads are stopped by insurgents, or the railways torn up or in hostile hands, he mounts on horseback, and, hiring a guide, dashes across the country to the point of action. This may be the very seat of war; and if it is, so much the better for him, as his despatches will be all the more interesting and valuable. At times of special turmoil he is known to get through an incredible amount of work, being on the alert all day to catch everything worthy of note, and sitting up half the night, or the whole of it, to finish his voluminous despatch in time for the post or the express. All his motions are governed by the management at home; he is too expensive a machine to be allowed to stand idle or to waste his energies on matters of trifling importance. When he has used up one place he gets orders to be off to another. Thus, he may be in Russia one day, shivering almost at zero, and after a brief interval sweltering under the hot sun of Spain or Italy; and a month later he may be bound for India, or on the voyage to China. Wherever he is, unless when on board ship, he has his work to do, and plenty of it, for his despatches will be looked for at home, and must be as regular and frequent as possible. Much that the travelling correspondent writes is lost in its transit homewards; and the wonder is that more is not lost, looking to the rupture of communication incidental to conditions of revolution and warfare.

An "Own Correspondent" who published his autobiography about fifteen years ago, gives some curious particulars as to the means by which information is sometimes gained. Thus, he mentions that at the siege of Milan by the Austrians, the Italians within the walls sent intelligence of everything of import that occurred to their friends without, by means of small balloons, which, wherever they fell, were forwarded to the committee of observation at Novara. The exploits of this adept throw considerable light on the nature of the profession, and some of them are sufficiently instructing as well as amusing. The following may serve as an example. He was sent to the Congress of Töplitz, which was proclaimed to be merely a festive meeting of European sovereigns, but was suspected to be something very different, and he was instructed to leave no means untried to get at the real facts of the case. Arrived at the place, he found himself worn-out with travel, without a friend to appeal to, and unable to speak a word of German. Nothing daunted, by way of executing his important commission he took to his bed, and sent immediately for the royal physician, who spoke English well. The physician could find no symptoms of disease; but the patient complained of cramps, and gave him a double gold Napoleon at every visit, only insisting that the good man should stay with him for a quarter of an hour or so when he came, to be at hand in case the cramps should return. The patient led the unsuspicious doctor into conversation, and, assuming the simplest ignorance, drew him out on one topic after another. By and by the talk turned on Töplitz and the fine company with which it was filled, the patient asking innocently whether the town was always so gay. Surprised that he had heard nothing of the Congress, the doctor plunged into that fertile topic, telling the names of all the royal personages present and expected; what was the ostensible and what the real object of the meeting, and illustrating all he said by references to his illustrious patron the King of Prussia. In this way he talked till he was tired, and then he took his leave, not without his double Napoleon fee, and an appointment to come again to-morrow. "No sooner," says Our Own, "had the doctor's carriage cleared the court-yard, than out of bed I jumped, sat down to my writing-desk, and

out of his conversation composed more than one opening letter, in which I took care to say nothing that could compromise him, or reveal the source from which my information came. . . . The next day the excellent medical adviser returned, and in the same manner unwittingly supplied me with fresh matter; and as I procured a cicerone at the same time, who knew all the great people and their titles, I felt myself as much at home in forty-eight hours as if I had lived the whole season at Töplitz." Thus it was that the depth of that diplomatic mystery was plumbed, to the immense astonishment and gratification of the politicians of London, who learned suddenly from the columns of the "Morning Herald" facts of the first importance, of which, till then, the editors of all Europe were in profound ignorance. This happened in 1836; the Congress, as some of our readers may recollect, having been summoned by the Emperor of Austria, to consider whether any and what steps should be taken for aiding Don Carlos and Don Miguel against the Quadruple Treaty.

A far more cunning and audacious exploit was achieved in 1848, by the same hand, who was then in the service of the "Times." The Portuguese Chambers had not been called together for three years; but they were now to assemble on a certain Monday, and there was the greatest anxiety prevailing, both in Lisbon and London, to ascertain in what terms the speech from the throne would speak of the home policy of the Government. It happened perversely that the mail-boat, which left for Southampton only once in ten days, would start on the previous Saturday; so that there would be eight days to wait for the next post. This did not suit Our Own, who resolved to send home by the Saturday steamer the unspoken speech of the Monday. He set to work accordingly. By dint of coaxing, and liberal promises, and doubtless the usual etceteras, he won over to his interest certain persons in close attendance upon the Queen. From one he obtained some words of importance agreed to at the council. Armed with these, he was able to persuade another that he was in possession of all that was material in the speech, and that all he wanted now was merely a copy of the exact words. The copy was promised him, but the promiser would not deliver it till half-past three, by which time, as he (or she) knew, the mail-boat must be off, in order to tide it over the bar. But before sailing time Our Own had seen the captain of the steamer, and arranged matters with him. The vessel sailed before three; at half-past three the speech was forthcoming, and in half an hour more was being translated by Our Own himself in the cabin of the steamer, which had awaited him in the offing, and sailed off with its precious missive before six. When it appeared in the "Times" of the following Wednesday, all London set it down as an invention; but, on its arrival in Lisbon on the Sunday, it raised a commotion and hubbub without parallel. The court and the ministers were indignant beyond measure, and the British Legation, dumbfounded, knew not what course to take. Our Own took the matter in his peculiar way, confessing nothing and denying nothing, talking of balloons and air-currents, and hinting at chartering a grampus or the sea-serpent for his next express. They could get nothing out of him but blarney (he was an Irishman), and they had to put up with the grievance.

The use of the electric telegraph, now so general, has much modified the function of the travelling correspondent. Great events are now flashed from country to country in a few words, and we look to the correspondent rather for graphic details and attendant circumstances than for the earliest information concerning

facts of national importance. The Own Correspondent of to-day is far less an impersonality than was his predecessor even of twenty years ago. That change in the literary likings of the public, which is marked by so decided a preference for the objective, has affected even him, and he now writes less as a politician and more as an observant traveller; and, so doing, writes more acceptably to the public. The change has not at all lessened the perils of his vocation. The search after interesting detail leads him to face dangers of every kind. On the theatre of war he will pass hours or days under fire; he will join any expedition, whatever the risk, finding compensation in the material he can collect for perils however great. The advantage of this to the general public requires no pointing out. We do not so much *hear* of the stirring events which take place abroad, as *see* them through the optics of the correspondent. We travel with him on his devious round, and share the excitements of the way; while, knowing everything through his minute and faithful reports, we need not accept his conclusions, because he furnishes us with the means of arriving at our own.

The responsibility of the correspondent has vastly increased of late years, and as one result the post has been filled by men of a higher class. It is recognised that, to a great extent, it is they who furnish the materials for future historians; and it is felt, therefore, that they cannot be too diligent in the collection and verification of facts, or too scrupulous in literal adherence to the truth. The value set upon these communications was illustrated during the Crimean war, by the eagerness with which the despatches of Mr. Russell were expected, and the unabating interest with which they were devoured. No man who sets about writing the history of that war could get on without these documents, which contain living pictures of everything of note that occurred, but which the newspaper correspondent alone chronicled on the spot. The same gentleman, it will be remembered, accompanied the North American army in its campaigns against the South, until he was stupidly dismissed by the commander-in-chief. He was further present at Sadowa, where it may be said he was almost the only man who viewed that tremendous battle in its entirety, and where, with an observation more than lynx-eyed, he took in the details of that famous description which we all remember, and which has since become the basis of the Prussian history of the campaign.

In the matter of correspondence from abroad the illustrated newspapers are often at a double charge, inasmuch as they have to send out a pictorial correspondent as well as a literary one. The artist imperils himself quite as much as the writer, and at times even more, because when he is busy with his sketch he remains a fixture, and is for so long a mark for any keen-eyed rifleman's aim. The late Mr. Julian Portch, a young artist of great promise, used to narrate some striking bits of adventure which were parts of his experience while he was sketching at the siege of Sebastopol for a pictorial paper in London. One day he was in the trenches, getting on with a full-page picture. He sat on his camp-stool, and as he looked down into the besieged city he could watch with his glass the movements of a little man, who, at the head of a party of gunners, directed the charging of a huge mortar, which, every time it was fired, sent a thirteen-inch shell right up into the trenches of the English—a distance of near two miles—the little man always adjusting the piece for the aim, and firing it himself, not without some rather theatrical antics and airs of defiance. When the mortar was fired the men in the trenches would look out for the

projectile and mark the direction it took, and, of course, those who were in its vicinity when it was near would betake themselves to the holes and shelters provided for them, and there remain until it had burst and the danger was past. One morning, while busily touching up his work, P. was startled by loud shouts of "Jemmy! Jemmy! Singing Jemmy!" uttered close to his ear. He immediately sprang up, knowing that Singing Jemmy was the monster shell, so called from the hissing noise it made in rushing through the air. In his haste to get out of its way, he rushed, headlong almost, into another man's hole, mistaking it for his own. He had hardly got himself snugly ensconced when the right owner of the refuge rushed at it too. There was barely room for one person, and there was no time to seek another shelter, for Jemmy was singing disagreeably near overhead. The soldier jammed himself close to the artist to shelter as much of his person as possible. Down came Jemmy, and burst with a roar that well-nigh deafened them, and in bursting threw up, together with a volcano of mud, a huge fragment of something which struck the soldier heavily in the back. The poor fellow turned white as a sheet, and then of a livid hue, and would have fallen had not P. caught and supported him. On looking for his mortal wound, however, all the damage that could be discovered was confined to his garments, to which the muddy soil clung in a mass; the fragment which had struck him was nothing more than a portion of the sod torn up by the bursting shell, and which, though it had almost knocked the man's breath out of him, had really done him no injury beyond the momentary, though terrible, fright it had occasioned him. The incident, though treated at the time with some levity, was remembered as a providential escape, and shows well the perils sometimes undergone by "Our Own Correspondent."

SALMON AND TROUT EGG COLLECTING.

BY FRANK DUCKLAND.

I AM happy to find that the new and important science of fish culture is attracting increased public attention in England. I am always pleased to take any opportunity of making the matter better known among my countrymen, and therefore gladly pen the following remarks.

Fish culture is of two kinds. Firstly, it consists in allowing the fish, salmon especially, to have their own way, assisting them over weirs, through mills, and other obstructions, and then preserving them against poachers by means of water-bailiffs and river-watchers while they are making their nests in the small tributaries of the main streams. Secondly, salmon and trout may be cultivated artificially, that is to say, their eggs may be taken from them, and hatched in troughs, in running water, under the superintendence of man.

After many years' careful observation, I have no hesitation in saying that the natural mode of cultivating a river (especially in the case of a salmon river) will be found far to supersede the artificial mode. The latter, nevertheless, is of the greatest possible service when the former cannot be put into execution, and it also enables us to transport large numbers of salmonidæ, packed in the form of vivified eggs, for very long distances, when it would be utterly impossible to convey the living fish themselves. The transport of salmon to Australia is a good case in point.

The eggs of the fish are the hard roe, and each fish carries an amazing quantity of eggs. In the herring, for instance, I find that there are no less than 19,840 eggs;

in the mackerel, 86,120 eggs: so that the reader will have the satisfaction of knowing, when he or she eats a hard-roed herring for breakfast, or a hard-roed mackerel for dinner, that he or she will have destroyed the above numbers of herrings or mackerel, as the case may be.

The salmon and the trout, on an average, carry one thousand eggs to the pound of weight; that is to say, if a trout weigh one pound, it would carry about 1,000 eggs; if a salmon weigh twenty pounds, it would carry about 20,000 eggs; and yet, so many are the enemies of the young salmon and trout, both in the egg and infantile state, that it has been calculated (from the Tay fishery returns) that in order that *one fish* shall be caught in the net, from one to three thousand eggs must be laid by the parent fish.

The principal dangers to trout eggs are floods, which sweep away and destroy the nests of gravel in which they are laid; mud, which covers them up; ducks, which destroy them by thousands; the parent fish themselves; besides many insects, to which they are dainty morsels. The water ousel, or water crow, is said to eat these eggs. I feel convinced it does nothing of the kind. It is purely an insectivorous bird, and its business on the salmon nests is to destroy the insects that eat the eggs. It is, in fact, as clever policy to shoot the swallow for flying over the turnip fields, in order to eat the insects that destroy the turnips, as it is to shoot the water crow. The swallow does not eat the turnips; the water ousel does not eat the salmon eggs; both birds eat pernicious insects.

We are enabled, by the means of fish artificial culture, to preserve the eggs from many of their dangers; but before we can do this we must *get the eggs*; and this is a very difficult task. Many good folks would really seem to imagine that salmon and trout eggs can be as readily taken from the parent's nest as hen's eggs can be from the hen-roost, and they feel annoyed if they do not get their promised supply of eggs; let me, therefore, explain a few of the difficulties of egg collecting. In the first place, the fish must be caught; and my experience tells me forcibly that the fish have great objections to be caught. Again, they make their nests and lay their eggs in the depth of the winter, and often when it is excessively cold. I have frequently, when egg collecting, come out of the water with my net, and, having laid it on the bank to drain off the water, have found that in a few minutes it would become frozen as hard as the wire netting used to fold sheep. No one, therefore, should think of undertaking the task of egg collecting if he cannot stand cold. This work, moreover, is so uncertain, that the *master must do it himself*, or it will not be done at all. Gamekeepers and water bailiffs are good sort of fellows, but they do not care to work six or eight hours over their hips in a rapid stream, with the water a little above freezing point. Nor are they energetic enough, in the first place, to recognise, and secondly, to hunt for one particular trout, upon obtaining whose eggs the success or failure of the day's sport may depend. Moreover, a great deal of patience and ingenuity must be set to work to catch the right kind of trout.

I generally begin my work as soon in the early morning as it is possible to get the men together. I never think of walking up the bank of a river; for the trout, in clear water, are excessively artful and shy, and if they saw me, or heard footsteps, they would be off in a moment. Having ascertained where the best spawning bed is in the river, I walk near to it, and then, getting close to the bank, go on my hands and knees, and peep over to see what is going on. If there are a good number of fish at work on the bed, I signal to the keeper

who is on the other side of the stream; he then throws me a rope across, and I gradually drag the net right across to my side. Please remember that the first net should always be drawn across the stream *below* the fish; if drawn across above them, it is apt to belly out, make mud, and disturb them. The net below being fixed with the greatest possible care and celerity, I haul the second net across the river above the fish; this done, I rest a minute previous to commencing serious business. The best thing to do next is to take a run and jump right into the middle of the river, all among the spawning fish. In a moment they fly all over the place, and the chances are that half of them are in the net before they know that anything is wrong. On one occasion, in this manner, I caught thirty-six trout in the lower net and twenty-one in the upper, and in an hour or two after arrival at the river side we had filled our cans with eggs and were on our road home again. This, however, was a piece of good fortune which occurs very, very seldom; more often than not, one has to walk miles and miles all day long, and perhaps not get more than three or four thousand eggs after all.

One of the most curious things about trout egg collecting in the winter is the enormous number of male fish, compared to females, caught in the net; there are always seven gentlemen to one lady, and often the proportion is even greater. There are two reasons for this: first of all, nature seems to have ordained that there shall be more male than female fish; and, secondly, the male fish are certainly more silly than females, for the instant a splash is made in the water the males charge, all steam up, right into the net, and there kick and struggle like brave fish. The females, on the contrary, slip away somehow.

Having caught the main body of the fish from the spawning bed, the next thing I do is to go into the water to see what I have caught in the net. The engraving (from the pencil of Mr. Briscoe) will give some idea of the scene. We have just got a netful of fish, and the man on the right-hand side is going to take them out; that man is your humble servant in his winter "get up." The figure by the tree is my trusty assistant, Neville, all ready with the egg cans and spawning-tins; the people in the distance are beating the river to drive down any fish that may have escaped the net. The state of the trees will indicate the time of year. In the distance can be seen Lord Portsmouth's mansion at Hurtsborne Park, Hants, and the waterfall at the end of his lordship's beautiful lake.

As I said before, I am sure to find a large number of males in the net, and comparatively few females. Leaving the captured fish safely in the net, where they will not die whilst in the water, I at once institute a search for the ladies. Walking *up* stream, I go into the weeds which grow between the nets, and, baring my arms, bring my hands gradually together with the fingers outspread; in a minute or two I am pretty sure to touch the back of a trout with the tip of one of my fingers. At this moment great caution is necessary, or the fish will be off like lightning. I then catch the fish; but how this is done I am not going to tell the reader, for if I were to tell him I doubt if he could (like playing the fiddle) do it without much practice.

Having searched all the weeds, I then search under the hollow banks—a pretty sure find for fugitive fish; the "bolt-bolt hole" of a water-rat, situated under the water level, is a very favourite place for a frightened trout, as she will often run her nose quite into the hole, with just only her tail protruding; this, however, is quite sufficient for me: if I can only feel her tail she is

generally mine. This searching for lady trout which have hidden themselves is the coldest part of the work, as one is very often tempted, in order not to lose a fish, to lower oneself so deep that the water runs down over the waterproof dress.

way. This archway was scarcely large enough to allow a man to pass up; it was half full of water, and, as we could not quite close the hatch above, a constant stream of water was running through. Knowing that, if I did not get these fish, we should go home without any eggs,

TROUT EGG COLLECTING.

I will here describe the proper dress, viz.: a pair of indiarubber overalls,* reaching up to the armpits: these are drawn over the usual attire; woollen socks are worn over the feet, and a thin pair of boots. It is a great mistake to wear thick boots; they should be, on the contrary, very light, as it may be often necessary to run a hundred yards at full speed. It is a bad plan to wear thick flannel: if you go in head over ears it will hold the water all day; thin flannel can be easily wrung out. I have made it an invariable rule the last five years, to anoint myself, before going out in the morning, from head to foot with scented hair oil; I took this hint from the Esquimaux, who use oil largely in their fishing excursions. I carry with me a small bottle of this oil, and when about to get a trout from a rat-hole, or other deep place, give the arms and hands a good rubbing with it. It is to the use of this oil that I attribute my perfect immunity from rheumatism or colds; it prevents the warmth of the skin escaping into the water. The work all done, I sometimes make my toilet in queer places: in a stable, or under a hedge; once in an open trap, on a bleak Hampshire common, the horse galloping as hard as he could, so as to catch the last train for London. It is a very bad thing to use any spirits while at work, but a glass of very hot grog when the work is over is most acceptable. Never forget a sealskin cap lined with wool: it keeps off the snow from the ears. It should come low down on the neck, and is as warm wet as dry.

Very often the waterproof dress is of no service whatever. On one occasion, when collecting eggs near Winchester, we were not quick enough with one of the nets, and a whole shoal of trout went up underneath an arch-

I went up into the hatchway and succeeded in catching some eight or nine very large fish. I found the fish with their noses pressed hard against the hatch by the sides of which the water was coming; and every time I caught a fish, was obliged to come out again, and then go in for another. The only fear I had was that some one might open the hatch; I therefore ordered my man to sit on the hatch, with strict orders to allow no one to move it until I had finished my work. I got a fine canful of eggs from these trout.

The reader may ask what I do with the trout when I catch a great number at the same time. I have a net made with three hoops of cane; the net is fastened round these like a bag, and its mouth is drawn up and secured by means of string. This kind of net is generally called a "hoop net," but my man has christened it a "crinoline" net. When the fish are caught in the net, I fasten the "crinoline" on to my waist, keeping its mouth open with a stick; as I take the fish out of the meshes of the net I put them in the crinoline, and, as they are in the water, they will live there for any number of hours, and are always available when wanted. I have often carried fish for half a mile or more in the crinoline, walking up the bank of the river, and dipping the fish very frequently into the water; it is also possible to keep them all night by tying the net to a tree, and keeping it in a deep hole. The old-fashioned way was to carry tubs in which to put the fish; but these tubs were clumsy, heavy things, and the fish apt to die in them, whereas, in the crinoline net, you can always give them fresh water by the simple process of putting the net in the river.

When I am in quest of the larger game, viz., salmon, the work is more severe than with trout. Not many months since, having obtained permission to collect eggs

* I can confidently recommend the waterproof garments made by Cording, near Temple Bar.

in a river in Wales, I was delighted to see some twelve or fourteen salmon on the spawning-bed. Please recollect this was not a brook, but a moderately sized river. With considerable difficulty I managed to get the net across the river, and while so doing, to my horror, a horse came from a field opposite and walked across the ford, disturbing the salmon considerably, and sending one or two into the net. Everything being ready, I and my good friend John Lloyd, Esq., jun., of Brecon, a most energetic conservator of the river Usk, jumped into the ford, and instantly away they went, the whole shoal of salmon, down the river, and crash into the net. They came with such force into the net, and the stream was so strong, that the men holding the net on the other side called out for assistance. They managed, however, by belaying the rope round a tree, to hold on. It was perfectly impossible, we found, to drag the net to the shore. There was nothing, therefore, left but to go into the river and take the fish out one by one. I took out several salmon, which were no good to me, so let them go; and at a most terrific pace they *did* go when once loose. At length I saw a monster of a salmon in the net—a 24-pounder—and was determined to have her; so, getting her into my arms, I allowed her to kick for a while. When a little quiet and faint, I carried her to the shore in my arms like a child. My friend was there already, seated in a chair ready to receive her, with a sheet round him, in order to hold the fish without knocking her scales off. We ultimately returned her to the water, and she swam away as lively as could be. Just as I was letting her go, however, she turned round and hit me as smart a slap in the face with her tail as ever I received from a feminine—lady or fish; but I did not grumble, because I deserved it. The family of this fish, amounting to some 20,000, were all hatched out and turned into the Thames. If they are grateful fish, they will come back again. I carried them that night, starting from the station in Wales at half-past four on a winter's evening, and arriving in London the next morning at a quarter to six. I was thankful that I managed at all, as it was the night of a memorable snowstorm, which carried away all the telegraph wires, and nearly stopped the traffic on the Great Western.

Salmon require a very large "crinoline," and they are a much more delicate fish than trout to keep alive. I therefore sometimes "tether" them if I want to keep them any time. I pass a piece of thick but soft string through one of the gills, and tie it loosely, so as not to interfere with their breathing. Having found a deep hole under a bank, I then slip the fish in, and tie the other end of the string on to a bough. The fish will generally stay quiet all night, and are easily caught again the next morning. On one occasion, being hard pressed, on the Tuam river, near Galway, I put string, in form of reins, on to three salmon, and drove them more than half a mile down the river. They were, however, awkward things to drive, as they would every minute turn round and look me in the face, after the fashion peculiar to leaders of the tandems which we used to drive at Oxford. But I brought ten salmon alive, in a huge box, to Galway, by car and railway. This was about as hard a day's work as ever I went through; but we got nearly a quarter of a million salmon eggs to lay down in the troughs.

When the eggs of the salmon or trout are brought home, I treat them with the greatest possible care and attention. From about the middle of December till towards the end of January, by going to the Royal Horticultural Gardens, South Kensington, the reader will be able to examine the way in which the trout and

salmon eggs are hatched out; and my man, Neville, will be happy to show the various stages of the development of the fish. By the kindness of the French Government authorities at Huningue, I also receive a supply of French eggs. I send them British eggs in return. In this museum will also be seen many drawings and models connected with fish culture, both of the sea and rivers, and also casts of the largest specimens of oceanic fish (including a small whale and a big shark) that have been lately brought to the London market, and for the loan of which I am much indebted to the chief London fishmongers, especially Messrs. Gilson and Quelch, of Bond Street, Grove, of Charing Cross, and Charles, of Arabella Row. These casts and preparations I have made with my own hands, and entirely at my own personal expense.

LIFE ON AMBA MAGDALA, THE STATE PRISON OF ABYSSINIA.

II.

ABYSSINIA has for many centuries been the theatre of bloodshed and spoliation; a country where might was right. Scarcely has a certain individual, pretending to be a lineal descendant of Solomon, the King of Israel, by the Queen of Sheba, through their son Menilech, succeeded in raising himself to the throne of Ethiopia, when factions start up on every side; and the envious, and the *soi-disant* patriot, haranguing the ignorant and credulous populace on the wrongs to which their country is subject, induce them to join the standard of rebellion. The monarch becomes cruel as his power increases; he imposes an enormous tribute and kills his subjects at pleasure. The consequence is that he becomes weaker, and the most insinuating and boldest of his antagonists, by degrees more powerful, until the latter feels himself at last strong enough to offer battle to the sovereign, who of his great army having but a handful of troops remaining, must flee and die in obscurity. The usurper next wages war against those who, rebels like himself, still aspire to the crown, prevails, and places them one after another on the fortress, there to forget their ambitious dreams. These may be said to be dangerous to the State. They have been so under the old *régime*, but may, with certain privileges and immunities, prove the prop of the realm, and the strength of its owner. The high officers and braves of the defeated pretenders enter the service of the recognised monarch, who, fearing their influence and power, conveys them in chains to their former masters, to converse on by-gone happy days, and recriminate in turn.

Next, some of the oldest and most tried followers of the new King are added. They were first his equals, then his tools, and are now the shadows of his former poverty. The King's brain is turned by the dazzling height. As an old toy is spurned by a child, so these must vanish from his sight. Thus the fortresses were filled with inmates; thus Magdala was peopled.

It is a sickening sight to stand at sunrise on the gate of the jail, and see ex-princes, governors, and the great of the land, passing out of the inclosure to their respective houses—those who have been accustomed to govern large provinces in their own right—who have enjoyed every luxury which riches could procure; the gray-headed, the youth, and the boy, all march in one long file, with their heads nearly parallel with the knees. There will never be any change for them until they are laid in the grave. Others—the poor soldier, who

has fallen in disgrace; the thief, the manslayer—all these may flatter themselves with the hope that one day the fetters from their feet and the irons from their hands will be removed, and that once more they will be allowed to depart from the hated mountain. But there is no such expectation for the nobles of the realm. Their high birth has bestowed a curse upon them—it has sealed their doom. If even their present tormentor is supplanted by a new usurper, he will be guided by the same motives. "Why should he endanger part of his conquered dominion? Why should he, by releasing his hostages, sow discord and strife where quiet reigns? The peasants will transfer the love they bore the father to the son; the vassal will hail the arrival of his lord with joy, and all would be confusion and bloodshed. No; they must die in chains!" These are the sentiments which prompt every Ethiopian ruler.

There was a time when the captives were at least humanely treated. Fetters were laid around their ankles, it is true, but never heavier than was necessary to keep them from escaping, and then they were not otherwise persecuted; but at the present time not only have irons, weighing at least ten pounds, been manufactured, but an additional chain on the hand has been put; and whenever the King is in a bad temper, or the least quarrel arises which is reported to him, some new hardship is laid, not only upon those individuals who were the causes, but upon all without exception.

In May, 1865, Theodorus, on his return from his ill-fated expedition to Shoah, was very much harassed by the Galla horsemen, and arrived in great fury at Magdala. Twenty-four Galla nobles, amongst whom was the son of the now ex-Queen Workitt, the heir to the Wollo throne, who all had entered the service of Theodorus of their own free will, and whom he kept here confined as hostages, had to undergo a special measure of suffering on account of the attack of their fellow-countrymen; but the King, still in expectation that an annual tribute would be given to him, laid no violent hands on his victims then. But when, some days subsequently, Menilech, the eldest prince of the late King of Shoah, and son-in-law of Theodorus, deserted his young wife and the royal standard, and fled to the Mussulmen, the fury of his father-in-law knew no bounds. All the Mohammedans were led to the plain; the prince was informed that his mother, having found a new son, could well dispense with him, and they were butchered in the most cruel manner. Every one, the Aboona Salama publicly, and the priests and soldiers in confidence, said that since the time of Menilech such a crime—to kill prisoners, after they had been in chains in Magdala—had not been perpetrated in Habesh (Abyssinia). The fury of his heart unallayed by the blood he had shed, the King vented his rage by inflicting on all the prisoners the misery of hand-chains in addition to those around their ankles.

Besides the political prisoners, no criminals have ever been known, except under the present reign, to be sent to the fortress. They were generally transferred to the magistrates of the districts where they had violated the law, and were sentenced on the deposition of accredited witnesses to pay the damage, or in case of inability were incarcerated for a certain period, or were summarily dealt with, as by flogging; but of late years Magdala has been made the receptacle of all sorts of real and supposed malefactors. There are thieves, those having committed assaults, the manslayers, soldiers under royal displeasure, upwards of thirty females of the better class, the wives of deserted chiefs and their children, some boys of not more than nine years of age, a good number of Shoah soldiers to whom the imputation was made that they

intended to run away, and also very many who have not the remotest idea of their offence, and will probably never learn it. All these, about four hundred, are indiscriminately huddled together in five round houses, twenty-four feet in diameter, in one inclosure, where, after having deducted the space which the buildings occupy, there is not room enough left in any one part for three persons to walk abreast. Of all these *deha* (common herd), no account of their arrival and their crime is preserved. They are placed here and forgotten, or left until Theodorus, getting a fit of generosity, which has not been the case for the last three years, releases some of them. On such occasions he sends for them, inquires the time and cause of their confinement, and acts accordingly; but at other times, while they are being brought into his presence, he becomes annoyed at some exterior object, and, with the pious wish of "May God open you!" orders them to be taken back. There is here a man, for instance, with the name of Negusee, from Lasta, who has been a prisoner for more than five years, and for no other reason but that the soldiers when plundering discovered in the ground near his dwelling a quantity of grain, of which he had not informed them beforehand. In fact, there is no rule whatever observed in the present time. A manslayer, according to the law of the country, could never be shut up in Magdala. A certain number of holy places—a similar institution to the cities of refuge under the Mosaic dispensation—have been reserved for him to flee to, where he must remain until the nearest of kin prefers a complaint against him. Certain authorised judges inquire into the matter, and, finding that the deceased person was not killed intentionally, they leave the relation to choose between a certain sum of money, generally a little above a hundred Maria Theresa dollars, or the death of the criminal. If the former proposal is accepted, and the manslayer is too poor to pay the required sum, he is chained hand to hand to the relative of the deceased, and both, traversing the country, beg until the money is collected; they then give it over, in the presence of the judge and other respectable witnesses, when the prisoner is set at liberty. According to the "Faeta Negest," the Abyssinian code of laws, no compromise can be entered into with a murderer: "as he has shed man's blood, so his blood must be shed by man."

The houses of mud and reeds, which constitute the prison, are locked up during the night; but as soon as the sun rises they are opened, and every one who has been able to build a hut for himself without the inclosure can there spend the day without being molested by any man, except at certain intervals when a suspicion exists that some open their chains in their retreat. All these huts are overlooked by an eminence on the south-west, where the warders sit during the day. Besides this, for every ten prisoners, another soldier is appointed to watch, but cannot enter the abode of any without asking permission. He is responsible for his ten men, and is put in irons himself if one of them escapes, which is, however, a very rare occurrence, and very difficult indeed to accomplish. For the last four years none, except a little boy dressed in girl's clothing, has left the mountain alive; the rest either fell down from the precipice and were dashed to pieces, or were discovered in the venture and subjected to lingering sufferings. Some months ago the brother of a governor of a Tigrian district made an attempt at flight, was recaptured, mercilessly beaten, remained about two months in the stocks, and subsequently was executed.

To keep on good terms with the higher officers must never be neglected by the prisoners; for they can be annoyed in many ways; and, however just their cause

may be, they will never gain anything by complaining. If some one should venture to submit a certain matter to the King, he will too late perceive that every detail has been so altered by the defendant that the wrath of the partial monarch is sure to fall upon his own head.

plaintive sound, the cry of distress, until their small pittance is given to them. But, in order to prevent misunderstanding, I must state that a whole loaf, weighing about eight ounces, has very much the appearance of a pancake, but is not nearly as nourishing as the same

He understands but too well the import of that phrase that "a man wearing chains cannot be considered a human being, and has no right to grumble," and therefore will refrain from finding fault. Patience becomes the best policy, and, rather than resist or complain on being struck, the initiated would prefer to present the second cheek for repetition of the injury.

No rations have for some years past been given to the political prisoners, and if they did not send their servants from time to time to their respective districts to collect some money through relations and their own peasantry, they would be left to starve. The poor, however, receive within the twenty-four hours half a loaf of teff bread and some water, but are frequently compelled to raise a long

quantity of wheat bread. These four ounces of endjerah are scarcely sufficient to keep a man alive, even much less feed him; and they are compelled to increase the amount of their food in the best way they can. Several now and then obtain some employment by their richer brethren in misery, or by soldiers loitering near the prison, and thus earn a meal; others, again, are allowed to go about begging, and it must be confessed that, whatever bad qualities preponderate in the Abyssinian, lack of almsgiving is not one of them: however little he may possess himself, he invariably is ready to give a morsel to the mendicant; and the mendicant in his turn, after having finished his round, in which he generally collects sufficient for his needs, has also a bit to spare for those

who, through sickness and other causes, are hindered from performing their circuit. Nothing beyond this half loaf is ever given by the State; and, if the poor did not receive the worn-out clothes of the well-to-do, they would be in the most wretched condition, and, unless an occasional present is given to them by a relative, they have no means whatever of furnishing themselves with this necessary article. In case of sickness no doctor attends, no medicine is dispensed, no spiritual adviser approaches. They lie on the hard ground day after day, uncared-for, unpitied, and, although racked with pain and distracted by mental anguish, the chains are not removed until death has put an end to their sufferings.

Before quitting this subject I must endeavour to explain the mode and the varieties of chaining. The person to be fettered is made to sit down, and lay one leg on a stone; an iron ring, through which a chain of three links is inserted, is pulled over the foot, and while one holds another beats on it with a stone, very often eliciting cries of anguish from the victim, until it has diminished to the size of the leg immediately above the ankle. The other end of the chain is then introduced into the second ring, and the same operation is repeated with the second leg. Then the right hand is fettered in a similar manner, while the short suspended chain is fastened by means of a small ring to the foot-chain, bending the unfortunate individual to such a stooping position as actually to distort his features in walking. Sometimes to hand and foot fetters a monkoro is added. The monkoro is a piece of wood about six feet long, with something like a triangle at one extremity, like this , which is put around the neck of the prisoner. In such a case the poor man can never leave his place, unless compassionately assisted by some one carrying his heavy appendage before him. The most cruel of all the instruments of restraint are the stocks used for the refractory, and those who make an attempt at escape. A long thick beam with large holes is laid on some stones a foot high: having inserted the feet, irons are hammered around them; and the poor fellow, who cannot sit upright except when supported on his back, must remain lying in the same position for months, without ever being released for any purpose whatever. The runaway, as a rule, when taken out of the stocks is led to execution.

Thus it will be seen that the prisoners occasion to the State very few expenses, and that the prison system of the present time is as cruel and merciless as it possibly can be amongst the most savage nations. I believe that the words of David (Psalm lxxiv. 20), "The dark places of the earth are full of the habitations of cruelty," can nowhere be employed more appropriately.

Since November, 1864, Magdala has been invested with quite a novel character. The Emperor Theodorus, who, in spite of his pompous name, is not more civilised, but perhaps more cunning and certainly more cruel than any of his people, had attained to the summit of Abyssinian glory. He had conquered the most remote provinces, had an immense army at his back, was feared and admired by distant tribes; and, endowed with a good deal of superstition, began to persuade himself, as his subjects had been taught to believe, that by virtue of his adopted name he had become the Theodorus of Abyssinian prophecy, in whose reign felicity and peace should be enjoyed, the conqueror and regenerator of mankind. This pride, which knew no bounds at this period, he deemed had been impugned by high authorities, and he revenged the imagined insult upon those individuals whom he had in his grasp. He chained them in October, 1863, and the following months, tortured and tormented them in various ways, and, after having dragged them

bound two and two together in fetters across mountains and plains, on dangerous roads, a distance of about fifteen days, given over to the tender mercies of the rude soldiery, insulted and harassed at every step, he deposited them in Magdala—I speak of the Europeans. Before this event Theodorus had forcibly detained the Egyptian commissioner three years, had incarcerated "the successor of St. Mark," his visitor, as also his own bishop, and chained the French consul. These arguments were too convincing to the half-savage military. The King had demonstrated to his servants that he is not afraid of the mightiest monarchs of the earth, and had the satisfaction of hearing night after night his courage praised in song, and himself exalted as the vicegerent of the Deity.

Arrived here, we (the Europeans) were treated a degree worse than the lowest criminals. While the latter had a small space assigned to them in one of the houses wherein to seek shelter from the sun by day and the cold at night, we were left in the open air to shift for ourselves as well as we could, not the least consideration being taken of a lady and a young child; and it was only after the lapse of some days that we were allowed to pitch a tent or fasten a piece of cloth under the awning of the roof, wherein we dwelt for the next fifteen months. Seven months we were here in foot-chains, and in the eighth a hand-chain was added. It is true we were not anxious to be driven into one of the houses; for, although to the native no great hardship, it is a trial of no ordinary character to the European, which we had to experience several nights on a subsequent occasion. A cubit (foot and a half) of room was allotted to each of us; but, when our coloured neighbours took their places, we were pushed so much, as to be compelled, since we could not fight, to sit cowering together and watch for the dawn of day; and, when the doors were unbolted at last, we made a rush to change our scanty linen as quickly as possible. During the day we were stared at by the curious like so many wild beasts in the Zoological Gardens; but, while the latter are generally admired on account of their strength, size, beauty, or ferocity, we were criticised on the opposite principle, as having "hair like monkeys, eyes like cats, complexion like milk," etc.; and it was only after several of us began to speak Amharic that we heard the naïve remark, that, "although they do not resemble, yet they are human beings in reality." If we had had the power, as it was imputed to us, of coining dollars to an unlimited extent without any materials, or, in other words, by alchemical processes, we might have had every comfort possible for such a position; but, as we had no friends, and not over-much cash, we had to swallow every abuse until the novelty had died away.

But when we were conveyed hither with the members of the English mission as the king's "friends," in July, 1866, to be chained, our treatment was entirely different from what it was the first time. Although Europeans are so dull as not to understand such kind of amity, yet, on account of the benefits derived from it, we know how to appreciate it. It is one thing to have a house for one's self, or, at least, one for two persons, and to be attended by one's servants, living in the same inclosure, and who can be had when required; and another thing to be obliged to live amongst every sort of filth, and to wait till it pleases the careless Abyssinian to inquire after his master's wants. We therefore make the best of our opportunities; for we do not know what a day, nay, what an hour may bring forth. Several of us write or study languages from the scanty store, or rather wreck, of our books; some fill up

their time with gardening and physical labour; and others find the best occupation in sleeping and paying of visits. The native dignitaries are very polite, more especially to the members of the mission; to them they pay almost a daily visit of some length—for love's sake, it is said; but some individuals, who do not think very highly of the affection of Abyssinians, are inclined to believe that the liberal entertainment and the powers of conversation of Mr. Rassam are the principal means of attraction. As soon as we are informed of their approach, our books, papers, inkstand, in fact, every article creating suspicion, having been removed out of view, we await them at the door of our rooms, with the fervent wish that they might very soon find their way back to the quarter of the great. After a good deal of bowing on our part, and many repeated inquiries after our health on the part of our visitors, with just as many assurances from our lips that all is satisfactory, we are very happy to get rid of them in order to resume our work. I must let out the secret that most of our illustrious guests with high-sounding titles are of very low origin, and that their elevation is not due to merit. They are the creatures of Theodorus. He has annihilated or imprisoned the great, and made small men big.

But whenever there is a report that a royal messenger has arrived, we are not content with laying our writing materials aside: we must find a safer hiding-place. The pockets of coats or waistcoats are hurriedly searched, and every scrap of paper is examined and destroyed. Those, however, which are destined to make a sea voyage are either secreted in the straw of the roof, or thrust in a hollow stick, or secured in a bottle buried in the ground, or are quickly despatched to the dwelling of a native friend, who takes care of them, until we know by the next advent of the chiefs whether the state of things will remain unaltered for a little while longer, or whether "friendship" has ceased to exist, and persecution has commenced. Thus we live on in continual fear and anxiety, sustained, however, by the hope that ere long the hour of deliverance and reunion will strike, when the husband will embrace his wife, the father his children, and when friend with friend will magnify the goodness of God.

I am afraid I have transgressed already on the patience of the reader, but before concluding I must make a few brief remarks in reference to two classes of captives varying from all the rest—the first, the Abunah (bishop), and the Etcheghe (chief prior of the monks). They are without chains, but guarded by soldiers. The former has for some years past been at perpetual enmity with the King; and, although the most influential personage after him in the country, he is not so highly thought of at present as his predecessor; but as soon as a change of government ensues he will again possess unlimited authority, and every aspirant to the throne will be only too glad to obey the behest of Abunah (or Aboona) Salama.

The last which I mention are not generally considered, but are in the fullest sense of the word prisoners—I mean the women confined in the hareem, or elfin as it is called here—the wives and concubines of him who can scarcely any more be called ruler, and the "confiscated" wives of some political prisoners who offered any attraction to the royal connoisseur. Their life is monotonous enough. Shut up in a house, guarded by peevish warders, never allowed to see either mother or sister, they are periodically taken to their master, travelling at night, while another batch is sent back; that is to say, when the roads are not blocked up. At this moment

the women, as well as all other prisoners, are agreed in this particular, that they never any more wish to see the face of that cruel individual who has slaughtered monthly, without exaggeration, his thousands around him, and has converted that part of the country where he is closed in by the rebels into a large charnel-house.

ABYSSINIAN NOTES.

THE map on a previous page has been copied from the route-map prepared by the Government for the use of the officers of the Expedition, with additions from the most recent and best authorities. It will enable our readers to follow more clearly the despatches and letters on Abyssinian affairs. The smaller map shows the position of Abyssinia in relation to surrounding geography. Under the heading of Abyssinian Notes will be published such miscellaneous information as will help to give a fair idea of the country and its people.

BOOKS ABOUT ABYSSINIA.

An article in the "Quarterly Review" for October thus commenced: "Not many months ago Abyssinia was to the generality of Englishmen *terra incognita*. None, save a few geographers, the readers of Bruce's travels, some missionaries and relatives of the unhappy prisoners at Magdala, knew or cared to know much about that part of the world." There was some truth in this statement, but at the same time it is both strange and true that more has been written about Abyssinia than about almost any other country of the same size in the world. In the latest and most convenient handbook on the subject* there is printed in an appendix a list of above two hundred books and tracts on Abyssinia in various European languages! Besides these, there are so many papers and articles in various encyclopedias and dictionaries, in transactions of scientific societies, and in missionary reports, that Sir Henry Rawlinson was justified in saying at a scientific meeting that "it was a mistake to say but little was known about Abyssinia; of few countries do we know so much." At the

* "Abyssinia and its People." Edited by John Camden Hotten. J. C. Hotten, London.

same time there is need now of this knowledge being brought home to general readers in popular form, and this Mr. Hotten's book helps to accomplish. It gives extracts from most of the works of English, French, and German travellers, and, especially, contains the report of the late Mr. Consul Plowden, by far the best account yet printed of Abyssinian life and customs. The Parliamentary Blue-books furnish ample materials for compiled volumes. Of original travels and narratives of personal adventure, the best are "Bruce's Travels" (1790), "Salt's Voyage" (1814), Mansfield Parkyns' "Residence and Travels" (1853), Cornwallis Harris's "The Highlands of Ethiopia" (1844), "Dufton's Narrative" (1867). Of foreign books, the best are those of Rüppell, Gobat, Ferret et Salinier, and others mentioned in Mr. Hotten's volume.

GEOGRAPHICAL AND POLITICAL BOUNDARIES.

From the "Quarterly Review" article, already mentioned, we quote a brief geographical statement:—

"The geographical limits of the 'Abyssinia' of the present day are no longer those of the ancient kingdom of Ethiopia, which was bounded on the east and south-east by the Red Sea and the Gulf of Aden. The whole of that seaboard is now claimed by Turkey; while the low desert country lying between the seaboard and the high-land of Abyssinia is occupied by lawless and independent tribes. 'Abyssinia proper' is now limited to the high-land between the 9th and 16th degrees of north latitude, and the 36th and 40th degrees of east longitude.

"The theatre of our military operations will, however, include a portion of the eastern desert and of the seaboard, and may be defined as bounded on the north and north-west by Nubia, on the east and south-east by the Red Sea and the Gulf of Aden, and on the south and west by Southern and Central Africa. In common parlance, also, this tract of country may be considered (though not quite correctly) as 'Abyssinia.' The length of this district, from Massowah in the north, to the upper part of the river Hawash in the south, is, as measured in a direct line on the map, about 500 miles. Its breadth, from Metemma in the west to the Red Sea, as measured on the map, is also about 500 miles.

"'Abyssinia proper' is divided into six chief provinces: Tigré in the north, Samen and Lasta in the centre, Amhara, Godjam and Shoah in the south. It is intersected by numerous rivers and streams, the latter being, for the most part, mountain torrents. The principal rivers are the Mareb* and the Tacazze (one of the chief tributaries of the Nile), in Tigré; the Abai (a tributary of the Blue Nile), in Godjam; and the Hawash, in Shoah. This latter river flows towards the Gulf of Aden, but loses itself in a lake in that neighbourhood, and does not reach the sea. All these rivers run in deep valleys. In the rainy season they are full and swollen, in the dry season they are fordable at all points, and often contain little or no water.

"Abyssinia may be described as a vast high and mountainous table-land, about 500 miles long, with a mean breadth of perhaps 200 miles, rising up from the plains of East Africa. It is bounded on the east by a desert which reaches to the shores of the Red Sea, and on the north, north-west, and west, by the plains of Nubia and of Central Africa. The eastern desert, which separates Abyssinia from the sea, varies very considerably in width. While at Massowah (the principal port on that coast, close to the north-east corner of Abyssinia), it is only a few miles broad, at Amphilla (a seaport 100 miles further south) it is 100 miles broad, at Tajoura (in the Gulf of Aden) 200 miles, and farther south even 300 miles wide.

"The eastern edge of the great plateau or high-land of Abyssinia rises abruptly from this desert to a height of between 8000 and 9000 feet above the sea level, and runs due south in a direct line from near Massowah in the north, to the vicinity of the upper Hawash in the south, a distance of 500 miles. To penetrate Central Abyssinia from any point between Massowah and the Gulf of Aden, therefore, this mountain barrier must be ascended.

"The plateau of Abyssinia would thus appear to have a general fall or slope from the east to the west, which is, moreover, evident from the fact that all the rivers (with the single exception of the Hawash, which is, moreover, beyond and outside of the high-land) flow towards the west. But though it may, perhaps not incorrectly, be described as a table-land, Abyssinia presents to the traveller all the features and difficul-

ties of a highly mountainous country; for it is intersected by ranges of mountains, some of which rise to the height of 14,000 or even 15,000 feet, and on whose tops both snow and ice are to be found. It is further cut up by rivers whose beds run in extraordinarily deep valleys, so deep as to be 3,000 feet below the general level of the plateau."

KING THEODORE.

King Theodore, the hero of the hour, has had a history of romantic vicissitude. Though his father claimed to be descended from the line of the ancient kings, he was left when yet a child an orphan in abject poverty, his mother following the humble calling of a kouso* seller. He was sent to a convent to be brought up as a priest; but the convent being attacked by a robber chief, who put most of the inmates to the sword, Dejaz Kassai (such was his name in early life) escaped to the castle of a powerful uncle, Dejaz Confu. On the death of Confu his sons quarrelled, and Kassai sided with the eldest, who was defeated. He then became a robber chief. Gaining many followers, he trained an army, and raised the standard of rebellion under the pretext of checking oppression and resisting violence. The Queen of the usurping Galla race, long hated by the oppressed people, sent an army against him. Her troops were defeated. Finding force unavailing, the Queen offered to the successful warrior her grandchild in marriage, intending thereby to betray him into her power. The princess, however, became a faithful and devoted wife, warning him of all the plots contrived for his destruction. At length the treacherous Queen and her son, Kassai's father-in-law, were defeated in a pitched battle, and fled from the country. Kassai had still several chiefs to conquer and provinces to subdue. Tigré was ruled by an ancient warrior, Dejaz Oulie. A great battle was fought on the 3rd February, 1856, which resulted in the total defeat of the Ras or King of Tigré. The conqueror was crowned on the 5th of that month by the name of King Theodore. The ceremony was performed by the Aboona (papa or father) Salama, Metropolitan of Abyssinia. Gradually all resistance to his claim was overcome, and he became undisputed ruler of the country. In his battles he was assisted by several foreigners, and his chief counsellor was Mr. Bell, an Englishman, who was killed in one of the battles while saving the life of his friend and sovereign.

When Mr. Stern, author of a deeply interesting book, "Wanderings among the Falashes† of Abyssinia," arrived in the country, he was hospitably entertained by Mr. Bell, and by him introduced to the King. He was pacing up and down in his camp, surrounded by many of the nobles and chief warriors. "With uncovered heads we approach. In the most urbane manner he beckons us to advance, and, among other questions, inquires how a Christian nation like the English can tolerate idolatry in India, and uphold the power of Mohammedanism in Egypt and Turkey. Mr. Stern replies that Christianity teaches us to love and not to persecute; to instruct and not to oppress an unbeliever. 'Avoonah! avoonah!' (True! true!) exclaims the King. 'And if this is your design in Abyssinia you have my approval to your mission, if you likewise obtain the assent of the Aboona.' He adds, 'You are my brother and my friend, and you have my full sanction to visit every province in my kingdom.'"

Bishop Gobat, who visited Abyssinia in 1880, in describing the Falashes, says that they retain some lingering notions of the predicted Messiah; and when he questioned them regarding his coming, they replied that he would probably appear in the character of a conqueror, by the name of Theodoros, whose advent they supposed was near; an expectation, he adds, which the Christians of Abyssinia shared equally with themselves.‡ This remarkable statement was published long before Dejaz Kassai was heard of; and it is probable that the crafty warrior took advantage of the prevailing rumour in assuming the name of Theodore on his coronation.

With regard to the personal character of Theodore, there have been very conflicting accounts. The truth seems to be that to his undoubted natural ability he added some good qualities

* Kouso is a plant regarded as a specific against tapeworm, a disease frightfully common in Abyssinia.

† The Falashes are a numerous race in Abyssinia, of Jewish origin. They are supposed to have settled there after the destruction of Jerusalem, though some of them claim to be descended from far more ancient Hebrew emigrants, of whom the Queen of Sheba was ruler. The Falashes derive their name from the Ethiopic word *Falash*, which means an exile—a remarkable confirmation of their alleged origin.

‡ "Journal of a Three Years' Residence in Abyssinia." By the Rev. Samuel Gobat, now Bishop of Jerusalem. P. 467. Dodd, New York.

* Sir Samuel Baker, in his new and interesting book, "The Nile Tributaries of Abyssinia," tells us the curious fact that this river loses itself in the sand in the vicinity of Kassala, and never reappears—thus correcting the popular idea that it joined the Atbara or the Nile.

of heart, which for a time were called into exercise, especially under the guidance of such counsellors as Mr. Bell and Mr. Plowden. The latter has thus described him:—"Dejaj Kassai is vigorous and subtle, daring to a fault, and, perhaps, more disposed to innovation than any. He has abolished in his army the practice of mutilating dead bodies; taught his soldiers some discipline, makes war without baggage or camp followers, and encourages foreigners. Though proud, his manner is all humility; he is severe, liberal, and usually just, but breaks out now and then into unaccountable acts of violence, which indicate a somewhat unsettled temperament; he commences enterprises with more vigour than he pursues them, and is much under the influence of prophets and fortune-tellers."

Sir H. Rawlinson has remarked on this report that King Theodore had abolished Mohammedanism, had secularised the church property, and had crushed the priestly influence, which, in the time of Mr. Plowden, was one of the crying evils of Abyssinia. He had also introduced many useful reforms into the administration of justice, and had adopted measures for the encouragement of industry. As long as Plowden and Bell were alive he was to a certain extent a model sovereign, but since their deaths he had gone altogether wrong.

Dr. Beke, however, affirms that Theodore was from the first an arrant villain. He was made a great man and a good man by Bell and Plowden, but the moment they died he became bad. As long ago as 1852, Dr. Beke says, he was an arrant drunkard, and used to fire under the table at the legs of his guests.

Fits of drunkenness, added to an ungoverned temper, suffice to account for the wild and capricious conduct of Theodore to his British captives, as well as the horrid cruelties to his own people, except they are to be ascribed to partial insanity.

The story of the relations of King Theodore with the British Government would be too long to tell here, but the following may be received as a sufficient account of the maltreatment of the British subjects which has led to the war of release and redress. When Consul Cameron came the first time to Abyssinia he was well received by his Majesty and presented with valuable presents. The King wished him to take a letter to England, and to bring an answer. He was either to go himself all the way, or, at least, to Massowah, and there wait for the answer. Mr. Cameron went a different route to Massowah from that advised by the King, as he wished to get some medicine from Mr. Flad, one of the missionaries. He also dismissed Aito Samuel, a Jew convert, who had been sent as his escort and interpreter. This Samuel wrote a letter of accusation to the King against Mr. Cameron, and other Abyssinians told the King that Mr. Cameron had been heard speaking disrespectfully of him. A Frenchman, M. Bardel, now high in favour with the King, is said to be mischievously active in poisoning his mind against the English, and against the missionaries. When the King afterwards saw Mr. Cameron at Gondar he was enraged at his going among his enemies, and also at not bringing back a letter from the Queen. "Why does the Queen not write to me?" he said. "Who is Russell?" (the letter last received having been signed by Earl Russell). "Let the Queen write herself." On the arrival of another Foreign Office despatch the King's rage knew no bounds. The Consul was made a prisoner in the camp. Once, on asking leave to go to his own house on account of his state of health, the King refused, saying, "Let him die, if they only cannot say that I have killed him. Where is his answer to my letter? Why does his Queen despise me?" On asking leave to return to his post as Consul at Massowah he was put into chains along with the missionaries and others under his protection. "When we were in prison," writes Mr. Flad (Blue Book of 10th August, 1867), "the King once sent us a message, saying, 'The Consul I have imprisoned because his Queen did not send me an answer. Personally, I have nothing against him. Messrs. Stern and Rosenthal I have imprisoned because they have abused me, and the rest (we were ten Europeans) I have imprisoned because I found that you white people are all bad.'" When Mr. Rassam arrived with a special letter from the Queen he was received with outward courtesy, and the King wrote an extraordinary letter, in which he says, "I have released Mr. Cameron and the other prisoners, and all Europeans who might wish to leave the country, and I have kept Mr. Rassam, for the sake of consulting together upon the extension of our friendship." Afterwards, like another Pharaoh, the King was angry because the prisoners were free, and caused them to be seized, on pretence that they insulted him by not going to say farewell before leaving. Mr. Rassam and the rest have since been in durance, some at Magdala, and others at Debra Tabor, and the King's camp. The whole number of European prisoners, including women and children, is about sixty.

Varieties.

INTERNATIONAL LAW.—By the will of the late Dr. William Whewell, Master of Trinity College, funds are bequeathed for the endowment of a chair of International Law at Cambridge. The Professor in his lectures is "to make it his aim to lay down such rules and suggest such measures as may tend to diminish the evils of war, and finally to extinguish war between nations." Scholarships in international law are also to be founded. The hopes of extinguishing war by public or international law, it is to be feared, are Utopian, as long as the passions of human nature have sway. Nevertheless, it is well to have sound information and right feeling diffused on certain points upon which nations of equal civilisation may consent to arrange articles of agreement.

DR. ALDERSON OF NORWICH, FATHER OF AMELIA OPIE.—He was much afflicted with a painful disease, which he bore with patience, and allowed me to take away the following prayer, which he had just been writing, and which I found lying on his table:—"Almighty God and most merciful Father! I humbly beseech thee to ease my pain, increase my patience, and lay upon me no more than I am able to bear, although I have deserved it all: and grant that when my soul is released from this prison of my body, it may be admitted into that rest which is appointed for all such as repent, amend, and believe; as I trust does thy unworthy servant, who now lies prostrate before thee, in humble reliance on the atoning merits of thy beloved Son, who suffered death that we might enjoy life eternal, and to whom be all honour, dominion, and power for ever and ever. Amen!" He continued steadfast in the Christian faith until his death, which took place about two years afterwards (1823).—*J. J. Gurney's Autobiography.*

A USEFUL HINT TO MOTHERS AND GUARDIANS.—It is within my certain knowledge that, particularly with Italian singing-masters, advantages have been taken when opportunity offered. In fact, no teacher—whether he be music-master, dancing-master, riding-master, or a master of any sort—ought to be permitted to give lessons to a girl unless in the presence of an efficient chaperone. Look at the many instances of riding-masters riding off with their pupils at Cheltenham and other places, and the affairs we have heard of, and those which have been hushed up, that spring out of other educational lessons; they make one wonder that there are yet many mammas who remain with their eyes unopened.—*Hon. Granville Berkeley.*

SIR ROBERT NAPIER, K.C.B.—The commander of the Abyssinian expedition, an officer of the Royal Engineers, has a distinguished name, both as a soldier and politician. He served through the Sutlej campaign of 1845–46, and at Moodkee, at Ferozeshah, Sobraon, and the subsequent advance on Lahore. In 1846, he was chief engineer at the siege of the hill fort of Kangra, and in 1849 at Mooltan. He was commanding engineer with the right wing of the army of the Punjab at the battle of Goojerat, and in Sir Walter Gilbert's pursuit of the Sikh army. He commanded mountain columns against hill tribes of Afreedees in 1852. In 1857 he was chief of Sir James Outram's staff, and was present in the action leading to the first relief of Lucknow, and the capture of Alumbagh. In 1858 he was chief engineer at the siege of Lucknow, and took active part in the subsequent dispersion of rebel forces. In 1860 he commanded a division of the China expeditionary force, directing the operations at the storming of the Taku forts, and the occupation of Peking. In person Sir Robert Napier is described as above the middle height, with a slight stoop, which makes him at first look shorter than he really is. His hair, whiskers, and moustache are becoming white, but this is almost the only sign of age that can be detected in the man who served with distinction in the Sutlej campaign. In energy, activity, powers of endurance, and general aptitude for all kinds of work, at the desk or in the field, the youngest and most active of his staff—and his staff includes many officers who are both young and active—are put upon their mettle, and require all they can do to keep pace with him. In manner he is extremely quiet, even subdued, and, although studiously courteous, a little reserved and distant with strangers. He is a splendid horseman, and is said to excel greatly as a writer of clear and effective despatches. He was military member of the Supreme Council in Calcutta; but in 1865, when Sir William Mansfield was appointed to the chief command, Sir Robert was offered and accepted the command of the Bombay army, and has continued in that appointment till entrusted with the command of the Abyssinian expedition.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

OLD MATTHEW, THE SEXTON.

THE MORTONS OF MORTON HALL.

BY THE AUTHOR OF "THE GREAT VAN BROEK PROPERTY."

CHAPTER IX.—THE OLD SEXTON'S RECOLLECTIONS AND REVELATIONS.

It was but a short walk from the inn to old Matthew Budge's cottage—an old, brown-thatched dwelling, of one storey in height, with walls of rough stone, white-washed, and gravitating inwards, as much probably through carelessness on the part of the builder as from the effects of age, and with narrow, latticed windows, with lozenge-stamped panes of greenish glass, set in leaden framework. The cottage stood on the very verge

of the common, in a small plot of garden-ground, in the arrangement of which the *utile* had been judiciously combined with the *dulce*—the cabbage and onion beds being bordered with flowers and sweet-scented shrubs, and green and sweet peas lovingly and gracefully intertwining their tendrils around the palings. In the summer season the little plot of ground might have presented an agreeable aspect, though now it looked dismal and dreary enough, a few crocuses and snowdrops alone raising their heads above the soil, which was still covered with the winter snow.

The garden gate stood partly open, and Mr. Aston,

who had set out at an early hour from the inn to visit the aged sexton, entered the gate, and, traversing the pebbled pathway which led to the door of the cottage, raised the latch, unseen and unheard by the inmates. He found himself in the presence of an old man, who was seated in a large, wooden, but comfortably cushioned arm-chair, in front of a blazing wood fire, built on the hearthstone, beneath one of those huge, open chimneys which are still to be met with occasionally in old-fashioned country cottages and farmhouses.

He was a small, feeble-looking old man, with a thin, wizened face, seamed with a number of minute, almost imperceptible, wrinkles. His scanty locks were white as drifted snow, and his eyes, dim with years, were deep set beneath a pair of shaggy, white eyebrows, which, together with his hair, contrasted vividly with his complexion, tanned to a deep red hue by life-long exposure to sun and weather. His gums were almost toothless, and, his mouth having fallen in, his somewhat prominent nose and chin almost met together, imparting a wizard-like aspect to his countenance. He had been a lithe, wiry-framed man in his day, and such men frequently wear well; but he now looked as if a gust of wind might easily whisk him away up the wide, open chimney; and as Mr. Aston stood gazing upon him, he marvelled that a man of such slight, attenuated frame had been spared to attain to a patriarchal age, while so many men of more robust mould, whom he had formerly known, had been stricken by the hand of death in their prime.

The old man was neatly attired in rustic garb, and on a round oak table near his arm-chair lay an open, large-print family Bible, and a pair of horn-rimmed spectacles; but he now sat gazing dreamily upon the charred embers on the hearth, with one hand resting upon the arm of his chair, and the other, in which he held a long clay pipe, reposing listlessly on his knee; while a large tortoiseshell cat, sleek, and indolent with good feeding, was stretched at full length at his aged master's feet, purring loudly, and blinking his eyes at the fire—the picture of ease and content.

The clean and neatly-sanded red brick floor, the well-kept, though humble and old-fashioned furniture, the crockery exposed to view in the open cupboard, and the old-fashioned, loud-ticking clock, in its long case, in one corner, imparted an air of snugness and comfort to the little room; while the side of bacon, the partially-cut ham, and the strings of onions and dried herbs depending from the rafters, proved that the old sexton's family were well-to-do folk for their lowly condition.

The sound of the visitor's footsteps brought from an adjoining room a little girl of twelve years of age—the old man's great-granddaughter, and his sole attendant during the day, when the other members of the family were engaged in their several out-door duties—who stood staring, with her finger on her lips, with childlike wonder at the unknown visitor; and Mr. Aston might have remained a long while unnoticed by the old sexton, had not the little girl, after she had got over her first surprise, stepped quickly to his side, and whispered close to his ear—

"Gran'ther, here be somebody come to see thee;" upon which he turned his head, and stared at his visitor with an expression of dull inquiry.

"I am an old acquaintance, Matthew Budge," said Mr. Aston. "I have been many years absent from Fordham; but, as I knew you when I was a child, I have called to visit you."

The centenarian peered from beneath his shaggy eyebrows into his visitor's face, but apparently with vain scrutiny, for he shook his head, and, sinking back in his

chair, partially closed his eyes, as though he had become unconscious of the stranger's presence.

"You do not recollect me, Matthew?" continued Mr. Aston, as he seated himself on the settle near the fire, beginning to fear, in spite of the assertions of the landlord of the "Wheatsheaf," that the old man's faculties were too feeble to render the visit of any avail.

The strange voice, however, again aroused the patriarch of the village from his torpor.

"Nay," he muttered; "oi canna say oi do. An' yet there's a summat i' thy feace oi seem to mind. What-ten naime didst say?"

"Aston. But you will not recognise me by the name."

"Aston! Aston!" muttered the old man. "Na, oi dunno ony sich name i' they pairts."

"No; you would not know the name: but I was often in the village when a boy, and I know *you* well."

"Beloike, measter. There be many as knaw'd me when they wor childer as be owd foulk wi' gray hairs now. Oi'm owd—very owd—a hunder an' one come Michaelmas."

"You must have seen many changes in your time. I've been told that your memory carries you back to the days when the parents of most of the old people in the village were young."

"Measter," replied the old man, gradually rousing himself as his thoughts reverted to the days long gone by, "oi moind afore ony now livin' i' Fordham wor born. Oi moind the feythers an' mothers o' most as be now livin'. Oi digged th' graves o' many on 'em; an' oi stood to the 'kirsenin' o' t' owdest man an' ooman i' th' village. Ay, i'm owd—very owd."

"Then, of course, you remember the old family at Morton Hall?" said Mr. Aston, coming at once to the object of his visit.

"T' owd squire's family!" replied the old man, brightening up at once at the mention of Morton Hall. "Ay, measter; oi mind toime when t' squire, as be dead an' gone thretty year, wor born. Ay, there wor gran' doings at the Ha', thatten toime!"

"It is of the old family of the Mortons that I wish to speak," continued Mr. Aston. "I was intimate with the family when I was a boy, and I wish to learn all I can about them, and the manner of their deaths. I have been very long absent from England, and I return to find a new family at the Hall, and to find most of the people of the village, whom I formerly knew, removed or dead. I have been told that you alone can give me the information I require, and I have come to ask you to tell me all you know of your old patrons, the Mortons."

"A' dead an' gone; a' dead an' gone!" repeated the old man, shaking his head, sorrowfully. "Ay, ay, 'twor an ill day for Fordham when the last o' the Mortons wor laid i' the grave."

"But surely *all* are not dead?" said Mr. Aston, anxiously. "The sons, as I have learnt from the tombstone in the churchyard, were suddenly carried off; but I see no mention of the death of my—of Mary—of the squire's only daughter. Mary Morton was many years younger than either of her brothers. If she be still alive she is not yet an old woman."

The old sexton shook his head dolefully, but made no reply.

"There is something amiss," continued Mr. Aston; "tell me what it is. Tell me all you know of the family. I cannot make you understand how anxious I am to hear their history."

The old man, whose faculties now seemed perfectly

clear, sat silent for some moments, with his eyes closed and his wrinkled brow knit, as if striving to collect his thoughts, and then, with a prolixity and minuteness of detail peculiar to the aged, especially of the humbler classes, he related all he knew of the history of the Mortons, from the birth of the old squire to the death of his eldest son. Mr. Aston listened to many of these details with manifest impatience, as if they were familiar to him; but he made no attempt to interrupt the narrator, being well aware that the trifling matters upon which the old man dwelt with child-like interest were the connecting links by means of which he retained the story in his memory, and that to interrupt him would be but to perplex him, perhaps beyond recall.

The prolix details, narrated in a strong provincial dialect, and interspersed with numerous episodes which had little or nothing to do with the history, would be as wearisome to the reader as they were to the listener: the old sexton's story was to the following effect, omitting the earlier portion of the narrative, and commencing at the date of the death of the second son, Charles, who fell at the siege of Gibraltar.

At this date Madam Morton, as she was commonly called by the village folk, had been dead six years, and the squire's only daughter and youngest child, Mary, was in the tenth year of her age.

The family estates were strictly entailed upon heirs male, and, as old Mr. Morton had now but one son living, he was particularly desirous that this son should marry, as, in case of his decease without leaving male issue—and the young man was of a very feeble constitution—the estates would fall into the possession of a distant cousin, the head of a junior branch of the family with which the elder branch had long been at feud. The young squire had no objection to obey his father's wishes. He had been long engaged to the daughter of a neighbouring county magnate, and it was arranged that his marriage with the young lady should take place as soon as a decent period of mourning for the younger brother had elapsed.

Time passed away, the wedding day was fixed, and all arrangements had been made, when the old squire, who was passionately addicted to field sports, was thrown from his horse while following the hounds at a county hunt, and killed on the spot. The young heir came into immediate possession, but the marriage was necessarily deferred for six months, and before this period had expired Edward Morton was taken seriously ill, and eventually died of consumption within twelve months from the date of his father's death.

The daughter, Mary, was now the only surviving member of the family. The estates passed into possession of William Foley, the distant cousin and the present possessor.

The rent-roll of the Morton Hall estates amounted to about ten thousand pounds per annum; but the old squire had been addicted to hospitality and to lavish expenditure, and had lived fully up to his income. His daughter Mary was, by her mother's will, entitled, on the day of her marriage with the consent of her father or guardians, or on attaining her majority, to a fortune of ten thousand pounds (her mother's marriage portion), and therefore the old gentleman considered her sufficiently well provided for.

On her father's decease, Mary's elder brother became her natural guardian; and, when the young squire found his own end approaching, he appointed his cousin Foley, to whom he had become reconciled, and the family solicitor, his sister's joint guardians.

The clause in the will which deprived Mary of her

fortune if she married, before she attained her majority, without the consent of her guardians, had not been inserted with a view to coerce or control the young lady in her choice of a husband, nor with the intention that her fortune should be withheld under any circumstances, but merely that it might operate as a check against the machinations of fortune-hunters, who might otherwise trifle with the affections of a young and motherless girl, and seek to wed her solely for the sake of her fortune. But it was liable to an abuse which neither the original legator nor the young lady's brother had anticipated. After her brother's decease, Mary continued to reside at the Hall with her father's cousin, and Squire Foley resolved, if possible, to secure her fortune to one of his own sons.

Mary, who had never evinced any particular affection for either of her cousins, finding herself urged to select one of them as her future husband, conceived an unconquerable aversion to all of them. She appealed to her late brother's solicitor—as her joint guardian—for protection, only to learn that he had become a mere creature of Squire Foley's, and she then avowed her intention to remain single until she became of age and her own mistress.

The fact was that her affections were already engaged to a young naval officer who frequently visited the house of a neighbouring squire. The young people had first met when they were mere children, and when the young sailor was serving as a midshipman; and the affection which they had then formed had grown stronger until they had become secretly betrothed to each other.

On making this discovery Squire Foley commenced a system of persecution, with the object to compel his ward to relinquish her purpose and accept the hand of one of her cousins, or to drive her to marry the object of her choice before she became of age, when she would place her fortune in his grasp. Unhappily he succeeded in the latter object. Mary was watched wherever she went, and forbidden to visit her friends, until her life at the Hall became unendurable. At this juncture the young sailor, now a lieutenant, returned from a cruise, and as usual visited his friends, and heard how Miss Morton was treated. In spite of all the endeavours to prevent them from meeting, the young people found means to see each other. The lieutenant was indignant at the way in which the young lady was treated, and, though Mary was at this period only eighteen years of age, he urged their immediate marriage.

"They dare not withhold your fortune for their own credit and honour's sake," he said; "and if they should be so mean, I shall be a captain by-and-by, and my income will be sufficient to support us in comfort. I don't care for your money; but this cruel persecution, if continued any longer, will injure your health, and render your future life miserable."

Driven to extremity, Mary listened to the young sailor's arguments; and, with the connivance of Mrs. Margaret, the housekeeper, who had nursed her when she was an infant, and who was the only domestic who, for her sake, had remained in the service of the Foleys when the Hall changed masters, she contrived to escape from the Hall, and taking her seat in the stage journeyed to London, where she was met by the young lieutenant and his sister, who took her to their mother's house. The young couple were quietly married at the church which the family of the young sailor were accustomed to attend.

It is doubtful whether Mr. Foley was most annoyed or gratified at the result of his persecutions. Probably he would rather that his ward had acceded to his own

views, and wedded one of his sons; but, at all events, he had gained his end—viz., the control of the young lady's fortune. The housekeeper, who had betrayed her trust, was immediately dismissed, and Mary was informed that, since she had disobeyed the expressed wish of her deceased relatives, she must submit to the consequences, inasmuch as her guardians felt themselves in duty bound to withhold the dowry which would have been hers, had she married in accordance with their wishes. Mr. Foley added, moreover, that by her own act she had for ever alienated herself from her family.

The young couple cared little at the moment for this fulmination, nor for the ban of excommunication by which it was accompanied. They still believed that Squire Foley would cool down in course of time, and that he would not dare to withhold his ward's fortune; and, when at length the young wife attained her majority, her husband and herself made a formal demand for the payment of the ten thousand pounds to which Mary was entitled by her mother's will.

To this demand the reply came that Mr. Foley knew of no such sum of money to which the late Mary Morton was *now* entitled, and that any other letters from her would be returned unopened.

What subsequently became of Miss Morton the old sexton was unable to say. More than twenty years had elapsed since the period of her marriage, and during that period neither she nor her husband had visited Fordham. The housekeeper, Mrs. Margaret, had visited the village about six years afterwards, and from her the old sexton had heard many of the circumstances he related; and he had also heard that "Miss Morton as was" had given birth to a daughter. But Mrs. Margaret had never repeated her visit, and he did not know whether she, or the young lady, or her husband, or child, were living or dead.

"To this day," the old man added, "the Foleys are thought ill of by the neighbouring gentry, in consequence of their base conduct towards the orphan daughter of old Squire Morton."

Though Mr. Aston had listened patiently to the old sexton's narrative, he had more than once betrayed, by his deep breathing, and bent brow, and clenched teeth, the indignation he felt against the Foleys; and now, when the old man ended his story, he said—

"I have yet a few questions to ask you. In the first place, can you tell me the name of the young officer who married Miss Morton?"

"Oi've been thinkin', sir," replied the old man; "but oi canna just moind. Oi'll tell thee in a minit, though. Polly, my lass"—to his great-grandchild—"go thou oop steers, and bring down t' Bible i' moy bedroom."

"T' Bible, measter," he went on, "wor sent to me arter her marr'ge, by th' young ledly, wi' her best wishes, and oi ha' kep' it careful ever sin'. Th' name's writ inside, i' the young ledly's own handwrite."

The child presently returned with a small Bible, bound in purple morocco, and as good as new; and, on looking at the fly-leaf, Mr. Aston read, with evident emotion, the words—

"To my good old friend, Matthew Budge, with the best wishes of Mary Talbot, late Mary Morton."

"Ay for sure! Talbot be th' name, sur," said the old man. "Oi ha' tuk care o' th' Bible ever sin', for she wor a good friend to me, wor Miss Mary."

"Talbot!" muttered Mr. Aston, and he wrote down the name on his tablets. "You are sure that the gentleman was an officer of the navy?" he inquired.

"Mortal sure, sur. He wor a sailor, and they called him Leeftenant Talbot."

"Again, my old friend, have you any idea where the old housekeeper, Mrs. Margaret, can be found?"

"No, measter; but her marr'd Muster Jenkins, t' butler, and I ha' heard say as he sot oop a gran' shop i' Lunnun, an sowl coals an' taaters, and greens, an' sich-loike, an' made a fortun'."

"Hem! I have yet another matter to speak of," continued Mr. Aston. "I think you have left one affair of importance out of your narrative. If I recollect right, old Mr. Morton had *three* sons, one of whom was much younger than his brothers, Edward and Charles. His name was Henry, and he was but a few years older than his sister Mary."

"Oi ha'nna spoken o' Measter Henry, sur, tho' oi moind t' lad right well. But he had nought to do wi' Miss Mary's story. T' poor lad wor lost at sea when he wor no more'n fourteen year owd."

"Was conclusive intelligence of Henry Morton's death received by his father?"

"Well, sur, as oi ha' towld ye, he wor a sailor, i' the navy, they ca't, an' 'twor said as his ship wor fought an' sunk i' the Channel, by a French ship as wor a mortal deal bigger nor hisn, afore the poor lad had been more'n a week at sea. On'y one or two o' the sailors wor saved, and Measter Henry worn't one o' they. Oi moind when t' news came to the Ha', as 'twor on'y yesterday. T' owd squire and Miss Mary wor i' great trouble; and squire, he made every sarch he could, though 'tworn't easy i' they toimes, when there wor war wi' France. But nought wor ever heard on him, so they went into mournin', and gi'n him oop for dead."

"But suppose that Henry Morton were not dead? Suppose that he were picked up out of the sea by the French sailors, and taken to France, and put in prison? It would have been almost impossible for his friends to discover that such was the case. They could not have written to *him*, nor could he have written to *them*. Suppose that after lying a long time in prison he made his escape, and, speaking French well, he passed himself off as a shipwrecked sailor-boy, and thus, begging his way through France from Montauban to Bayonne, got on board a French vessel bound to Lisbon in Portugal. Suppose that on his arrival at Lisbon he ran away from the French vessel and shipped on board a Portuguese trader bound to the East Indies—sailing all this time as a poor cabin-boy, and finding no opportunity to communicate with his friends, until at length, after sailing to and fro from port to port in India and elsewhere, he grew careless alike of himself and all belonging to him, still intending, however, to return home some day."

Mr. Aston had begun by addressing the old sexton, but went on as if recalling to himself the chief events of his past life. The old man leaned forward, listening with amazement, as the story unfolded itself.

"Imagine all this, and then suppose that Henry Morton, who was believed to have perished at sea, landed at last in America, as poor as on the day on which he escaped from the French prison; but that after he had been thus the sport of Fortune for so many long years brighter prospects began to smile upon him. Suppose that he purchased vast wild lands in the wilderness of the far West, and that, after a while, settlements sprung up around him, and these lands became valuable, and continued to increase in value until the young lad, believed by his friends to have perished at sea, found himself fast becoming a rich man. Suppose that he married and became the father of a family, constantly engrossed in the care of his property, and the safe investment of his ever-increasing wealth, yet still *sometimes* thinking of old friends at home, and still intending

some day to visit them; but ashamed now to write and let them know how neglectful he had been, and resolved to wait until he, the youngest son, could return home as rich as the heir to his father's estates.

"Suppose that at length his wife and most of his children died, and were laid in their graves in the dim solitude of the forests of the far West, and that the bereft husband and father thus found himself bound still more firmly to the land of his adoption, beneath whose soil the bones of his loved ones lay buried; yet still withal finding himself, as he began to grow into years, filled with an intense longing to behold once again the land of his birth and the friends of his youth, in remembrance of whom he possessed but one relic, which he had preserved amidst shipwreck and imprisonment, and which he had treasured amidst all his wanderings, though oftentimes tempted to sell the gold in which it was set to purchase the food he stood in need of.

"And suppose, at length, that the lost sailor-lad, Henry Morton, made up his mind to leave his remaining children for awhile, and return himself to his native land, bringing with him this one relic, so long preserved, and one brief record that would tend to establish his identity, if time should have so changed him that his friends failed to recognise him.

"He arrives in England; he comes back to his native village; he revisits the home of his fathers—alas, to find strangers in possession thereof; he inquires for his relatives, and is told that they are no more; he asks after his friends, and learns that they are dead or scattered none knows whither; he walks abroad to find himself a stranger among strangers, amid the scenes endeared to his memory from boyhood.

"These scenes he finds but little changed since he gazed upon them long, long years ago; but of all whom he knew as a child there remains but one old, old man—old Matthew Budge. Matthew, I am that Henry Morton."

The old sexton, fatigued by the unwonted exertion of talking so long at a time, had paid but little attention at first to Mr. Aston's speech. As he proceeded, however, the old man brightened up again, and gazed earnestly, yet doubtingly, into his face. Then he took up his spectacles and fixed them on his nose, and gazed more earnestly, and with wonder and amazement depicted in his wrinkled features. Gradually a light appeared to burst upon him, and as soon as his visitor ceased, he exclaimed—

"Measter, oi said oi know'd summat o' thy face when thou came in, tho' oi couldn't say where I'd seen thee afore. I see now the look o' t'owd squire in thy eyes and mouth. I might ha' know'd when I first seed thee, but I thought thee dead long years agone. I know'd, as thou went on, as thou was tellin' me thy own story, and right glad I be to see the feace o' a Morton agin afore I die. Yet I don't understan'. Thou said thy name was Aston?"

"I did, my good old friend. Still I am Henry Morton, and I have told you briefly my own history. Aston was the maiden name of my wife, and I have assumed it to maintain secrecy until I think proper to come forward in my proper name. No one has yet recognised me but you. None other has any idea that I am living. You must keep my secret until I permit you to disclose it."

"I will, Measter Henry—wi' a' my heart, I will," replied the old man. "Ay, but I be main glad to see thee. And thou'lt have 'The Briers' agin. Thins verra cottage belongs to thee, Measter Henry."

"Yes, Matthew. But I shall not yet prefer my

claims to the property, nor make known the secret of my return. Above all, I do not wish the Foleys to know, yet awhile, that I am living, and in England. My first endeavour will be to find my sister, or her husband or children, if they or any of them be still alive. I thank you much, my good old friend, for the information you have given me, and for your kindly feeling towards my poor sister, and before I leave Fordham I will see you again. But, above all things, preserve my secret."

With this the *soi-disant* Mr. Aston placed a gift in the old sexton's withered palm, as he shook hands heartily with him, and having made the little girl—who had been absent from the room during the conversation, but who had returned on hearing the noise caused by the visitor's approaching departure—happy with the gift of half-a-crown, he quitted the cottage, old Matthew calling after him, as an earnest of his recollection of the trust reposed in him—

"Good-bye, Measter Aston."

"Who be that genelman, gran'ther?" inquired the child.

"Thou munna ax questions, lassie," replied the old man. "Nath'less o'ill tell thee who he be. He be a genelman come down from Lunnun to see th' owd folk as once lived at 'The Briers;' and now, Polly, thou knows, thou munna ax any more questions about un."

"WHAT'S THE PRICE OF CONSOLS?"

WHEN people invest their money in what are called the public securities, Government funds, or, for brevity's sake, "consols," they really purchase a debt of which they can never demand the repayment. They receive for their money so much *stock*, as it is termed—that is, so many shares in a debt due by the Government, but of which Government only undertakes to pay the interest, not the principal. The history of these securities, as well as the precise nature of them, may be briefly summarised as follows. Ever since the Revolution of 1688, it has been found that whenever this country has been at war the yearly levy of taxes has been insufficient to meet the expenses of Government. Consequently, to make up what was deficient, the ministers of the sovereign have usually had recourse to loans; in other words, they have borrowed money from persons who were rich enough to lend it, granting to such persons securities for the payment of yearly interest at a certain rate. The rate has varied at different periods, and would necessarily vary according to the plentifulness or the scarcity of money; but that variation would not affect the nature of the transactions. By way of illustration we will suppose that Government wanted to borrow a hundred pounds, and that a person is ready to lend that sum at five per cent. interest. The lender, on paying the money, receives a bill or bond which entitles him as long as he retains possession of it to receive yearly from the revenue five pounds for interest, on the condition of making no demand for the principal unless and until Government elects to repay it. The possessor of such bill or bond is termed the holder of a hundred pounds of five per cent. stock, and the money he has lent on the bill forms a part of the national debt, so called because it is a debt incurred by the nation, and the interest is paid out of the taxes. But probably few people would be found willing to part with their ready money on the condition of never demanding its repayment, even though assured that the interest would be punctually paid to them or their heirs. To meet this

objection, the lender who wishes to have his money back again, though he may not ask for repayment, is yet at liberty to sell his bill to any purchaser he can find for it, and for any sum which such purchaser can be induced to give him. In such a case the buyer becomes possessed of the right to receive the yearly interest, and of the right also to sell the bill to any other person whenever it shall suit his convenience to do so. Such purchases and sales are called transfers of stock, because the stock represented by the bill or bond is transferred from the buyer to the seller. But the value of money varies continually, and it will happen that a hundred pounds, which we have supposed to bear five per cent. interest, may be worth more than that, or, what is far likelier, considerably less. In the former case the buyer of the stock will have to give more for it, and in the latter case will get it for less. Suppose, for instance, that two or three persons have each a sum of money to place at interest, but find it difficult to do so; they will naturally compete with each other for the purchase of the bill in question, which secures to its possessor five pounds a year. The holder of the bill will of course raise his price, say to a hundred and five pounds. The buyer, therefore, pays a hundred and five pounds for a hundred pounds stock, so that instead of getting five per cent. interest for his purchase-money he gets little more than four and three-quarters. If, however, on the other hand, the holder of the bill is anxious to dispose of it, while there are but few buyers, he may be obliged to offer it for less than a hundred pounds, say ninety-five. The buyer in this case gets a hundred pounds stock for ninety-five pounds, which yields him interest at the rate of five and a quarter per cent. for his money. We have spoken of a hundred pounds merely for the sake of illustration; but the fact is that Government loans generally amount to millions: still the transactions between Government and the money-lenders would be precisely the same in the case of millions as in that of a single hundred. It must be plain, however, that even the wealthiest merchants, who are usually the lenders, cannot be expected to be in a condition to advance ten or twelve millions at once. They do not pretend to do anything of the sort. When they agree to lend the Government money—that is, when they contract for a loan—it is their custom to advance the money by instalments, or payments of certain portions at certain intervals, perhaps a million or two a month, until the whole is advanced. The Government gives them bills or securities for the money upon their advances, and these bills or securities they sell or transfer to persons having money to place at interest and who are willing to take them: in this way the money realised by the sale of the securities received for the first instalment of a loan enables them to pay the second, while the securities or bills go into the market, and rise or fall in value according to the demand.

There are a multitude of causes for the rise or fall in the market price of stock, but the one which has the greatest influence is doubtless the condition of the country as regards war and peace. In war times the price will be low because the Government will be frequently borrowing and sending fresh bills into the market; at such times prices fall, owing to a redundancy in the supply. In times of peace the price of stock will be higher, and not subject to the sudden fluctuations which characterise the war periods, because new loans are not likely to be wanted, no new bills are thrown on the market, and the interest coming due on old ones may be met by the taxes. The sudden fluctuations in price which occur in war time are due mainly to the nature

of the intelligence that comes from the scene of action; if the news is bad the price of stocks will fall, because the war is likely to be prolonged, and the Government is likely to borrow more money; if the news is good the price will rise, because the successful close of the war would put an end to borrowing and prevent any supplies of fresh stock. It is this variation of prices, and the possibility of controlling it in some degree, that has given rise to the unprincipled arts of stock-jobbers. Ever since there have been stocks to sell, there have been dealers in them who have had recourse to fraud in order to increase their own gains. In past times, when war was waging, they could operate more mischievously than they could now when intelligence travels so rapidly. Thus a man who wanted to sell would circulate reports of a favourable kind for the sake of getting the price up; and on the other hand one who wanted to buy would spread false news of disasters in the field for the sake of getting prices down; and either of them could reckon on the lapse of days or weeks before the falsity of the intelligence he had circulated would be discovered. The man who operated for the rise was called a bull, because he tossed up prices; and he who operated for the fall was known as a bear, because he trod them down. The history of the Stock Exchange, in past years, would, if fairly written, be full of frauds of this kind, and would show that princely fortunes have been gained by elaborate systems of lying and deceit, and gained too by men of high social position, who, having accumulated wealth, have had social rank thrust upon them by their admiring countrymen.

In the above brief summary we have supposed, for the sake of illustration, that Government securities bore five per cent. interest. That, however, is not the case now, as all holders of Government stock know quite well. Stocks are of different denominations, having been created at different rates of interest at different times. Some of the loans contracted at highest interest have been paid off. "The five per cents." have vanished long ago. The principal stock now is the three per cent. consols, which consists of several borrowings consolidated into one debt bearing three per cent. interest; and they probably amount to one-half of the national debt, or nearly so, at the present time. The remaining half is made up of stocks of different kinds, a list of which the reader will find every day in his morning paper; but the maximum interest is now three per cent., and the aggregate debt is not far short of £800,000,000.

The growth of this vast debt is a subject of no mean interest. Beginning in the reign of William III (1690), it had amounted in 1697 to about 5 millions sterling, and the Englishmen of that day were in consternation at its amount. In 1702 it had increased to 14 millions; in 1714 to 54 millions; in 1749 to 78 millions; in 1763 to 139 millions; in 1786 to 268 millions; in 1798 to 462 millions; in 1802 to 571 millions; in 1814 to 865 millions; in 1817 it was slightly reduced to 848 millions; in 1830 it was 840 millions; in 1840 it was 789 millions; in 1850, 787 millions; in 1854, 775 millions; in 1855, 793 millions; in 1856, 807 millions; in 1857, 808 millions; in 1858, 806 millions; in 1859, 805 millions; in 1860, 802 millions; in 1861, about 801½ millions; in 1862, 800 millions; in 1863, 799½ millions; in 1864, 790½ millions; and in 1865, about 786 millions. The sole cause of this frightful and astounding increase has been war. The interest of this huge debt is now about 27 millions sterling; it has to be raised by taxation, and is paid over half-yearly to about 350,000 holders of Government stock, fully two-thirds of whom, it is said, receive less than fifty pounds each a year.

We may remark in this place that it would be a great error to suppose that Government ever received the 800 millions of money for which it stands indebted to the fundholders. Governments, like individuals, are the victims of adverse circumstance, and when necessity compels them to borrow they must borrow on the best terms they can. If their credit is good, they may get loans on tolerably good terms; but if their credit is impaired they will pay dearly for accommodation. Again, money will be scarce when frequent loans are required, and governments, like individuals, must accept the deariness resulting from such scarcity. From one of these causes, or from both combined, it happened throughout our long wars that our rulers rarely, if ever, got a hundred pounds for their hundred-pound bond; lenders would not contract loans at par, and sometimes not even for five, ten, fifteen, or even twenty per cent. less. It is not at all easy to get at facts regarding our war loans, but it has leaked out that, under the administration of Pitt, some of the largest loans taken up to make head against the first Napoleon were done at sixty and even less than sixty pounds per hundred, so that the nation lost more than forty per cent. by such transactions! As all these loans were represented by stock, which has become the best security for dividends in the world, it is evident that most enormous gains must have been realised by the wealthy lenders who from time to time furnished the means for carrying on the war.

Consols have for centuries been regarded, and rightly regarded, as an index to the prosperity both political and commercial of the country—not that their rise in price, which is evidence of the public confidence in the Government, is evidence also of existing commercial success. It may happen to point to a contrary state of things, seeing that when speculation is rife, and money dear in consequence, consols will be low, because holders sell out in order to have the means of speculating; and on the other hand, when speculation has ended in panic, consols will rise because persons having money to invest prefer the certainty of three per cent. to the hazard of speculations by which they have so recently suffered loss. In a normal state of things, under the prosecution of a legitimate trade, consols would be as good a barometer to mark the changes of the commercial atmosphere as of the political one; because *bonâ fide* trade would result in industrial savings whose investment would send prices up, and the withdrawal of which would send them down. How thoroughly the prices of consols respond to the *vox populi*, and what an infallible test they afford of the state of public feeling, so far as that can be translated into figures, is best shown by a retrospective glance at their variations in value within the last hundred years. The three per cent. consols, which in 1749 stood at par (which means that a hundred pounds stock would sell for a hundred pounds), had in 1780 sunk in market value to an average throughout the year of £63; in 1785 the average was £68; in 1790 it was £71; in 1795 it was £74; in 1798, when we were gloriously sweeping the French fleets from the ocean, it sank to £59; in 1800 the average had only risen to £66; in 1805, the year of Austerlitz, it sank to £58; in 1810 it had risen to £67, and had sunk again to £58 in 1815. In 1820 the average was £68, and it had risen to £90 by 1825. From this year to 1852 the average of the year was never so low as £86, though great fluctuations sometimes occurred within the year, as notably in the time of the panic in 1847, when consols went down to £79. In 1852 consols nearly reached £100, and in the following year touched £101. In 1854 they went down as low as £85, but have never been so low as that since.

If the reader chooses to collate these variations in the price of consols with the facts of history, he can test the assertion we have made as to the correspondence between the welfare of the nation and the value set on its promise to pay. We have only been able to give the average of the year's variations in the above list—the particulars of each rise and fall not being accessible to us—so that the lowest price of consols is not shown in any one of the years. The Government securities, it is said, reached the lowest point at which they were ever sold in 1798, during the mutiny at the Nore, when crowds of timid fundholders, rushing to sell out under the notion that the country was going to ruin, bore down the price to forty-seven and a fraction. The funds have often been temporarily depressed by the tricks of stock-jobbers, and perhaps have been as often raised in value for a time by the same means. The most memorable hoax of this kind was exploited in 1813, for which Lord Cochrane, Admiral Johnstone, and others were tried and convicted in the following year. Lord Cochrane was expelled the House of Commons; but many years afterwards his innocence was proved and he was restored to his rank and honours. It does not appear that the real perpetrators of the crime ever received their due: it is an awkward fact that offences of this sort scarcely ever bring down the merited retribution.

"What is the price of consols?" is a question of very general and permanent interest. No man need ask it in vain, for the answer to it is published in five hundred newspapers every day of the week, which fact alone speaks to its universal importance. The trader asks it when he thinks of extending his business, or embarking in some venture whose success or failure will be determined by the rate at which he can borrow the capital necessary to carry it on. The fundholder wanting to sell out asks it, and he asks it fifty times, perhaps, before he does sell out, consulting the share lists day by day, watching the sluggish rise of his darling stock, and forbearing to issue his fiat until it shall have touched the point at which it will pay him to convert his scrip into cash. With a like feeling the question is asked by the investor who has money to place out—only he watches for the fall, not the rise, and delays to buy in until the rate has declined to a point at which his investments will yield what he considers a fair interest for his money. The managers and directors of public companies ask the question continually; some of them have immense funds to operate with, the deposits of their shareholders, or their accumulated gains, and, watching the turn of the market, can, and often do, realise considerable sums by taking advantage of it. The speculating stock-jobber puts the question with as keen an interest as any one; to him the rise and fall of stocks is the one subject of paramount and vital importance. Perhaps he does not possess a single pound of stock in the world, but he buys and sells continually—is always buying and selling, but never touches bond or bill, or it may be sees a rag of scrip, from one year's end to another. In the technical phrase of the market, he buys or sells on account—that is, he makes a bargain to-day which is to be implemented on some future specified day, but whether to his gain or loss he cannot tell. Suppose, for instance, that A sells to B a certain amount of three per cent. consols, to be delivered on this day month, and fixes the price at £94. If, when settling-day comes, the price of consols shall have fallen to £92, A will be able to buy stock at £92, and B will have to take it at £94, so that A will have gained two per cent. on his transaction. If, on the other hand, the price had risen by settling-day to £96, B would be entitled to have it at £94, and A would lose

two per cent. In either case no stock passes between the parties to such a transaction, which is completed by the loser paying over to the winner the sum due to him. The reader will see that this is pure gambling, and nothing else. The reason why men engage in it may be that they fancy they have more skill than others in forecasting events, or that they have, or imagine they have, some control over the market, so as to raise or depress prices to suit their own purposes.

In foreign countries the state of the English funds is always a subject of interest more or less. The Continental politician gauges our prosperity by the buoyancy of our public stock; and the foreign potentate contemplating a loan, and knowing that if he gets it the largest share will come from British sources, sees in the price of consols an infallible index of the state of the public purse. Further, the fluctuations in price of our Government funds have a moral as well as a financial significance. Consols will go down in seasons of national depression and foreboding, as surely, if not as rapidly, as in the face of actual calamity. There have been times when a word spoken at the Tuileries has sent them down as with a sudden shock, and at other times they have fallen continuously, from the growth of public dissatisfaction, and distrust of cabinets and men in power. A striking instance is on record of the belief entertained by the people of the United States, as to the correspondence between the price of consols and the state of public confidence existing in England. In 1848, the year of European revolutions, the popular party in New York took it into their heads that the Britishers were in a state of panic, and the ministers of the Crown at their wits' end. The latest news from England was hungrily sought after and ravenously devoured; and, whenever a mail-steamer hove in sight, despatch-boats were sent out to meet her and bring in the news, which was thus circulated an hour or two sooner than it would have been in the ordinary way. When the great Chartist meeting was announced it was thought the crisis had come, and the excitement was consequently at its highest pitch. A man with stentorian voice was hoisted on a barrel, and commanded to read the news, the eager crowd flocking around him to hear. He opened the paper and read—first a portion of a leading article, which was soon cut short by the listeners—they didn't want that, they said—then a portion of a speech in Parliament, which was cut short even sooner, being still less to their taste. The reader, at a loss how to act, turned the paper over and over, shouting out a word here and a sentence there, amidst the murmurs of the crowd, who wanted to come to the point, but could not see their way to it. At length a man bawled out, "What's the price of consols?" All present felt that he had struck the key-note in asking that question, and it was immediately re-echoed from side to side. The reader turned to the money article, and in a loud voice quoted the price of stocks in London at the time when the political excitement there had been at the highest. Every man who heard it had his answer: the fluctuation of stock had been but trifling during the whole period of excitement; and all knew that the Britishers had not taken the anticipated panic, but still retained their customary coolness and composure.

OUR SISTERS IN JAPAN.

OUR Sisters in Japan lead lives far less secluded than is generally the custom with women in eastern countries; their feet are not distorted so as to prevent easy loco-

motion, like those of our sisters in China whose manners have already been depicted in the pages of the "Leisure Hour" (March, April, and May, 1863), nor are they shut up in dreary harems, having no intercourse with the outer world, like the women of Mohammedan countries; but all classes are permitted to mix freely in society, without let or hindrance; and it is no unusual thing to meet ladies in the streets attended by their servants, or carried in a norimon—a most peculiar and uncomfortable kind of conveyance. As single women they are allowed to associate with their friends and relatives, both male and female; and when married the utmost confidence is placed in them, they can come and go as they please.

Their appearance is very pleasing and eminently lady-like, even women of the lower classes possessing as a rule that refinement of manner and grace of movement which amongst ourselves is the proof of high breeding. They are very short, generally less than five feet in height, with hands and feet proportionably small. Their countenances are often charming, the black hair, always so carefully arranged, framing a delicate oval face, clear complexion, dark liquid eyes, and pretty nose and mouth. They move about very gracefully, notwithstanding their rough sandals and long draperies. The musical language of the country loses none of its melody from their pronunciation, for their voice is low and sweet, always an excellent thing in woman.

It is pleasant when climbing a green hillside, or exploring a lovely valley, to exchange a cheerful "O hy o," or "Good morning," with mothers returning from market, or leading their little ones to visit some relative in a neighbouring village.

The men give utterance to none of those contemptuous expressions with regard to the female sex which are so frequently heard in China, nor does a Japanese ignore his wife and family, but readily enters into conversation respecting them. The women in consequence of this have a frank self-reliant bearing, which shows they are treated as rational beings, although they are not entirely on a par with men, being dependent on their male relatives, and unable to hold land, give evidence, or enjoy any position of rank.

The freedom of intercourse women enjoy in Japan is, however, not without its drawbacks, and leads to many evils, which will ever be the case where the pure morality of the Gospel is not known or not acted upon. The depravity of human nature vitiates all that is most lovely and pleasing, unless its tendencies are governed by Christ's precepts; and thus, in a highly civilised heathen country like Japan, where women are almost on an equality with the men, the very association which ought to refine and elevate the whole moral tone of the community has unhappily produced a freedom of conversation and manners which is positively repugnant to a Christian mind.

JAPANESE HOUSES.

These are of very light construction, and consist generally of a ground floor with one storey. The house is raised about three feet from the ground. A verandah runs all round and gives access to the various rooms, which are separated from each other by sliding panels of wood-work covered with translucent paper. These are either windows, doors, or walls, according to the purpose to which they are applied. For instance, a room is shut up—that is to say, the paper framework panels close it in on every side. To obtain an entrance you have only to step on to the verandah, push aside one of the panels, which runs very easily in its grooves, and pass into the room. The floors are covered with beautiful soft mats, made of very finely plaited rice straw, about two inches

JAPANESE HOUSE. FROM A NATIVE PAINTING.

thick, and bound along the edges with a dark blue cotton material. Each mat measures six feet by three feet, and rooms are always made of the size of so many mats; and thus the room is made to fit the carpet, instead of *vice versa*, as with us. The exterior of the houses, with their framework of dark-stained wood, and high-pointed roofs, reminds Europeans of Swiss chalets. Bricks and stones are not used in the construction of Japanese dwellings, on account of the frequent occurrence of earthquakes, which would render too substantial houses dangerous residences; but wood entering so largely in the erection of these buildings renders them very inflammable; and in consequence, if a fire breaks out in a closely populated neighbourhood, it often spreads far and wide and consumes whole districts before it is possible to extinguish it. Fireproof buildings, or rather those which are supposed to be so, are made up of chunam, a mixture of lime and dried mud. The wooden framework is thickly covered with this compound, over which a smooth facing of fine white plaster is worked, which resists a certain degree of heat, and, therefore, godowns, or what we should term warehouses, for storing valuable goods, are built of it. The interior of a Japanese house is particularly comfortable in appearance, although destitute of "furniture," in our acceptance of the word. The floor is covered with the clean soft mats we have already mentioned; the ceilings are often panelled in good carved work. The accompanying sketch, from a native painting, will give a fair idea of a Japanese ladies' house. The projecting verandah, surrounding and connecting the detached portions of the residence, also protects the slight paper frameworks from the rain. Two of these panels are open on the upper storey, and two ladies have just come out from one of the rooms, and are speaking to a coolie, or man of some lower class, who is on his knees before them, the usual attitude of inferiors when in the presence of persons of superior rank. The elegantly dressed lady whose head appears to touch the woodwork of the upper verandah is looking on to the courtyard, where dwarfed trees and flowering shrubs are planted, and ponds with gold fish are often found. A female servant is on her knees, and has apparently a picture in her hand to show her mistress. The lady in front, whose head-dress is so elaborate and porcupine, has her basket on a mat on which she has been sitting *à la Japonaise*—i.e., on the heels. Lanterns are suspended at frequent intervals, and these will be lighted at night with fish oil. It will be clearly seen from this drawing how largely wood enters into the construction of a Japanese dwelling; every part is admirably fitted to the other, and each joint is neatly morticed, for the Japanese are excellent carpenters.

GARDENS AND COURTYARDS.

In the lower compartments of the houses and shops, the paper walls are generally pushed aside during the warm weather, and persons passing through the streets can see the courtyard at the back of the house. Here stands of flowers are arranged all round, bamboos and orange trees shade the miniature garden, and there is frequently a small pool of water, in which a kind of peculiarly delicate gold and silver fish are seen swimming about. Some Japanese ladies take great pains with their potted plants, those with variegated leaves being especially prized, and, by a curious system of dwarfing, forest trees are rendered small enough to be held in ordinary sized flower-pots. At Nagasaki, the chief of the Dutch interpreters, Metoske, has a valuable collection of plants in a space not larger than a London drawing-room. When it was shown to us, Mrs. Metoske seemed to share her

husband's botanical and horticultural tastes, and took as much interest as he did in displaying the pretty plants. One of the most beautiful of the hoyas, or wax flowers, is a native of Japan, and received its specific name from this Japanese, and is called the Hoya Metoske. A picture of it, from one of the English botanical works, was hung on the walls of his sitting-room, and he and his wife seemed very proud that it should bear his name.

Large spaces of ground surround the residences of the superior classes, and are kept in exquisite order, like the parks and gardens of our own landed proprietors. The various portions of the dwelling, which frequently cover a considerable space of ground, are connected by means of rustic bridges thrown over artificial ponds, where small islands, with lovely flowering plants, are placed. Japan is the natural habitat of the azalea and camellia, which there attain a size and beauty unknown in other climes. The delicate white-flowering azalea mingles its pure blossoms with the deep magenta and exquisite rose-tinted varieties; and in spring the gardens are rendered gorgeous by enormous masses of these lovely shrubs, which grow in the open air to a height of fifteen or twenty feet. The camellia, too, is very large, many of the double blossoms measuring nearly five inches in diameter, while the tree bearing the single blossoms is thirty and forty feet high, reaching almost the dimensions of a forest tree. The Japanese ladies often dress their hair with sprays of the azalea, whose rich colours contrast well with their dark hair. Orange and lemon trees shed their perfume on the air, and tall dark firs and bamboos afford a delightful shade during the heat of the day. Terraces commanding beautiful views, rock-work from whose crevices spring waving ferns and velvety cyclamen, trickling streams conducting the rivulets down the hillsides, all give charm and variety to these delicious spots, where the Japanese ladies pass many pleasant hours.

FURNITURE.

The rooms are, as has already been mentioned, almost destitute of furniture. The dining-tables are about six inches high and fifteen to eighteen inches square. These are placed on the clean mats. The guests seat themselves round, and partake of the savoury messes from variously-shaped cups and basins. The position they place themselves in is peculiar: their legs are doubled up under them, and they sit resting on their knees and heels. Custom enables them to continue thus doubled up for a long time in an attitude which a European finds absolutely unendurable. Chairs are entirely dispensed with, though a sort of low form is occasionally used. Bedsteads are unknown. Here again the mat comes into requisition, and sleepers place a small bolster on the ground, wrap themselves in a warm quilt, and slumber on what we should term the bare floor. Screens are sometimes used; they are made of a framework of wood, and covered with paper, whereon are painted flowers and birds, the attitudes of the latter generally being very beautifully and faithfully portrayed. To furnish a house is a matter of but little difficulty. A few pots and pans, cups and basins, with a fire-box to contain charcoal and keep the pot boiling, a set of drawers, and perhaps a picnic basket, will serve to start a modest establishment when once the house is complete and the mats are arranged.

Teapots and teakettles are, in fact, amongst the first requisites of furnishing. These are of various shapes and sizes, chiefly of earthenware and china, with occasionally bamboo handles. If the tea, the beverage in ordinary use, is to be drunk at once, it is made by

pouring boiling water on a small quantity of tea in a cup, and covering it over for a few minutes with a small saucer; teapots are only used when it is wished to keep some ready at hand. The kettles in the tea-houses are very large, made of copper, and capable of holding many gallons of water. To keep the water boiling a chamber is constructed in the centre of the kettle, and filled with burning charcoal. The vessel is suspended from a framework, and, like our swinging table tea-urns, is nicely balanced, and can be easily tilted to pour out its contents.

LANTERNS AND CANDLESTICKS.

These also are so essential as to deserve a separate heading in describing the furnishing of a Japanese house.

Lanterns form conspicuous objects in the decoration of Japanese houses and temples, both externally and internally; and they are ornamental by day as well as by night.

Some are globular, made of paper, stretched on thin pieces of bamboo, painted with pictures of flower-stalks, figures, etc.; lacquer work forms the solid portions to which the other parts are attached; and silken tassels of various colours depend from the bottom. Of this kind are the lanterns suspended in the verandah. At the centre of the lower piece of lacquer, a sharp iron spike projects, on which the candle is stuck. Candles are made from the vegetable wax tree, or *Rhus Succedanea*; a rush forms the wick, and into this the spike at the bottom of the lantern passes, and supports the candle during combustion.

The common folding lantern is made of thin rings of bamboo of two sizes; paper is gummed from one ring to the other, and the whole can be shut up flat when not required for use.

There is also a curious

bronze candlestick in common use, which is equally economical of space. Two of these were sent over to England with a number of other curiosities; but their use could not be divined, till a former visitor to Japan solved the problem, and unfolded the candlestick. Other candlesticks remind one of the grotesque bronzes recently manufactured in Paris. For example, we give one formed by a crane, standing on a tortoise, and holding a lotus flower in his mouth. The idea is certainly pretty. Candles are also sheltered from the air by every variety of protection of paper and bamboo that can be devised.

CURIOSITIES OF ISLINGTON.

BY JOHN TIMBS.

I.

ONE of the most remarkable returns in the last census of the population of the metropolis is that showing the vast increase of the ten years in the suburbs; of which the extensive parish of Islington showed an addition of

within 32 of 60,000 souls; the excess of births over the deaths in the same period being 15,881, and the entire population in 1861 being 155,291. Now, the increase of St. Pancras in the ten years, in a population of 199,000, was little more than half that of Islington. These facts and figures explain the great stream of traffic which is ever pouring into and through Islington and its leading thoroughfares after nightfall; and it is not too much to expect that the Parliamentary return of the "lodgers" will be more numerous in Islington than in any other metropolitan suburb. The parish is reckoned to be sixteen miles in circumference.

The name "Islington" seems to be a vernacular corruption of *Yseldon*, anciently pronounced and written *Bysseldon*; but we find it written *Islington* certainly before the reign of Edward IV, when one of the judges of the King's Bench rode to Islington (*chevaucha à Islington*) and interrogated a woman on her death-bed in the case of an appeal of murder, as reported in the Year-book of the period. The name has a host of etymons, amongst which the Saxon derivation, according to Sharon Turner, is *Ysseldune*—i.e., the Down of the Yssel—taken to be the original name of some river, most likely the River of Wells, which joined or fell into the Fleet River. Another derivation is from the British word *Isheh*, lower, and *don* (from *duyn*), a fortified inclosure, inferring that *Iseldon*, according to that interpretation, meant the Lower Town or Fortification; and Mr. Cromwell seems to favour this derivation as agreeing with the site of the original village. The various other etymons given in Mr. Edlyne Tomlins' "Perambulation of Islington" are curious and interesting, as is every page of that treasurable work.

Upon the arrival of the Romans in Britain, when a thick wood stretched over the summits of the sister hills of the modern Hampstead and Highgate, the conquerors penetrated the dense forest of Middlesex, and civilised the barbarous inhabitants. The Romans formed works of importance within the limits of the present parish of Islington. They had a camp in the fields, near the present Barnsbury Park, and a summer camp at Highbury. "It is not very long since the camp at Barnsbury could be clearly traced; and within the last few years a stone with a Roman inscription has been found in a field at no great distance from the Barnsbury Camp, on the side of the Caledonian Road." (Lewis's "Islington as It is and as It was, 1854.") This inscription stone was found in 1842, upon the remains of Reedmont or Redmont Field, a camp of Suetonius Paulinus, between White Conduit House and Copenhagen House. Arrow-heads and figured pavement were also found at Reedmont in 1825; and one of the streets off the Caledonian Road is appropriately named *Roman Road*.

Before the Saxons were mingled with the Britons, rude habitations had no doubt been raised, forming the original hamlet of *Iseldon*. From the richness of the soil, the parish must have been at a very early period one of the chief sources from which London drew its supply of agricultural produce, and its meadow or pasture land, gardens, and nursery-grounds, must have been extensive; but these have mostly been cleared for the sites of streets and roads. The meadow, such as remains, is used as grazing-land, and occupied by cowkeepers for the purpose of feeding milch kine. "In fact," says Mr. Tomlins, "the land on the north side of London has been so applied from time immemorial." Its rich dairies are of great antiquity. Nay, we find, three centuries ago, the Squier Minstrels of Middlesex glorifying Islington with the motto, *Lac caseus infans*; and in 1628, Wither sung:—

"Hogsdone, Islington, and Tothnam Court,
For cakes and cream had then no small resort."

Islington was also famous for its cheese-cakes and custards; and cheese-cakes made at Holloway were cried about London by men on horseback. Islington still retains much of this kind of trade; and there is scarcely a suburb which so abounds with confectioners' shops and those of dealers in buns and cakes—just as Banbury is noted for its cakes, and, for the same reason, the rich nature of the soil.

The most ancient highway, connecting Islington with London, was that by Goswell Street, in Stow's time "replenished with small tenements, cottages and alleys, gardens, banqueting-houses, and bowling-places. Then the way stretched up towards Iseldon; and on the right hand, or east side, at a red cross, turneth into Old Street, so called for that it was the old highway from Aldersgate for the north-east parts of England, before Bishopsgate was built." Old Street was an old military road of the Romans. Another ancient road to Islington is Brick Lane, continued by the Bridle Lane or Bridle Way, the rough Frog Lane, to the Lower Road. Gerard, in his "Herbal," alludes to this road as follows:—"Our ordinary mustard, as also the mild and small, may all three be found on the banks about the back of Old Street, and in the way to Islington." Goswell Street Road is described by Strype as stretching up "towards Iseldon, commonly called Islington, a country town hard by, which in the former age was esteemed to be so pleasantly seated, that in 1581 Queen Elizabeth on an evening rode that way to take the air, where, near the town, she was environed with a number of begging rogues (as beggars usually haunt such places), which gave the queen much disturbance."

On the left-hand side of the High Street, Islington, it will be remembered, is a raised causeway, which has immemorially led from St. John Street end to the church, and was formerly called the *Long Causeway*. This extended below Sadler's Wells, and must have been very ancient; for Richard Cloudesley, 13th January, 1517, makes a bequest to the repairing of the causeway between his house and Islington Church; his house being "much above where the 'Angel' now stands, or perhaps a little lower down." Cloudesley was the great benefactor to Islington, and, among other bequests to the parish, he left to poor men gowns with the names of Jesu and Maria upon them; also a load of straw to be laid upon his grave. But superstition would not let Cloudesley's "bodie rest, until certain exorcisers, at dede of night," had quieted him "with diuers diuine exorcises by torchlight." The name of this benefactor is preserved in Cloudesley Square and Terrace.

The Saxon village of Islington has been placed by antiquaries chiefly on the sloping ground by the Lower Street, the neighbourhood of which—especially the narrow ways, such as Elder Walk—retains the irregular features of old thoroughfares in ancient towns. There stood the Saxon parish before the coming of the Normans. "As early as the second century Christianity had rejoiced many hearts in Britain; and the subsequent arrival of St. Augustine was gladly hailed by the victorious Saxons, who had refused to learn from, or had been too much disregarded by, the enslaved and irritated British Christians."—(Lewis's "Islington.")

It is a long leap from these early times to an institution of the thirteenth century, when one of the family of Berners (whose name is given to a recently built street in Islington) presented to the Prior of the Canons of St. Bartholomew, in West Smithfield, a manor, as a bury, or retiring place; and the estate thenceforth bore the name of *Canonbury*. The monks were thrifty cultivators of the productive soil, and moreover pro-

vided the Priory in Smithfield with a conduit-head, the water running in leaden pipes; and we are told that it was much prized for its clearness and purity. The manor retains its boundaries to the present day, its waste being the triangular plot of land called Islington Green. The oldest portion remaining of the buildings, re-edified by Prior Bolton, whose rebus, sculptured in stone—a bird-bolt through a tun—is still perfect and visible in one of the buildings—

"Old Prior Bolton with his bolt and tun"—

is Canonbury Tower, a square red brick tower, fifty-eight feet in height, and a fine specimen of brickwork. The adjoining houses are of various dates. At the dissolution of the monasteries, the priory and manor were granted to Thomas Cromwell, Earl of Essex; they were next settled by Henry VIII on Anne of Cleves, who received for the property an annuity of £20 until her death. The manor was then granted to John Dudley, Earl of Northumberland, father-in-law to Lady Jane Grey; Broke, Chief Baron of the Exchequer; and Thomas Lord Wentworth; and by the latter sold for £2000 to Sir John Spencer, of Crosby Place, whose daughter and heiress married William, second Lord Compton; the lady is said to have eloped from her father's house at Canonbury, in a baker's basket! When the estate was in Spencer's possession, Sir Walter Raleigh is said to have lived here; it is more certain that he lived on the manor, it is believed in a house near the site of Islington Chapel. Among the subsequent residents at Canonbury House was Lord Chancellor Ellesmere, Lord Chancellor Bacon, Lord Keeper Coventry; James, Earl of Northampton; and Viscount Fielding, Earl of Denbigh. In the last century lodged here Chambers the Encyclopædist; in the Tower House lodged two years Oliver Goldsmith, and here he wrote his "History of England, in a Series of Letters from a Nobleman to his Son." From the roof of the tower may be enjoyed, in fine weather, an interesting view of London. The tower has recently been taken by the Church of England Young Men's Society, and fitted up and furnished as a resort for the leisure hours of the members of the Society. When the view from the tower was unobstructed by other buildings, and in the midst of a park and gardens, with a fish-pond and other accessories, the estate must have been a charming retreat. The site is now nearly covered with houses, of which the Marquis of Northampton is the ground landlord. Still, Canonbury Tower remains one of the curiosities of old Islington.

There was long believed to have existed a subterranean passage from Canonbury to the Priory of St. Bartholomew in Smithfield: such was the tradition, but, upon the opening of the supposed passage, it was proved, not many years since, to consist of a water-course, which is specified in a grant made at the suppression of the Priory, as "the water from the conduit-head of St. Bartholomew, within the manor of Canonbury, in the county of Middlesex, as enjoyed by Prior Bolton and his predecessors."

The Green was granted to the parish by the Marquis of Northampton in 1777, eight years before which the watch-house, cage, and stocks were built here. Less than a century ago, Islington, in prints, consisted of the High Street and Green, and houses at intervals here, as well as in the Lower Street, as far as the Thatched House. Building progressed but slowly, and Islington was then almost as solitary, and as much exposed to depredation and robbery, as it is certified to have been a century previous. "Surrounded by the fields," says Tomlins, "although connected by the highway of St. John Street Road with London, the appearance of Islington was

pleasant; nay, one topographer, not more than fifty years since, styled it picturesque."

Aged persons there are who recollect the High Street and Lower Street lined on each side with trees, like a boulevard; several large elms then stood opposite the "Angel" and "Nelson" Inns. And Islington had a rural aspect in the hay-making season. The ancient houses and inns were mostly, in former times, the residences of the nobility and gentry from the time of Henry VIII to the end of the reign of Charles I. The "Angel" resembled a large country inn, with a galleried court-yard, as shown by Hogarth in his print of "A Stage Coach," 1747. A water-colour drawing of the inn was hung, within our recollection, in the coffee-room of the present inn, which was built in 1820. It stands ninety-nine feet above Trinity high-water mark. The "Angel" Inn was formerly noted as a halting-place for travellers approaching London from the north, who, if they arrived after nightfall, generally waited till the morrow for fear of the thieves, who robbed, and sometimes murdered, persons at night on the road beyond leading to the metropolis. Persons who had to cross the fields to Clerkenwell usually went in a body, for mutual protection, and a bell was rung at the "Angel" to assemble the party before starting. And persons walking from the City to Islington in the evening, waited near the end of St. John Street until a sufficient party had collected, and who were then escorted by the armed patrols.

The "Peacock," a long-roofed and capacious building, bore the date of 1564. The "White Lion" figures in "Barnaby's Journal"—

"Veni Islington ad Leonem—
Thence to Islington, the Lion."

The "Pied Bull" was the abode of Sir John Miller, in the time of James I. Three other houses may be noted here. Near the Green, the "Duke's Head," kept by Topham, the "strong man of Islington," in Frog Lane, the "Barley Mow," where George Morland painted some of his pictures; and the "Old Boar's Head," in Upper Street, where Henderson, the tragedian, first acted. Opposite Rufford's Buildings, previous to 1812, there existed a large wood-framed mansion, dated 1688; and in Oldys' and Birch's "Life of Sir Walter Raleigh" this is stated to have been one of his residences. The "Three Hats," near the turnpike-gate, was noted for its equestrian performances before either Astley or Hughes; it was taken down in 1839. In Lower Street were more ancient mansions than on the upper side of High Street. We remember the "Queen's Head," curious and picturesque, of the time of Elizabeth, with projecting bays and porch, taken down in 1829; an old oak parlour has been preserved. Fisher House, a brick-built mansion, of the time of James I, stood opposite the end of Cross Street; and slight remains of Ward's Place exist in Greenman's Lane. Ward's Place was also called Hunsdon House, from having been the residence of Henry Carey, cousin to Queen Elizabeth, created Lord Hunsdon, 1559; and from the quarterings of Sir Robert Dudley, Earl of Leicester, having remained in a window of this mansion, it is probable that at some time he resided here. At the "Crown" public house, in Lower Street, long since taken down, Goldsmith met his club, while he was lodging at Canonbury; it was a curious old place, with painted glass, apparently of the reign of Henry VII, namely, the "Mercers' Arms," the demy virgin in which was mistaken for a portrait of Elizabeth, Henry VII's queen. In Cross Street also was the residence of the Fowler family, taken down in 1850; and at the extremity of what was the garden there yet stands a brick edifice that, till the last forty years, looked over

what were then Canonbury Fields; this edifice was called, though without authority, "Queen Elizabeth's Lodge;" it was built by Sir Thomas Fowler, and bears his sculptured arms and the date 1653.

"White Conduit House" takes its name from the white conduit, built as a reservoir to the Charter House, to which place water was conveyed by pipes. It was built in 1641, and bore the arms of Sutton, of Charter House; and it was granted to the monastery for the herbage of land in the manor of Barnsbury and the reserved rents. The conduit was arched, and built of stone, flint, and brick, and cased with *white* stone, whence its name; it remained until about 1812, after which it fell into decay, was stripped of its outer casing, and in 1831 was destroyed to make way for some new buildings in Barnsbury Road. The conduit stood upon part of the site of the house No. 10, Penton Street, the original spring being at forty-three perches west from the "Conduit House;" remains of the connecting brick channel were discovered some twelve or fourteen years since, and the leaden pipes have been met with about Pentonville. This conduit gave name to a house of entertainment, well known in the last and present centuries. The old house stood on the east side of a foot-path in the line of Amwell Street. A Grub Street poetaster of 1760 celebrated the "tea and cream and buttered rolls," and "china and gilt spoons," of "White Conduit;" and we remember its old garden, fish-pond, fountain, and grotesque costume figures, its assembly-rooms, garden, etc. Goldsmith, in his "Citizen of the World," describes "White Conduit" as a place where "the inhabitants of London often assemble to celebrate a feast of hot rolls and butter." The loaves grew into such repute as to be cried about the streets of London as "White Conduit loaves," prior to the rise in the price of bread, brought about by the French revolutionary war. Goldsmith was a frequenter of "White Conduit," and here it was that he treated the tradesman's three daughters to tea, and then discovered that he had not money to pay the bill. The gardens flourished, and in 1826 one of the attractions was M. Chabert, the fire-eater, who, after a luncheon of phosphorus, arsenic, oxalic acid, boiling oil, and molten lead, walked into a hot oven, preceded by a leg of lamb and a beef-steak; on the two last, when properly baked, the spectators dined with him. Graham ascended from here several times in his balloon; followed by fireworks. The house was then rebuilt, with a room to dine 2,000 persons, and opened in the summer of 1829; but within twenty years the large premises were taken down, and upon a portion of the garden were built a much smaller tavern, and White Conduit Street adjoining. Fourteen acres of land next White Conduit Fields were devised by Richard Cloudesley, in the year 1517, for the benefit of the poor of Islington parish. The estate now yields upwards of £1,000 a year in ground-rents. In White Conduit Fields was the cricket-ground of the White Conduit Club, who laid down the first rules of cricket, which are the basis of the laws of cricket to this day; and one of the attendants was Thomas Lord, who subsequently formed "Lord's Cricket-ground."

Where the "Belvedere" Tavern, facing the Pentonville Road, now stands, was formerly the site of "Busby's Folly," whence, every May, a club marched in mock procession to Highgate, bearing upon a staff a pair of horns, having reference to an ancient passage-toll levied upon horned cattle, and gathered by some park-keeper or manor-bailiff, who bore the above emblem of his office. The "Belvedere" has long been noted for its racket-grounds. Nearly opposite is "Dobney's Place," which

keeps in memory Daubigny's Gardens, noted for equestrianism; here, too, Wildman exhibited his docile bees in 1772.

Copenhagen House, upon the site of the London Cattle Market, was first opened by a Dane, and is named in Camden's "Britannia;" it was noted for fives and tennis to the day of its removal.

Among the more important notabilia of Islington is the tunnel, 970 yards (half-a-mile and ninety yards) in length, through which passes the Regent's Canal, *under the town of Islington and the New River*, and emerges into what was the field adjoining the City Gardens; where the water is received into a basin 1600 feet long by 110 feet wide, covering with its wharfs an area of twenty-five acres.

Islington has been, from the earliest times, the abode of many notable persons, to be hereafter noticed, with the institutions and other means by which the place has attained its importance as one of our great suburban centres.

THE BATTLE OF THE BEES.

BEING witness to the results of a remarkable phenomenon last autumn, and only regretting that it occurred without the complete observation of any competent naturalist, I am induced to offer the best account I could gather of what I have faithfully called *The Battle of the Bees*! And first let me say, that anything similar is unprecedented and unknown to the oldest inhabitants, gentle or simple, in this part of the country.* Therefore I am inclined to think the circumstances sufficiently extraordinary to deserve a report. Having accidentally seen the effects, I was curious to ascertain the cause, and the following narrative is the embodiment of the answers to my inquiries from the gardener, under-gardener, and one of the household servants.

Before presenting it, however, I must describe the position of the battle-field. A lawn and pleasure-grounds, of handsome extent, and enriched with flower-beds and flowering shrubs, was the seat of the apiary involved in the catastrophe. It consisted of three square box-hives, united on the same platform, and each glazed at the back, with a wooden slide opening to admit the works of their industrious inhabitants to be viewed in progress as they formed their combs and filled their cells. A single straw hive (which was not molested) stood near, and the whole were in most prosperous order, with the bees healthy and strong; as well they might be with the heaths on Harrow Weald and Stanmore Common close at hand to supplement their own abundant food in wood, field, and garden. Such was the *status quo ante bellum*.

Wednesday and Thursday, 21st and 22nd of August last, were two of the fine, warm, and sunny harvest-weather days which gladdened so important a portion of that month. About noon, on the 21st, the gardener noticed the large triple hive darkened, and instinct with the movements of a myriad of bees. He fancied that a swarm was being thrown off, but, on approaching the scene of action, discovered that the whole appearance was owing to a furious contest between the bees under his care (the family were from home) and the bees, as he inferred, of a foreign invasion, apparently assailing the centre hive with indomitable rage and perseverance. Every post, and pillar, and vantage space was crowded by them, and charge after charge upon the defenders of their sacred home was incessantly iterated with desperate courage and repulsed. The great point

attempted to be forced was the entrance to the centre hive; and, except that its warriors were on the outside of their wooden walls, nothing could more accurately represent the determination to storm a fortified place, only defeated by the bravest resistance of the besieged. The method of the defence, too, was very remarkable, as an example of insect (marvellously resembling human) strategy. Across and on each side (shall we say?) of the gateway, the hiveites were drawn up in strong lines on the platform, and opposed, as it were, a disciplined phalanx to the enemy; and the enemy, on their part, never ceased to form in sections or divisions, and rush to the encounter to break the lines and penetrate the hive. These feats they often partially effected. At and near about the entrance the struggle was astonishing, and the slaughter immense—the slaughter of the invaders, for there were no dead observed among the defenders. On the contrary, they were vindictively employed in overpowering and murdering their foes, and dragging and pushing them to the edge of the platform, and throwing them over upon the grass. In this way they made three heaps of the slain, one nearly opposite to each entrance, and of some variety. At one end the hecatomb was so large that you could lift the dead bees up in double handfuls (in short, by hundreds) at a time. At the other end the tumult was not so great, and at the centre the deposit of the killed was intermingled with many fragments of apparently broken, coarse, or formative wax. Two or three of the hive bees were generally engaged in the killing of one of their adversaries, and joined in hauling the victim of many vicious stings to the overthrow from the platform. Meanwhile the battle was tumultuously raging about the centre opening, into which if any of the attacking party succeeded in entering, they seemed to be immediately dispatched and brought out for disposal along with their butchered comrades. Knowing what we do of bee order and discipline, it is not in the least unlikely that the body employed as executioners and throwing over the dead were specially appointed for the service, and that no warrior ever stepped out of his ranks to assist in the office.

This continued all Wednesday afternoon. "No slackness was there found." The combat was going on till the shades of evening fell upon it, and the gardener left them still fighting when he went away, at the darkening of night. In the morning of Thursday, little or no change was observable; and, throughout the day, the battle was furiously contested. One different manoeuvre was noticed, viz.: bodies of perhaps fifty or sixty of the assailants flew off, hotly pressed by a posse of the home bees, by which they were pursued, pounced upon, and knocked down, and immediately followed to the ground and put to death. The lawn and gravel walks were extensively sprinkled with their remains, and a considerable number were found destroyed in a greenhouse and a garden toolhouse, not far from the spot—the latter, however, being on the other side of a high wooden paling fence, with shady trees, so that the flight and pursuit were as obstinate as they were hot and merciless.

On Friday, the 23rd, the battle had ceased, and the field was clear of combatants. Unfortunately, neither the commencement nor the termination of the contest was noticed; and, two days later, viz., the 25th, when the tale was told to me, I could only observe the entire corroboration of its truth in the multitudes of slain I have mentioned on the three tumuli under the platform, and the numbers of dead scattered over the gravel-walks, or swept into heaps off the lawn. There was proof enough that there had been a furious war and

* Bushey Heath, Herts.

immense loss of life. And the other visible signs were no less remarkable. The two outside hives were in full activity—a ceaseless current of departing and returning bees—whilst the centre was obviously deserted, and its desolate entrance, only a few inches distant from each of the other two, violated by an exploring wasp, or single occasional bee, which also just walked in as if to reconnoitre, and came immediately out again. In one instance, I noticed the spy returned, pushing a dead body before it.

Seeing that neither the origin nor the final issue of this mortal struggle could be ascertained, a curiosity for farther investigation was excited; and all remaining so long in the same condition I have described (on the 25th), it was resolved to examine the ruined hive, and discover what were the consequences of the sack, or desertion, or holocaust in which it had been sacrificed.

Accordingly, at the end of a fortnight, the middle hive was detached and examined (September 13th), previously to which all that could be seen was a comb occupying the whole transverse space at the box at the back window, and which was a perfectly clean cellular structure of wax, with a single bee, as it were, accidentally deposited, but nothing bearing any relation to the siege and battle except the absolute stillness which had followed the catastrophe. I am minute, because in my ignorance of apiarism I am not aware whether small incidents may be quite trifling or of a certain value.

On the floor, if we may call it so, six or eight dead bees were lying. There were nine complete walls of comb, in their usual admirable order, as built under properly selected architects, surveyors, superintendents, foremen, and police, by skilled working-bees, regularly paid in honey! Of these nine walls, all (except that next the window as I have described) were in ruinous plight—dirty brown mahogany colour, and clogged with morsels of bee-bread (perhaps a few clean pieces of comb about the skirts); the cells were empty, desolate! Forsaken or plundered? A more determinate clearance never was seen. What had become of all that the cells contained? Whither had gone the large honey provision (usually completed in September) for the winter? Who carried it away? When was it carried away (it must have been within a few hours or it would have been observed after the fray)? and where was it taken or consumed?

One of the specimens of comb has been kindly sent to me. Several queen bee cells are visible on one of its outer edges, and I may remark that among the slain bees the elongate remains of at least one of the queens have been distinguished. There is a perceptible odour resembling tobacco in the débris, which, if not attributable to the rotting wax or some other chemical cause, is unaccountable. The presence of such an ingredient might suggest an unpleasant origin to the phenomenon; but surrounding circumstances are all against the suspicion; and the supposition of any artificial introduction of "the weed," in any form, could not in the slightest degree account for the results of a determined battle of eight-and-forty hours, the spoliation of the hive, and the unanswered question, What has become of the survivors? But, in fact, the exactly similar condition of another hive in an adjoining garden settles the question, and leaves the inquiry, What became of the bees?

Before endeavouring farther to elucidate the problem, however, it may be very important to state that the multitude of the insects killed were smaller, say about two-thirds the size of those in the hive; as is still manifest from the appearance of the two yet living hives, which have no sign of having been disturbed, interfered with, or in any way affected by the desperate strife waged so

close to, and indeed just between, their respective domiciles. What then has become of the fugitive or the victorious legions? The former could not have been exterminated; the latter could not (could they?) have been absorbed by their neighbours. And had either swarmed (as it were) and settled in any near locality, there is hardly a doubt that they would have been heard of and traced.

Angry bees, much more numerous than usual, infested the neighbourhood for some time, and threatened, if they did not sting, people walking about. About a fortnight after the battle, a similar hive, as I have mentioned, in an adjacent garden, was found deserted and emptied of its stores, but no previous fight was noticed; and the only semblance of a cast, anywhere, was observed in another garden, where a considerable cluster took possession of the cornice of the villa porch, and were so troublesome that the inmates were obliged to shut doors and windows to protect themselves from nearer annoyance. This body took its flight about six o'clock in the evening, and of all I have described nothing more has ever been heard or seen.

The matter seemed altogether so curious that we thought it worth while to seek information at the British Museum, but their science could not here help us. Our next application was to well-known practical apiarists who had made a study of this interesting branch of natural history, and readily and courteously gave us the results of their experience. From all we could learn it would appear that a perfect knowledge of all the wonderful economy of the hive has not yet been acquired. The works published on the honey bee are elaborated to the utmost of actual observation; yet still there are points, the conditions and nature of which have not been ascertained. Into these points, however, it is not for a paper like this to enter; and they are only alluded to in order to show why we could not get a certain explanation of the *status quo ante bellum*, the war itself, and its inexplicable sequel. As we are told, it frequently happens when the honey gathering season closes (about the beginning of September), that bees will pillage other and weaker hives—our middle box might be in this condition, and who could answer for the pacific dispositions of even its next-door neighbours? But the invaders are, it is stated by one of our informants, invariably young bees just developed,* with all their passion for honey gathering at its height, when the honey-giving flowers to gratify it gradually fail; and this in the present case would account for their not being so large as their brethren.

The question we would here put also is, Do queens lead such forays? as no instance is known of a swarm of bees taking possession of a hive already tenanted; although it is a common thing in bee management to put a swarm into a hive already furnished with comb.

In the early part of November the middle hive was recolonised: the weather was then very mild, and the bees being fed with sugar (which they greedily devour), again constructed their combs, and filled them rapidly with honey.

W. J.

* Having broached the subject, I may take the opportunity to notice two matters connected with it, and I presume not generally known. Among the many species, or rather varieties of bees in England, there is only one, the honey bee, thoroughly domesticated. Within the last three or four years, however, a beautiful bee has been introduced from Italy, called the Ligurian or mountain bee, and hived like our native brown honey bee. It is, I am informed, of smaller size, not so pugnacious, a better honey gatherer (having a larger tongue), and a marked and handsome appearance, having the abdomen richly banded with yellow stripes. I shall only add that instead of "the perfect octagon," so commonly spoken of as a marvellous example of compactness and adaptation of capacity, Mr. Willich, the accomplished geometrician, long since demonstrated the cell to be truly a construction of seven oblique rhomboids, and, in fact, an elongated dodecahedron.

Varieties.

NEWSPAPERS OF THE WORLD.—M. Eugène Hatin, who may be regarded as the historian and statistician of French journalism, aided by the collection of newspapers in the Paris Exhibition, and other sources of information, has arrived at the following results respecting the number and circulation of newspapers in the world. In round numbers, he states that there are 7,000 published in Europe; 5,000 in America; and 500 in Asia, Australia, etc. Of the above, 3,000 are issued daily, and, assuming the average sale of each paper to be 2,000 copies, there are twelve million copies of newspapers printed daily. We apprehend, however, that M. Hatin's estimate of the daily sale of each paper is too high.—*Athenæum*.

THE NOVEMBER METEORS.—Commodore Sands, of the Naval Observatory at Washington, describes the display of meteors on the morning of November 14 as the most brilliant that has been witnessed in America since the great shower of 1833. Very few were seen till one o'clock; after that time they increased in number till 4.25, which was the maximum point, as regards the number counted in a given period. One thousand meteors were counted in twenty-one minutes. Many of these were remarkable for their brilliancy and for having a bright greenish train, which usually vanished in a few seconds, but in some instances lasted several minutes. At New York the spectacle was very grand, according to Professor Thatcher. The meteors were of various colours—red, crimson, yellow, and green. Thirty were counted from 4.45 to 5 a.m., all of the first magnitude.

ABYSSINIA DESCRIBED BY GIBBON.—In the "History of the Decline and Fall of the Roman Empire," Gibbon gives a striking account of Abyssinia and its people, and especially of the results of their alliance with the Emperor Justinian (ch. xlii). In a subsequent chapter (xlvii) he gives an outline of the history of the Abyssinian Church, from which we extract some characteristic sentences:—"Encompassed on all sides by the enemies of their religion, the Ethiopians slept near a thousand years, forgetful of the world, by whom they were forgotten. They were awakened by the Portuguese, who, turning the southern promontory of Africa, appeared in India and the Red Sea, as if they had descended through the air from a distant planet. . . . In their lonely situation the Ethiopians had almost relapsed into savage life. Their vessels, which had traded to Ceylon, scarcely presumed to navigate the rivers of Africa; the ruins of Axum were deserted, the nation was scattered in villages, and the Emperor, a pompous name, was content, both in peace and war, with the removable residence of a camp. Conscious of their own indigence, the Abyssinians had formed the rational project of importing the arts and ingenuity of Europe, and their ambassadors at Rome and Lisbon were instructed to solicit a colony of smiths, carpenters, tilers, masons, printers, surgeons, and physicians, for the use of their country." After narrating the success of the Portuguese invaders and of the Jesuit proselytism for a time, Gibbon continues the history in rapid summary, down to the expulsion of the Jesuits, in 1632, "when the gates of the solitary realm were for ever shut against the arts, the science, and the fanaticism of Europe."

THE WELL OF ST. CAVAN.—A correspondent at Ahascragh, Ireland, thus describes a recent visit: "I went to-day to see a most painful sight, worthy of a heathen rather than a Christian country. There is about two miles from this a holy well, dedicated to St. Cavan, to which the people make pilgrimages, and round which they go a certain number of times for penance. The water of it is filthy; but the deluded creatures buy glasses of it from a woman who takes charge of it, to drink and to cross themselves with. Evidently they do not at all enjoy the draught, but fear to show signs of disgust. For one penance they go fifteen times round the well, making a circuit of about fifty or sixty yards—there being two tracks, one much longer than the other—all the time telling their beads or muttering prayers. At a certain point a crucifix is erected, at which, of course, they always stop and bow. The well is in a meadow, and as there had been heavy rains for the two or three previous days, the ground was about half a foot deep in mud from the constant tramping. Of course their feet were bare, and anon some of them turned up their skirts or trowsers, and went on their knees. I never saw any more degraded sight than these poor creatures wallowing like beasts. There were hundreds of them tramping round and round. At a short distance from the well about a dozen booths were erected for the sale of pro-

visions, for many of the people come very long distances and remain all day; the evening is spent in dancing and drinking. One horrible spectacle was a number of cripples and infirm people making a gain of their miseries by begging from the people; one man exposing the bare stump of an arm which had been amputated below the shoulder, and positively yelling for pity and relief. Indeed all these poor wretches who were begging made the most terrible noises, such as Irish alone can make. I have never seen a more heart-sickening sight, nor one which so well gives you to understand the demoralisation of the people here, fostered by the influence of the Popish religion."—M. M. L.

SERMON IN A PICTURE.—Once as Sir David Wilkie (Mr. Washington and myself being then his fellow-travellers in Spain) was gazing on one of Titian's masterpieces—the famous picture of the Last Supper in the refectory of the Escurial—an old monk of the order of St. Jerome came to him, and said, "I have sat daily in sight of that picture for nearly threescore years. During that time my companions have dropped off one after another; all who were my seniors, all who were of my own age, and many or most of those who were younger than myself. Nothing has been unchanged around me except those figures, large as life, in yonder painting; and I look at them till I sometimes think that they are the realities and we the shadows."—*Earl Stanhope*.

M. FOULD.—The late Minister of Finance, like his friend Véron, was an epicure, but in no way shared the doctor's aversion to truffles. All this was well known by petitioners, for it is not the first time a great man's failing has been made use of. One day a magnificent turkey, stuffed with truffles, made its appearance at the Ministry of Finance, was speedily transferred to a spit at the private residence, and served to the Minister. As the noble bird was being cut up, an enormous truffle, with a folded letter inserted in it, rolled out, to the astonishment and concealed amusement of the beholders, and the highly-scented missive was presented to M. Fould, who burst into a hearty laugh when he had made out its damaged contents. It was signed by an old officer, who long and in vain had solicited a place. Demands after demands had been delivered and committed to the waste paper basket; and at last the cunning lieutenant had had recourse to this epistolary ruse, which succeeded to perfection, for a month afterwards he was appointed to the office he had so long wished for.

SENNEN CHURCH AT THE LAND'S END.—Sennen Church, situated within half a mile of the Land's End, was last autumn re-opened, after having been restored at great cost. The old edifice was fast crumbling away, and at length became so bad that it was not considered prudent to hold divine service in it. Sennen, St. Levan, and Buryan formerly constituted a deanery, which for many decades was held by Mr. Stanhope, who was the subject of the Duke of York's brief and laconic epistle to the Bishop of Cork, more than half a century ago, and of the Bishop's equally interesting answer to his Grace:—"Dear Cork,—Ordain Stanhope. Yours, YORK."—"Dear York,—Stanhope's ordained. Yours, CORK." Dean Stanhope received annually more than £1,000 for his far-distant Cornish deanery; a curate was employed for each parish. At the dean's death the Ecclesiastical Commissioners divided the parishes into three different livings, each with a good stipend.

COURT OF PROBATE.—Among useful things not generally known is a regulation which became law some three years ago, by which wills may be proved and letters of administration obtained by "personal application," without the aid of a proctor or solicitor. The advantages of this plan were at once seen and appreciated by Mr. Tidd Pratt, the Registrar of Friendly Societies, who published directions as to its working in his annual Report to Parliament. Plain rules of a similar kind have been lately drawn up and sent to all postmasters in the United Kingdom, for the information of depositors in the Post-office Savings-banks, and those insured under the Government Insurance and Annuities Act. These "personal applications" can be made either at the Chief Office, 12, Great Knightbridge Street, Doctors' Commons, or at any one of forty district registries now established for that purpose in the provinces, if, as to the latter, the deceased person had a fixed place of abode within that particular district. A great saving may thus be effected by executors and others in the proving of wills representing only small sums, and it so furnishes an additional inducement for the investment of savings.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper*.

MARY TALBOT AT WORK FOR THE DEALERS.

THE MORTONS OF MORTON HALL.

CHAPTER X.—MARY TALBOT ANSWERS AN ADVERTISEMENT, AND LEAVES HAMMERSMITH FOR ST. DAVID, CORNWALL.

FIVE months have elapsed since the date of Mrs. Talbot's decease. The cheerless winter has passed away, and given place to spring, and spring is merging into summer. One fine morning in the early summer, Mary Talbot was seated at the open window of a snug little parlour, in a small, neat, ornamental cottage in the village of Hammersmith, which metropolitan suburb presented, at the date of my story, many more of the pleasant characteristics of a rural village than it boasts at the pre-

sent day. The cottage stood in a little garden, laid out in small shrubberies, and flower-beds, cut up into squares and circles and rhomboids, after the pattern so often seen in old-fashioned china ware. In one corner stood a small, pagoda-like summer-house, the pride of the tenant of the cottage; and everything about the place was, like the dwelling itself, in miniature, with the solitary exception of the large brass plate on the front door, on which was conspicuously engraved the name of the occupant of the residence—"MRS. MARGARET JENKINS."

The worthy *ci-devant* housekeeper at Morton Hall, who was the lady in question, held tenaciously to the

belief that an extensive door-plate bore manifest and conclusive testimony to the high gentility of the occupant of a house, and that the larger the name appeared on the plate the better.

"I ain't noways ashamed of the name of Jenkins, my dear," the worthy woman was wont to say. "It were the name in which me and my good man, as is dead and gone, worked ourselves up'ards from sarvice to independence—sarvice, as the sayin' is, bein' no inheritance—in the coal and 'tater and general chandlery line. And, though Jenkins were summary cut off in his prime, just as he was app'inted churchwarding, which I says it as perhaps shouldn't—a more respectable man, nor a finer figure—though once a butler in a first-class family—the parish did never hold. He was an example to society, dying and leaving me a widdier with a hundred and fifty pounds per annum in the funds, which is all the more reason as I should show respect by upholding the name to his memory."

My readers will recollect that it was to Mrs. Margaret's cottage in Hammersmith that Mary Talbot went after the death of her mother, the old housekeeper having urged the young lady to make the cottage her home while she looked about her, and endeavoured to procure employment as a teacher of the various accomplishments which had once been a source of amusement to her. Through the exertions and recommendation of Mrs. Jenkins—who, as the independent widow of a retired shopkeeper, was looked up to with much respect by her neighbours—the young lady had been engaged by two or three ambitious shopkeepers of the vicinity to teach French and music and drawing to their daughters, and she had likewise found occupation for her spare hours by working for the picture dealers. Thus, from the very beginning of her struggles to earn a livelihood by her own exertions, Mary Talbot had saved her portica of the little capital which had accrued to her and her brother through the sale of the furniture of Rose Cottage, and had been spared the humiliation of absolute dependence upon the bounty of the kind-hearted old housekeeper.

She had, however, soon made the discovery that there is a wide difference between the practice of accomplishments for mere amusement, or for the admiration of partial or flattering friends, and the teaching of the same accomplishments for reward; and, naturally skilful as she was, she had also discovered that an early and thorough training is as essential to ensure success to a teacher or an artist, as it is to the worker in any other profession or calling. The remuneration she was able to earn by her incessant labour was barely sufficient to enable her to maintain herself, even in the most economical manner, and to keep up, at the same time, a respectable and lady-like appearance; while the confinement to which she was subjected was almost unendurable to one who had been accustomed from childhood to ramble freely about the fields, and breathe the pure air of the country. She began to suffer alike in health and spirits, and at length resolved to seek for some more congenial occupation.

To find such occupation, however, was, to a young lady in her position, a matter of no trifling difficulty. She began, in fact, to fear that she was unfitted for any other occupation than that in which she was engaged, and had almost given up her endeavours in despair, when one morning an advertisement in the "Chronicle" caught her eye. She determined to apply for the situation that was offered, though with scarcely a hope that her application would prove successful; since she feared that, even if all other matters were satisfactory, she was much

too young to occupy the post. She wrote, however, and, to her surprise and delight, a favourable answer was returned. The advertiser did not object to her youth—indeed, he said that it was rather in her favour than otherwise—but he required satisfactory references. These she readily procured, and again the advertiser wrote, to inform her that he was perfectly satisfied, and that he wished her to complete the engagement as soon as was convenient to herself.

As yet, however, Mary Talbot had not even hinted to Mrs. Margaret that she was desirous of a change; but now she felt that it was her duty to acquaint the kind old lady—who had become greatly attached to her—that she expected shortly to leave Hammersmith, and go far away into the country, and near the sea-side.

As the young lady sat at the parlour window on that early summer morning, she appeared but little altered since the period at which she was first presented to the reader. Perhaps her face had become a trifle paler, and the expression of her countenance somewhat more anxious and thoughtful; but just now it was lighted up with joy at the idea of once again breathing the fresh, pure air of the country, and listening once more to the bleating of the sheep, the lowing of the cattle, and the blithe songs of the birds—sounds which had been sweet music to her ears since she had first learned to prattle at her mother's knee. Above all, however, she was delighted at the thought that she would behold the sea—to her, an inland country girl, a source of wonder and awe from the days of her childhood.

Still, withal, a shade of anxiety, from time to time, banished the smile from her lips, and the joyous light from her eyes, as she thought how sorry Mrs. Margaret would be to hear that she was going away, and how lonely she herself would feel at first, among total strangers, and of the onerous duties that she, a mere girl, had engaged to perform.

But youth is ever hopeful and sanguine, and Mary Talbot felt confident that, young and inexperienced though she was, she was still competent to fulfil the duties with which she would be entrusted. Her new employer—a clergyman—had written so kindly, had appeared to sympathise so feelingly with her orphaned condition, that she felt satisfied that he was a good, kind-hearted man, who would make allowances for her youth and inexperience; and Mrs. Margaret, disappointed as she might feel at first, would rejoice at any change which promised advantage to the child of her former beloved young mistress. So the shadows quickly passed away, and the young lady went on with her aerial castle-building as if they had never crossed it.

The little parlour in which she sat was furnished and arranged with unusual neatness and taste; for Mrs. Jenkins, having spent the earlier portion of her life, from the days of her girlhood, in the service of wealthy and aristocratic families, had acquired a taste in such matters superior to the generality of persons of her condition. The apartment was not overcrowded with furniture, nor were there any tawdry ornaments scattered about, nor any cheap, glaring pictures on the walls; everything, in fact, was in keeping with the size and style of the cottage itself. On a centre table, however, were several water-colour sketches in various stages towards completion, and scattered about the table were pencils, camel's-hair brushes, Indian ink, cakes of colour, and other drawing materials. Upon these Mary Talbot now cast a wearied and yet a triumphant glance.

"I have yet three sketches to finish," she murmured to herself. "They are promised for Friday, and I will

faithfully fulfil my engagement; and then farewell to drawing and painting—for a while at least. Heigh ho! I should at one time have smiled at the idea of ever being wearied and disgusted with drawing, and sketching, and music; and now I feel as though I shall never care to handle pencil or brush, or to touch a pianoforte again. But I must speak to Mrs. Margaret when she comes in. Where is the newspaper? Ah! here it is," and she took up the newspaper from the carpet where it had fallen. "Poor old lady! I know she will be sorry to lose me, and will miss me for some time after I am gone. And only to think of my going all the way to Cornwall—alone—among strangers! Why, it is as great a journey to me as it will be for poor Henry to go to America. I wish *he'd* alter his mind, poor, dear, obstinate boy! But really I wouldn't have given myself credit twelve months ago for so much courage and resolution—I'm sure I wouldn't."

She laughed a musical, girlish laugh, in the midst of which burst of merriment Mrs. Jenkins entered the parlour unperceived, and stood astonished at the unwonted gaiety of her youthful guest.

Although Mrs. Jenkins had already exceeded the threescore and ten years allotted to human life by the sacred psalmist, she was still more hale and active than many women ten years her junior. She was stout and matron-like in person, and her well-formed features were an expression of habitual benevolence and cheerfulness. Her fair forehead and ruddy cheeks, whose smoothness was unmarred by a solitary wrinkle, were set off to advantage by the soft silvery hair, which was neatly banded across her brow, and a few stray ringlets of which escaped from beneath her prim, snow-white cap. Her eyes were still bright, and her teeth still white and even; in fact, it would have been difficult to find a better preserved old lady in the whole village or suburb of Hammersmith. She almost invariably wore a plain black silk gown, with a shawl neatly folded, in old-fashioned style, across her bosom, and a necklace of small solid gold beads, which had been handed down as an heirloom from the days of her great-grandmother, who, like herself in early life, had served the Mortons of Morton Hall.

Her favourite adage, "Service is no inheritance," had certainly been negatived for several generations in her own family, although it had been verified in her own person in the end; since, as the old sexton, Matthew Budge, had told Mr. Aston, she had, at length, been summarily discharged from Morton Hall in consequence of her sympathy with the daughter of her former mistress. Altogether there was a something indescribable in the old lady's looks and manners which betrayed the fact that she was a retired upper servant, or housekeeper, and which her subsequent career as the wife of a respectable shopkeeper, and finally a widow of small independent means, had been insufficient to obliterate.

"Dear Mrs. Margaret," cried Mary Talbot, as the old lady approached towards her, "I am so glad you have come, for I have a great secret to tell you, that perhaps I ought, by right, to have told you before; though really until this morning it was still a doubtful matter."

"You've got some new or better-paying scholars, my dear, I hope," replied the old lady; "or may be them pictur-dealers is going to raise their prices, for I'm sure it's a scandal as they should pay so little as they do for picturs which, as I said to Mrs. Gibson next door, only yesterday, is a deal more nateral than natur itself."

"You have guessed wrong, Mrs. Margaret. I have got no new pupils, and I don't suppose the dealers would pay me a higher price for my daubs—I'm quite out of conceit with myself since I began to paint for

money)—if I were to work for them all the days of my life. More than that, I'm going to put aside my drawing and painting materials, perhaps for ever."

"And you draw and paint so beautiful, my dear!"

"I begin to fancy that I paint anything but well, Mrs. Margaret."

"Now can't I see with my own eyes, old as they be, my love? Don't I know how beautiful your dear ma draw'd when she were your age, and don't you do quite as well as she? Why, when I went down to Codford on a visit to your poor dear ma, just arter poor Jenkins died, didn't your ma tell me as you were cleverer than she, and had more of a nateral gift for drawin' and paintin'?"

"Ah, yes, to be sure. When dear papa was living and I used to sketch and play for my own amusement, or that of others, those who looked on, or listened, used to say, 'How charming! Really, Miss Talbot, you possess wonderful talent. You could put to shame many a professional artist;' or, 'Dear me, Miss Talbot, you play *too* well for an amateur. Your touch is so light and delicate, your time so perfect, your style so un-hackneyed. I could sit and listen to you for ever.' And I, Mrs. Margaret—I was silly and vain enough to believe all they said! Ah! adversity is a stern teacher. Now it is—'Miss Talbot, your charges are, I think, very high for a non-professional, for of course you don't place yourself on a level with a trained teacher of music;' or, 'Miss Talbot, those sketches are pretty fair for an amateur; but you need practice—you need practice, miss. You require a firmer touch—more breadth of colouring. I really couldn't think of paying more than a trifle for these, though you will improve in course of time; and you may bring me some more—at the same price, mind you—not a penny more—as yet!'"

The young lady had mimicked the different tones of the speakers, and the old housekeeper stood amazed at her young guest's unaccustomed mood, having never heard a word of complaint fall from her lips before.

"Hark'ee, my dear, to an old 'ooman," she replied, presently seating herself on a chair opposite the young lady and leisurely putting on her spectacles.

"What matter about scholars, whether you have 'em or no? What matter what them pictur-dealers says or doo's? 'Twere your own will, or I'm sure I'd never have thought of your doing such things."

"Hark'ee to an old 'ooman, who knew and loved your poor ma when she were a baby, and see her grow up to be a young lady as there were none more thought of in the county—more sin and shame to them as wronged her out of her own. But that ain't what I were going to say."

"Jenkins and me, sorely as we wished for sich, hadn't no children. It pleased Providence to prosper us wonderful arter we come together—which many a year we courted before that time—and sot up in business. Often he says to me, 'Maggie'—he allers called me Maggie—'Maggie,' says he, 'seein' that we ain't like to 'ave no babes of our own—though very proud I'd be, and well able are we to purvide for 'em—what do you say to adoptin' some nice pretty child from them as has their olive branches crowdin' round 'em and nothin' to nurter 'em with?' He were very poetical, my good man were, and he might have writ po'try if he'd had eddication. But says I, allers—'Jenkins,' says I, 'we've been blessed with prosperity beyond what we'd a right to look for. Much I should like to have the crowning blessing of being a mother; but seeing as that blessing is withheld, I should like, as we have no kith or kin of our own to provide for, to leave sich as we 'ave to the children

of my young mistress as were wronged so shameful by them as were her app'nted guardings; and Jenkins, the dear creetur, as thought the ground weren't good enow for me to tread upon, he allers gave in to my views, and were content.

"Not, my child, as I thought you and your brother were like ever to come to want, for Captain Talbot were a real gentleman, and would have made a fortun if he'd lived. But I knew as the sea were a devouring element, and so long as your dear pa went to sea I were mistrustful.

"Now, my love, though you mightn't think it, Jenkins, when he died—which a churchwarding he were just made—he left me a clear income of one hundred and fifty pounds in the funds; which I'm told might come to two hundred or two hundred and fifty per annum, if it were put out to better interest. But my income is enow for my wants, and the money's safe, and gives me no trouble; and though I wouldn't have said nothing about my intentions if you hadn't spoke, I can leave that money to whom I choose, and you and your brother is down, equal shares, in my will.

"Now, then, since I look upon you as my own daughter, for your dear ma's sake, what need for you to demean yourself to teach children as their parints is beneath you, or to paint picturs for the dealers?

"Draw, and paint, and play for your own amusement, my love, or to please old Mrs. Margaret if you choose, and stay happy at home with me, and do as you please till I'm called away, when all I have will be yours and Master Henry's."

"Dear Mrs. Margaret," exclaimed Mary, springing from her chair, and throwing her arms round the old lady's neck and kissing her cheek, "you are the only real friend that Henry and I now have in the wide world. But, though I feel deeply grateful for your kindness, I should be very wrong if I were to avail myself of it to live a life of idleness. Though I am about to leave you for a while, I shall always feel that I have a friend to whom I can return, should the situation I have accepted prove unsuitable or distasteful to me. In such case I will return unhesitatingly, as I would come back to a mother's home. But I must do my duty while I may; and, meanwhile, I will write often to you, and you must sometimes write to me, if it be but a line to let me know that you are well. Should you be ill, I will return to you immediately, under any circumstances, and nurse you as tenderly as if you were really my mother. But, dear Mrs. Margaret, you yourself will acknowledge that it would be disgraceful for a young girl in my position to lead an idle life?"

The old lady had listened to her youthful guest in silence and astonishment.

"Leave me, child!" she now exclaimed. "Leave me! You don't mean to say that you are really going to leave me? I thought, my dear, you were merely tired of your hard work with your scholars. No, no, Miss Mary; you mustn't think of going away from me."

"It is my duty, dear Mrs. Margaret," returned Mary. "I'm sure you wouldn't wish me to shrink from that? You will still be the best and dearest friend I have in the world. But I have accepted a situation. I am going to be a governess."

"A governess in a family!" exclaimed the old lady, who had a dread of any one in whom she took an interest occupying such a position, perhaps because her experience while a servant had taught her that governesses are frequently treated—at least in some families—with less kindness and consideration than are favourite domestics. "You, my dear, you, brought up as you have

been, used to every comfort and kindness at home—you, going to be a governess?"

"Not such a governess as you are thinking of, Mrs. Margaret," replied Mary, "though perhaps you may look upon the situation I have accepted as still less desirable; but I shall have more liberty, and be more the mistress of my own time; and somehow, I fancy I shall like the situation, and be content—perhaps happy. The only fear I have is that I may be thought too youthful and girlish for such employment.

"I must tell you first that I have been so accustomed to a country life that I could not feel so happy in or near London. And then, as I have said, my labours have been so ill-required, so poorly valued, that I have for a long time felt dispirited, and at last I thought I would seek for some other employment. I advertised for a long time in vain; in vain I answered numerous advertisements that I read in the newspapers. I was too young to suit one, too inexperienced to suit another. I had been brought up to no trade—to none of those occupations by the exercise of which young women in humble circumstances are enabled to earn a living. I began to fear that I was fit for nothing save the ill-required and arduous work at which I have been for some months engaged, and I was on the point of giving up in despair any hope of procuring a change of employment, when one day, about three weeks ago, I saw an advertisement in the "Chronicle," and was vain enough to think it possible that I might meet the requirements of the advertiser, who is a clergyman, in Cornwall.

"Stay—here is the newspaper. I will read the advertisement to you."

The young lady took the paper from the table on which she had placed it, and read from it as follows:—

"A clergyman of the Church of England, residing on the sea-coast in a remote part of Cornwall, wishes to secure the services of a young woman of respectable parentage, of good moral character, and of good plain education, to superintend the schools for female children which he has established in his parish.

"The young person required will be expected to look chiefly after the religious, moral, and mental culture of the older girls, who are about to leave school, and enter upon the active duties of humble life. She must therefore have been accustomed to move in a higher class of society than that from which the average of village school teachers are supplied.

"She will not be required to take upon herself the drudgery of tuition, inasmuch as there are governesses already appointed to the schools; but will have the general control of all the pupils.

"To such an one, who can produce satisfactory testimonials to her moral and religious character, as well as to her general acquirements, a salary of £75 a year will be paid, and she will be provided with comfortable apartments—or a home to herself if she prefer it—with coals and candles. She will also have the free use of a large and well-assorted library, and will have much of her time at her own disposal.

"Address (giving name and address, and likewise names and addresses of persons to whom she may refer the advertiser, together with full particulars respecting age, qualifications, etc., etc.) to Rev. A. S., Post-office, Falmouth, Cornwall, for one week from date."

"It appeared to me," continued Mary, as she laid the newspaper aside, "that the advertisement was especially inserted in my behalf. I resolved to reply to it immediately, though I feared, even if all else were satisfactory, that I should be thought too young to fill such a situa-

tion. I wrote, however, the same day; and by the same post I despatched a letter to the Reverend George Hinton, who is the rector of the parish wherein papa and mamma lived for so many years, and in which Henry and I were born. Mr. Hinton was an intimate friend of poor mamma's, and I knew he would reply favourably in my behalf in so far as he could conscientiously do so.

"He responded forthwith, inclosing a letter, in which he spoke kindly and generously, and I fear even flatteringly, of my disposition and acquirements, and my suitability to the situation; and at the same time he wrote me that he had sent a private letter to the advertiser, which he thought would serve me.

"Of course I sent his testimonials to Falmouth after my own letter; and in a few days I received a reply from Cornwall, and learnt that the advertiser was the Rev. Archibald Sinclair, rector of the parish of St. David, and learnt also that Mr. Hinton and Mr. Sinclair had been school-fellows at Harrow, and had latterly renewed their school-boy acquaintanceship.

"Mr. Sinclair wrote that he was perfectly well satisfied with Mr. Hinton's testimonials in my favour, and also with that gentleman's account of my parentage; and he added that my youth was far from being an objection—in fact, that it was in my favour—since he wished the 'instructress'—so he phrased it—to be as nearly as possible of the age of those over whom he trusted she would exercise a beneficial influence.

"In a word, he said everything that was kind, courteous, and encouraging,—even"—Mary said this with a smile—"style me a young lady; and I'm sure he's a dear, kind old gentleman, and I shall like him very much. Indeed, I like him already before I have seen him.

"Of course I replied to his letter, and he then wrote that he wished me to come to Cornwall as soon as ever I could with convenience to myself.

"I wrote to say that I could set out from London on Monday, three weeks hence; for, you see, I have some drawings to finish and my other engagements to conclude, and then I wanted one whole week's holiday with you, my best friend; and this morning I received a letter from Mr. Sinclair, which informs me that he will send a carriage to meet me at Falmouth, and convey me to St. David, which I suspect is somewhere in the wilderness, where I should never find it of my own accord. All the better; I want to be away—in the country, where I shall see nothing but pretty cottages, and fields, and woods, and the seashore, by the way—for it's near the sea that I've so often longed to live.

"Now, dear Mrs. Margaret, I've told you all. I dare say you've wondered at the sudden increase in my correspondence of late—I, who never received a letter except from Henry, and who never wrote to any one else. You mustn't be angry or vexed. Only think, seventy-five pounds a year and a home, and all besides, to be earned by my own exertions! Tell me, now; don't you think it will be a real good thing for me?"

"My love," replied the old lady, "when young people makes up their minds to a thing, it ain't easy to turn 'em from it. Neither do I know as it's allers right. There's Master Henry, with all his larnin', will go to 'Merica, when I'm sure such as he 'ud do better at home; and now you, who I love as I'd ha' loved a darter of my own, are goin' to leave the old 'ooman. Well, well, my dear, I won't say no more about it. I see you've set your heart upon it, and p'raps it's all for the best. But mind, dear, if the situation arn't all it promises, you'll be welcome back so long as I live; and when I'm gone, all I have to leave 'll be yours and Master Henry's."

From that moment, though Mrs. Jenkins would gladly have kept Mary with her, she said not a word to dispirit her, but even encouraged her when, as the day of departure drew near, the young lady herself began to despond, by assuring her again and again that, if she were disappointed in her expectations, she had a home to which she could return, and to which she would be ever welcome, since it would one day be her own.

At length, on the appointed day, Miss Talbot took an affectionate farewell of her kind old friend, she and Mrs. Margaret parting with mutual promises to correspond frequently, and the old housekeeper promising that, if her health and the growing infirmities of age permitted, she would visit her adopted daughter in Cornwall before the autumn was over.

Henry Talbot, who was still employed at the lawyer's office in London, but who had by no means given up his original purpose to emigrate to America, accompanied his sister to the coach office, and saw her fairly off.

Henry had decided to embark for America in the October following, and it was arranged between the brother and sister that Henry should visit his sister at St. David, and spend a week or two with her before he sailed.

If Mary had listened to her brother, she would, even at the last moment, have resigned the situation she had accepted. Henry thought his sister was degrading herself in accepting, as he termed it, a situation as "a village schoolmistress." It would not be long, he argued, before he should be able to send her money enough to enable her to maintain herself in perfect independence.

Mary, however, wisely preferred to exercise her own judgment, and decided that it was her duty, so long as she had health and strength, to maintain herself through her own exertions. Little did either the brother or sister dream of the important results to both that would be brought about by Mary Talbot's acceptance of this engagement in the little village of St. David.

AMONG THE LAPPS.

BY THE REV. W. BRAMLEY-MOORE, M.A.

I.

Most of us know the mystery with which our young imaginations invested the name of some distant town or mountain, when after school drudgery it became graven upon our refractory memories. It was with such fugitive associations of the past that, in company with some friends, I commenced the ascent of that mountain plateau in the interior of Norway called the Dovre-Fjeld.

The top of a fjeld often runs for many miles at almost a dead level; and, in this respect, forms a great

contrast to the rest of Norway, which is proverbially hilly. Jerkin, the station at the foot of Sneehøtten, and at the crest of the upland steppe, is an oasis for the traveller, whether sportsman, angler, naturalist, or botanist. At this place we fell in with a party from Scotland; and, after the first diffidence had been overcome, we agreed to alter our programme, and make an excursion to the Lapps. This would cost us three days' travelling, as none could be found nearer than the borders of Sweden. What romance was infused into the name "Laplander," and how many a picture over which one had paused in boyhood was again imaged in the photographs of memory!

The road from Jerkin to the Glommen was very dreary, but we were much struck with the first appearance of a mountain covered with Arctic lichen. It was a high and conical hill, without a tree or shrub of any kind; and the moss looked chill and icy, more so as its white beauty glistened in the rays of the setting sun.

On the evening of the second day, we reached the town of Røraas, remarkable for its being the highest parish in Norway—being 3,000 feet above the level of the sea, and the only one south of the Arctic circle where corn cannot be cultivated. Its large population, which exceeds 3,000, is due to the copper mines in the neighbourhood, which from their purity rank among the richest in Europe. They were discovered, in 1644, by a peasant of the district, Hans Olsen Aasen, by an accident like that which revealed the silver mines of Potosi, in Bolivia.* Aasen had gone out to shoot reindeer; and the frightened herd, in making their escape, tore up some of the moss on the side of the mountain; and the fortunate huntsman was astonished to find veins of shining copper disclosed beneath. Owing to the destruction of wood in the neighbourhood for the smelting works, the country is now very barren, and the climate has gradually increased in severity.

After the usual difficulties in arranging conditions as to guides and horses, which beset travellers who can only advance in one way, and who will not recede without the attainment of their object, we effected the compromise between English stubbornness and Norwegian cupidity, through the intervention of a tall, sandy-haired citizen, who united the traits of a canny Scotchman with those of a tall, lank Kentuckian. Our cavalcade started in the early morning, and we availed ourselves of a rough carriage road for several hours. This came to a termination about the middle of the day, when we unharnessed our horses, and, during our hour of refreshment, cast a coy fly upon the stream for some wayward trout. Our route now led us over high swampy moorlands, interspersed with patches of low birch, edging pools or bogs, with here or there a stunted or blasted fir, inspiring a chill feeling o'er this forlorn aspect of nature. We should not have been true to the weaknesses of travellers if we had not often asked how far it was to the Swedish frontier; what the probability was of our finding Lapps; whether they would have their reindeer; with other inquiries, to relieve the monotony of our march. We travelled until seven p.m., when we saw, in the distance, a lake glistening in the

waning sunshine, on the borders of which rumour had located an encampment.

Having reached a mountain *gaard* or farm on the water's edge, we behold an object which excites our curiosity. He is a quaint specimen of male humanity, under five feet in height; his head is covered with a close-fitting cap made of a reindeer skin, under which peers a disfigured sensual countenance. The deep-set eyes, converging to a point and slanting downwards, the flat snub nose, the broad ugly mouth stained with tobacco juice, stamped the characteristics of the Lappish type upon the dwarf. As regards his clothing, he was encased in reindeer skin, of which his jacket or smock, his gloves, his girdle holding his knife, his pantaloons, and his large shoes were made. The skin is worn with the hair outwards, and, from its peculiar texture, is an excellent protection against cold. Beware lest your imagination asks when those robes were last laid aside, or when the crystal wave of the lake invaded that human shrine. The dwarf soon acts up to the spirit of the verse which convulsed the ancient theatre with admiration, *Homo sum et nihil humani a me alienum puto*, by stretching out his hand to the strangers, saying, with a sly expression, "Tabak, tabak;" and his eyes sparkle when the flask is produced, and he quaffs the brandy—alas! his acme of human bliss. After a round of "schnapps," our new acquaintance readily engaged to conduct us to the settlement. We forthwith straggled into the birch brake and juniper bushes, over bogs and swamps, hollaoing out, to guide each other by our shouts. The "half-mile" (three-and-a-half English), which was a very "old" one, came, like all things else, to an end; when, from the scrub, we emerged suddenly upon two wigwams. Shouts of terror arose from the half-naked urchins who were playing about, and whom only the presence of the enemy was sufficient to rout.

The site of a Lapp tent is generally selected with much taste. It is pitched in a sheltered place, commanding an extensive view, in the neighbourhood of a birch wood, and near a river or a lake. The summer tent is not so elaborate as a winter's one, consisting of reindeer skin stretched over long conically-placed poles, with a circular opening at their converging point. In winter, the Lapp constructs a log hut, covered with birch bark and turf, also in the form of a truncated cone.

We hastened into the hut, crawling in through a very "gate of humility," to wit, an opening about three feet high, covered over with a flap of reindeer skin. Being informed, however, that the deer were about to be milked, we deferred our minute survey, and proceeded to the inclosure, where the herd had been collected by the help of the faithful dogs. There were about 250 of these beautiful deer, full of frolicsome life, and rubbing against one another with skittish playfulness. They had sleek skins, of a grayish brown colour, and many of the males had magnificent branching antlers, coated with the softest velvet. A kind of lasso was thrown over the horns of a female, and the process of milking began. A Lappish woman soon presented us with some milk in a wooden bowl for us to taste, but it was so much richer than our cream that one sip was quite sufficient. It is used as an article of daily food, either liquid or thickened with meal (forming a sort of porridge or *gröd*), or in the form of butter and cheese. The presence of the reindeer in these regions is due to one of those kindly decrees of a gracious Creator, whose resources are infinite, and "whose tender mercies are over all His works." It is an example of nature's

* The discoveries of the mines at Røraas in North Europe, and of Potosi in South America, are somewhat similar both in their circumstances and results. An Indian was out hunting, and, chasing some wild goats, suddenly came upon a precipice. To save himself from falling, he caught hold of a shrub, which, giving way, brought with its roots lumps of silver, and disclosed beneath a still further mass of the rich metal. In the course of fifty years a city with a population of 150,000 stood there, and the yield of the mines reached three thousand millions of dollars annually. Potosi, moreover, is remarkable as being the highest city in the world, being 13,300 feet above the level of the sea.

multum in parvo. What the Polar bear is to the most northerly outcast; the agave to the Mexican, the palm-tree to the Orinoco Indian—such is the reindeer to the Laplander, supplying him with almost every necessary for the support of life. Its flesh is prepared in different ways; and, when cut into slices and dried, is used instead of bread—a rare luxury to the Lapp. Its skin furnishes the necessary articles of his clothing, the bed he lies on, and the covering of his tent. The sinews are chewed with the teeth, and form thread and cord; of its horns are made spoons, drinking cups, and other useful articles; its milk is made into butter and cheese, affording marketable articles; and last, but not least, it supplies means of locomotion to its nomade master, in the reindeer sledge, or “*pulk*.” Moreover, it supports itself, living on the greenish yellow lichen called reindeer moss (*Cladonia rangiferina*) which covers those popularly misnamed “Scandinavian mountains” in great abundance. Though the moss apparently looks dry and valueless, yet it is a most important and providential gift, as the means of supporting thousands of reindeer, both tame and wild, in these barren regions. In the midst of winter, the deer will remove the snow to a depth of four or five feet with their hoofs, or with their short lower palmated horns, in order to get at this particular lichen, without which, together with bracing air and perpetual snow, they cannot thrive, nor indeed live for any considerable time. Some of the rich Lapps in Finmarken have herds of 2,000, and occasionally of 4,000 animals. It is computed that the tame reindeer in the provinces of Nordland and Finmarken belonging to the Lapps amount to 28,000. They are exposed in winter to many dangers from the wolves and other beasts of prey.

After inspecting the herd, we returned to the wigwams. On our first entrance the smoke was so dense as to make our eyes ache, and it is owing to this cause that so many of the Lapps suffer from blear eyes; for it must find egress from the circular outlet as best it can, in defiance of wind or storm. The scene round that wood fire in the centre was curious. More than thirty persons were crowded together in that outlying hut, the representatives of nations widely differing in habits and feelings. Our English party consisted of three ladies and seven gentlemen; next came our Norwegian *skyds-carls*, who looked down upon the Lapps with the hereditary contempt felt for a degraded and exotic race; and lastly our Lappish entertainers, behind whom divers children, guiltless of clothing, appeared and disappeared into miscellaneous piles of reindeer skins. Birch branches were cast on the fire, and threw a flickering glare on our various countenances. Tobacco was handed round, followed by “*schnapps*,” and all good wishes were duly given to the “*Fremde Folk*” (strange people). They then favoured us with some songs and hymns, in a strain which, like the rural minstrelsy of the north, was nasal, lugubrious, and most unmelodious. They showed us their prayer-books, and informed us that they attended the Lutheran worship whenever they had an opportunity. They were familiar with the name of our Saviour, and with the mission of redemption which He came to accomplish; and to all our remarks on this subject they gave a hearty assent. Various articles made of reindeer horn, thread made of the chewed sinews, ornaments, books, and domestic articles, were handed round and inspected.

There is considerable obscurity as to the origin of this race, as with the Gipsies or Zingarees in other parts of Europe. Some consider them to be descended from aboriginal Norwegians, others from a colony of Finns. They

have led a nomade life from the earliest times; and that which is dearer to them than wealth, civilisation, or aught else, is their liberty and vagrancy. The mountain Lapps call themselves “*Same*,” or “*Samie*,” and consider the term “*Laplander*” as a title of contempt given to them by the Norwegians. Those who have come down to the sea-coast and are more stationary, and support themselves by fishing, are called Quains, or Finns; but the term “*Finn*” really belongs to the inhabitants of Russian Finland, who have some affinity of race with the Lapps, but in many points are entirely distinct.

The Lapp is of a very hardy nature, and will go for thirty miles through swamp and over rock, quaff his milk, sleep in his wet clothes, and start again as brisk and active as at first. When overtaken by a snow-storm, he does not think it dangerous to allow himself to be “snowed up,” and after the storm is over he coolly digs himself out as if nothing particular had happened. Often does the Lapland woman become a mother in the midst of her wintry wanderings; but the child is put into a box made of hollowed wood, and covered with leather, called a “*stock*,” which she slips on her back, and after a short repose pursues her journey without any evil consequences. This rough exposure, however, makes them prematurely aged, and, like the old crones of South Italy, intensely ugly. When falling sick in old age, they are, like the African bushmen, sometimes left on the road under a tree with some provisions; and it has occasionally happened that their remains have been found gnawed by the wild beasts, who had hastened their death.

We talked of spending the night here; but a couch of birch branches and skin, well stocked with the plagues which civilisation extends, but cannot extirpate, a wooden box as hard as the nether millstone for a pillow, served to turn the romance into a very dreary penance. A few of us, however, determined to venture. Our first care was to place the iron tripod on the fire, anxious to join in the Lapps’ evening meal. It consisted of a thick porridge made of meal, milk, and salt, repulsive save to the hungry. We then turned our feet to the fire, and courted sleep under every disadvantage. The attempt on my part was hopeless, and I lay for three hours on my comfortless bedding; now raising myself up to contemplate the group of sleepers, now fretful under an icy draught, a shower of soot, or rain; now scarred with personal wounds. I realised that if the episode of a night in the Lapps’ camp was a pleasant subject of relation, it was in the reality a hard-wrung and unromantic experience.

THE MIDNIGHT SKY AT LONDON.

FEBRUARY.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

ON comparing our southern diagram for midnight in the middle of February* with that for the middle of January, it will at once be perceived that considerable changes with respect to the meridian have taken place, all the stars having bodily travelled towards the west. Beginning from the west, or right-hand side of the diagram, we find that the constellation Orion has, for the most part, passed out of its limits, though it is still visible in the heavens very near the horizon a little south of west.

* In the February maps the size of the stars is given larger than in January, both for greater clearness, and because the proportional sizes can be better preserved in printing. All the stars in the field of vision down to those of the sixth magnitude are laid down from accurate computation. There are about six hundred stars in the two maps.—E. D.

Throughout the evening hours this splendid constellation is the most conspicuous object in the heavens, passing the meridian, or highest point, about seven o'clock, and then gradually descending to the horizon, where it sets about one a.m. The reader is here once more reminded that, to obtain a sufficiently large scale, the stars near the east and west horizons are not included in the diagrams; consequently, only a small portion of Orion is inserted. Next to Orion, the great star Sirius is disappearing from view at midnight. Castor, Pollux, and Procyon, which were on the meridian in January, have now considerably advanced towards the west, while the large star Regulus, in Leo, is on the meridian. The stars Arcturus, in Boötes, and Spica, in Virgo, are just entering as brilliant objects, one red, the other white, Arcturus being distinguishable due east, and Spica in the south-east. The small constellation Corvus, low down in the south-east, is soon identified by its four moderately bright stars. No object worthy of notice is near the zenith, excepting a few stars of the third magnitude in Ursa Major, a part of which at this hour is directly overhead. The principal stars of this constellation are, however, north of the zenith, including all the seven stars in Charles's Wain.

We are now looking directly south, towards the meridian, the exact position of which we have determined by the rules given in January. We may reasonably assume, therefore, that there will be no more difficulty in ascertaining the true line of north and south. If we look upwards near the zenith, a few stars in Ursa Major will strike the eye. Two of them are comparatively near to each other. These are known as Lambda and Mu Ursæ Majoris. The others are also designated by the name of the constellation, with the prefix of a Greek letter. In future it will not be necessary to particularise these and similar stars, or those of small magnitude, unless of exceptional interest, because, were we to do so to any extent, confusion to the mind of the reader, rather than instruction, would be the result. Passing the eye down the meridian, we come to a group of stars in Leo, commonly called the Sickle, consisting of Regulus, and five other stars nearer the zenith. To the left of Regulus, towards the east, we have Denebola, or Beta Leonis. This star, with Arcturus, and Spica, form very nearly an equilateral triangle, which is an easy means for their identification. The following not very poetical lines refer to these stars:—

"From Deneb, in the lion's tail,
To Spica draw a line,
Then will these two with Arcturus
A bright triangle shine."

On the other side of the meridian, Castor and Pollux, and several bright stars in Gemini, are visible almost due west, about half-way towards the horizon. Lower down in the south-west is Canis Minor, with the brilliant star Procyon, and lower still Canis Major, with Sirius. The constellation Hydra is on the meridian, a short distance below Leo; but, excepting Alpha Hydra, a star of the second magnitude, a little to the west, it cannot boast of any stars worthy of special notice. This dearth of objects in that portion of the heavens forms a great contrast to the numerous stars in the neighbouring constellation, Leo. Immediately over Leo is Leo Minor, consisting principally of small stars, none being greater than the fourth magnitude. Sextans, between Leo and Hydra, like Leo Minor, contains nothing above the fourth magnitude. Between Hydra and Virgo, the two small constellations Crater and Corvus may be noticed by their several stars of the third magnitude. Monoceros separates Canis Major from Canis Minor. It is com-

posed generally of small stars, very few being above the fifth magnitude.

The constellations south of the zenith, which will come under special review on this occasion, will be Canis Major, but more particularly its brightest of all the fixed stars, Sirius; Canis Minor, with its principal object Procyon; and Gemini, known to all star-gazers by the two conspicuous stars Castor and Pollux. All these are west of the meridian at midnight, passing on gradually towards the horizon. Throughout the evening, however, these stars are, with those in Orion and Taurus, seen to the greatest advantage, and at that time are frequently undergoing observation for the determination of clock-error or for other purposes at most observatories.

Canis Major, the Great Dog, is in the southern hemisphere, below Orion, Sirius being reputed as one of the hounds of that noted celestial warrior. Besides Sirius, it contains several stars of the second and third magnitude, most of which are clearly visible below Sirius, near the horizon. From the brilliancy of this fine object, which is situated in the mouth of the Dog, it is scarcely possible not to identify it from the other stars almost at a glance. By reference to other large stars, there are several ways by which it can be pointed out. For example, a line drawn from the Pleiades through the three stars forming Orion's belt leads directly to it; and, as we have already mentioned, it forms with Betelgeuse and Procyon a fair equilateral triangle. It is a perfectly white star, though it has been asserted that some centuries ago it had a reddish appearance. In the time of Ptolemy, who flourished in the reigns of the Roman Emperors Adrian and Antoninus, Sirius was recorded of a red colour. That prince of ancient astronomers, in his celebrated catalogue of the fixed stars, has put down the following stars as being of a fiery red colour: Arcturus, Antares, Aldebaran, Betelgeuse, Sirius, and Pollux. Of these, Arcturus and Antares have still a fiery red appearance, Aldebaran is of a rose tint, Betelgeuse and Pollux have an orange tinge, while Sirius is of a brilliant white. Alexander von Humboldt is of opinion that, taking for granted that the colour of Sirius had changed at some time from red to white, a great physical revolution must have taken place on the surface, or in the photosphere of this fixed star "before the process could have been disturbed by means of which the less refrangible rays had obtained the preponderance through the abstraction or absorption of other complementary rays, either in the photosphere of the star itself or in the moving cosmical clouds by which it is surrounded." It is to be regretted that in the interval between the time of Ptolemy and the present day no reference appears to have been made in history or poetry to this alleged remarkable change in the colour of Sirius. In the time of Tycho Brahe, however, we may reasonably infer that this star was white as at present, from the following circumstance:—In the year 1572, a celebrated temporary star suddenly appeared in Cassiopeia. During its continuance, Tycho observed it to change in colour in a short period from a dazzling white to a reddish hue, comparing it to the colour of Mars and Aldebaran. If Sirius had been red as in the days of Ptolemy it would most probably have been the star of comparison, Aldebaran being only of a reddish tint. It has, therefore, been concluded that the colour of this brilliant star is the same now as in 1572, and if any change has taken place it must have been antecedent to that date.

The brilliant appearance of Sirius among the stars must have attracted not only the attention of astronomers, but also of every person who occasionally gives a passing

THE MIDNIGHT SKY AT LONDON, LOOKING NORTH, FEBRUARY 15.

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, FEBRUARY 15.

thought upon the wonders of the universe above and around him. When this star was made to enter the field of view of Sir William Herschel's great forty-feet reflecting telescope, the glow of light before it became visible to the observer gave the appearance of the approach of sunrise; and when the star was fairly in the centre, the glare was always so great that it was scarcely possible to keep the eye directed to it without inconvenience, if not actual pain. Even in refracting telescopes with large object-glasses the image of this star is exceedingly bright, though not equal in intensity to that produced from reflection from such large polished metallic surfaces as those contained in the telescopes of Sir William Herschel or the Earl of Rosse. From the photometric observations of Sir John Herschel, the intensity of the light of Sirius has been found equal to 324 stars of the sixth magnitude.

A most remarkable series of researches has lately been made on the apparent irregular motion of Sirius in the heavens. Here it will be necessary to mention that, though the stars are termed "fixed stars," yet they are only comparatively so with respect to the planets of our solar system. For it has been found that almost every star has its own peculiar motion, small indeed as it appears to us, but still sufficiently large to be detected after many years' observations with standard meridional instruments. Now it has been discovered not very long ago, that this peculiar movement of Sirius is not regular like the rest of the stars, but that it is greater or less in different years, or in different series of years. The cause appeared inexplicable, till two astronomers undertook independently to investigate the subject by the application of the highest branches of mathematical analysis. It was soon announced that these irregular movements of Sirius could only be accounted for by supposing it to be affected by the attraction of some neighbouring body of sufficient magnitude. To detect this body, or satellite, was looked upon as a hopeless task, as it could only be situated within the bright rays of the star. However, Mr. Alvan Clark, of Boston, United States, with a powerful telescope of his own make, noticed a very small object on January 31st, 1862, while viewing Sirius under very favourable circumstances. After this, several astronomers in Europe and America have not only seen this small star, but have also succeeded in measuring its distance and angle of position; so that on comparing the observations made at different times with the theoretical results, the agreement has been found to be very close. It is therefore now believed that a planet or satellite of some kind has been discovered which is evidently a member of the Sirius system. It also shows that the same universal law of gravitation, by which the planets, etc., of our solar system are governed, is in action in the most distant regions of the universe, proving clearly that one great designer has called all these worlds into existence.

From the heliacal rising of Sirius the ancients reckoned the *dies caniculares*, or dog-days. It does not, however, require much acquaintance with astronomy to know that the commencement of this season can really have but little connection with the rising of Sirius, for in different latitudes the heliacal rising of that star varies considerably. There are other astronomical reasons which tend to show that Sirius is not guilty of the many evils attributed to his rising with the sun. As far as this country is concerned, the dog-days of the present generation can have no reference whatever to the rising of Sirius, for almanack-makers always include that usually warm period between July 3rd and August 11th, while Sirius rises heliacally on August 25th, or

thirteen days after the conclusion of the dog-days. The ancients, however, believed faithfully in the reputed unfavourable influences of Sirius on various kinds of diseases. Theon Alexandrinus, an astronomer in the olden time, left several precepts, among which was one "to find the exact time of the Dog star's rising with the sun; twenty days before which and twenty days after included the period of extreme heat, hydrophobia, and other evils."

Canis Minor is south of Gemini, west of Hydra, and north-east of Canis Major, the Milky Way passing between it and the last-mentioned constellation. It has always created great interest. In ancient times it was called the Precursor Dog, from its appearing in the morning dawn shortly before Sirius. Among the Arabians it was recognised not only as the forerunner of the Dog-star, but as the bright star of Syria, as well as the Lesser Dog. This interest of former ages evidently descended to the astrologers of later times, one of whom, Leonard Digges, has remarked, "What meteoroscooper, yea, who learned in matters astronomical, noteth not the great effects at the rising of the starre called the Litel Dogge?" Procyon, the principal star of Canis Minor, is of the first magnitude, and is situated in the centre of the body of the animal. In our illustration it is easily found, being below Castor and Pollux, towards the south-west. It is also one of the stars forming a triangle with Sirius and Betelgeuse already alluded to. Another way of pointing out Procyon is by drawing a line from the three stars in Orion's belt to Sirius, then a perpendicular raised over the latter star will pass through Procyon towards the north. This alignment has been put into rhyme thus:—

"Orion's belt from Taurus' eye
Leads down to Sirius bright;
His spreading shoulders guide you east,
'Bove Procyon's pleasing light."

The constellation Gemini, the Twins, is the third member of the zodiac, the two preceding being Aries and Taurus. It lies nearly midway between Orion and Ursa Major. The Twins are represented on most globes and celestial maps as two youths, or children, with their feet placed on the Milky Way, the idea originating at first with the ancient Greeks. The Orientals formerly adopted two kids, and the Arabians two peacocks. To the working astronomer, however, these imaginary forms go for nothing: he only sees in Gemini numerous interesting objects, including several double stars, clusters, and nebulae, with two splendid stars, Castor and Pollux. Castor is one of the most interesting double stars in the heavens. It will be remembered that the ship which conveyed St. Paul from Melita to Puteoli was named after these stars, by which it appears probable that they were esteemed by mariners in that age as propitious.

Castor, which is the more northerly of the two, consists of two white stars of nearly equal magnitude, belonging to a common system. It is what is termed a binary star. When Sir William Herschel observed it in 1778 the position angle was 302° , and when it was observed in 1821 by Sir John Herschel and Sir James South, the position of the secondary star had changed its quadrant to an angle of 267° . On examining the observations made by Dr. Bradley and other astronomers of the last century, and comparing them with those of more recent observers, the period of the orbit of Castor, or the time occupied in the revolution of one star around the other, has been found to be a little less than a thousand years. With a telescope of moderate power the duplicity of Castor can be easily seen; to the naked eye, however, it shines as one bright star. Pollux,

the brother of Castor, is a star with an orange tinge, and is between the first and second magnitudes. It has been suspected to have been variable in its lustre at different epochs: for example, Ptolemy, Tycho, and others have classified it among those of the second magnitude; some have recorded it of the third; while Dr. Bradley speaks of it as of the first. Probably these variations are only different methods of estimation. Castor and Pollux, with the other principal stars in Gemini, are very conspicuous, as they shine in a district of the heavens free from other bright objects, the greater number of the stars in the neighbouring constellations, Cancer and Lynx, not exceeding the fourth magnitude.

It is now time to devote a few words to the stars north of the zenith. Before doing so, however, we must suppose the observer has turned round with his face directed to the Pole star, which is sensibly in the same position as in January. The relative positions of the different stars and constellations have also undergone no sensible change; but, if we regard them with reference to the meridian, a comparison of the January and February diagrams will show a considerable alteration, the earth having traversed a twelfth part of her orbit in the meantime. The positions of the stars at midnight on February 15 are as follows:—Ursa Major is still on the eastern side of the meridian, to which it is gradually approaching, being nearly overhead. Perseus, Cassiopeia, Cepheus, and Draco, all of which are circumpolar, have advanced in like proportion from west to north and east; while parts of Andromeda, Cygnus, Lyra, Hercules, and Corona Borealis are visible at greater distances from the pole. A large part of Auriga has passed since January from south of the zenith to the north. Let us now look towards the west. The first objects attractive to the eye are the two brightest stars in Auriga, called Capella and Beta Aurigæ. These are about half-way between the zenith and horizon, a little north of west, Capella being the apparently lower star. Lower still, but more towards the north-west, the group of stars in Perseus; while, in the N.N.W., those forming the constellation Cassiopeia may be distinguished. Below Perseus and Cassiopeia, very near the horizon, is a part of Andromeda, and between Polaris and the horizon Cepheus is situated. The stars forming Ursa Minor can easily be found, by their similarity of arrangement to those of Ursa Major, the two terminating stars being much brighter than those intermediate. Below Ursa Minor, towards the horizon in the north-west, the bright stars in Draco are distinctly visible. It may be remarked here that, as Polaris is the nearest star of large magnitude to the pole of the equator, so Beta Draconis is the nearest to the pole of the ecliptic. Near the horizon, from north to north-west, the two bright stars Deneb, in Cygnus, and Vega, in Lyra, are visible, the latter being near the north-west horizon, directly under Draco. Passing on towards the west, several stars in Hercules, Corona Borealis, and Boötes can be seen, the last being due west. Between Boötes and the zenith, our old friend, Ursa Major, again attracts our notice. In the earlier hours of the evening, Ursa Major will be found in the north-east; and, by using this constellation as a point of reference, the positions of the others can be inferred.

Polaris is a yellowish star, about the second magnitude. It is accompanied by a faint companion, of the ninth. Several observers have made measures of their distance and angle of position at different epochs, to determine whether the two stars are physically, or only optically, connected. The evidence deduced from the observations seems to show that, though they are tele-

scopic companions, yet they are probably separated from each other by an almost infinite distance. In the northern hemisphere, Polaris is of great advantage to the astronomer and mariner, being used frequently for determining the latitude of places. Being of a good magnitude, it is visible through a telescope on the meridian twice in twenty-four hours; once above the pole, and once below the pole. As the angular elevation of the celestial pole above the north horizon is always the same as the latitude of the place of observation, the mean or average of the two measurements of meridian altitudes above and below the pole determines the latitude. The same can be found from any circumpolar star bright enough to be seen during the daytime; but, practically, Polaris is the best star for the purpose, as the small angular distance between the two positions is favourable for several reasons. This star is also observed regularly in most standard observatories for the determination of the azimuthal error of the transit-instrument, or the deviation of the telescope from the true meridian. Polaris is becoming year by year more truly the Pole star, as it will be gradually approaching the pole for the next 200 years or more. It will then begin to recede, continuing to do so for about 12,000 years, when the pole of the heavens will be somewhere in the constellation Lyra. In 12,000 years more it will be again in the same position as at present. In the interval of time between these distant epochs, Polaris will therefore cease for ages to bear the name of, or be useful in any way as, the Pole star.

The second bright star in Ursa Minor is Beta, or, as named by the Arabs, Kocab. It is of about the second magnitude, and is situated in the left shoulder of the Lesser Bear, Polaris being at the farthest end of the tail. The third star, Gamma, is of the third magnitude. The intermediate stars between Beta and Gamma at one extremity and Polaris at the other are much smaller; but on moonless nights they are quite distinct, and easily identified. Perhaps the following lines may help the observer to find the stars in Ursa Minor:—

“Kocab, one bright, and two faint stars,
Grace Lesser Ursa's side,
In oblong square; trace her bent tail,
And to the Pole you'll glide.”

In February, 1868, the planets Mars and Saturn are not in a favourable position for observation. Mars is invisible to the naked eye, rising and setting in daylight; and Saturn can only be seen as a morning star, low down in the heavens in the south-east. Venus will be a very conspicuous object among the stars in Aquarius and Pisces in the western sky soon after sunset, when it will be sure to attract the attention of everyone on account of its intense brilliancy. Venus sets at 7h. 34m. p.m. on the 1st of the month, at 8h. 18m. on the 15th, and at 9h. 1m. on the 29th. Jupiter will be near Venus during the first days of February, after which they will gradually recede from each other, Jupiter disappearing in the rays of the sun. Uranus is in the constellation Gemini, and is favourably situated for telescopic observation. The moon will be amongst the stars in Aries on the 1st of February; on the 2nd and 3rd among those in Taurus; on the 4th in the constellations Taurus and Gemini; on the 5th in Gemini; on the 6th in Cancer; from the 7th to the 9th in Leo; and from the 10th to the 13th in Virgo. During the remainder of the month the moon will pass successively through the other signs of the zodiac, and will rise daily at a later hour after midnight. On February 23rd an annular eclipse of the sun will take place, but it will be invisible in Great Britain. It begins at 11h. 17m. a.m., and ends at

5h. 25m. p.m., the line of central eclipse passing through Peru, Brazil, across the South Atlantic Ocean, to the western coast of Africa, near Sierra Leone.

Our diagrams, which illustrate the midnight sky on February 15th, will also serve for 10h. p.m. on March 15th; 8h. p.m. on April 15th; 6h. a.m. on November 15th; 4h. a.m. on December 15th; and for 2h. a.m. on January 15th.

CURIOSITIES OF ISLINGTON.

II.

HORNSEY WOOD HOUSE, a noted tea-house, was built at the entrance to a coppice of trees, called Hornsey Wood, in the footway from Hornsey to Highbury Barn. This house, being built on an eminence, afforded a delightful prospect of the neighbouring country; it had large rooms for company, and was much resorted to. Mount Pleasant was another famous spot; and hard by is Stroud Green, where, as in a secluded spot, some ninety years since parties of pleasure used to enjoy their picnics; and an Association of citizens used to make stated excursions, humorously styling themselves "The Mayor and Corporation of Stroud Green," reminding one of "The Mayor of Garratt," in Surrey. Hereabout, in a nook, about a century since, was Stapleton Hall, in front of which was this invitation to travellers: "Ye are welcome all—To Stapleton Hall." Mr. Tomlins believes this to have been built upon the site of the more ancient prebendal house of Stanestaple, where the Canons of St. Paul held four hides, now represented by their Prebendal Manor of Brownwood. The name is traceable to a Stone House and a Staple Hall; and according to Anthony à Wood, sub anno 1190, those halls that had staples to their doors (for our predecessors had only latch and catch) were written Staple Halls. And Mr. Tomlins further thinks that Stanestaple is suggestive of a Roman origin, when taken in connection with its proximity to the Roman Road called Ermine Street; which took its course over Stroud Green, where, according to Maitland, "there is a much greater appearance of a military way than in any other place in the neighbourhood of London, and much more so than the reputed Roman way, called the Devil's Lane." This name has been altered to Du Val's Lane, from its having been, traditionally, the scene of his exploits; and here is an old weather-board house, formerly moated, where this highwayman is said to have lived; but there is no circumstance to connect it with Du Val's history, and its more ancient name was "the Devil's House." Grose, the antiquary, used to observe that all ancient and uncommon structures, about which the vulgar could give no account, were by them ascribed either to the Devil or King John. An adjoining meadow is, to this day, called "the Devil's Field." The lane may have been named from the robberies committed there: almost within memory, it was so infested with highwaymen that few persons would venture to peep into it, even at midday; in 1831 it was lighted with gas.

We miss, in Upper Holloway, the "Crown," which had evidently once been a country mansion; it was taken down about 1857. The "Old Pied Bull" was partly burnt in 1866, but has been rebuilt. Higher up is the "Mother Red Cap," a modern public-house, but ancient in its site, for it occurs in "Drunken Barnaby," about 1630—

"Thence to Holloway, Mother Red Cap."

Pepys has an odd note, 24th September, 1661, of "drinking at Holloway, at the sign of a woman with a cake in one hand and a pot of ale in the other, which

did give occasion of mirth, resembling her to the maid that served us." There exists a token circulated at this ale-house: on the obverse is Elinour Rummyn, with a pot in one hand and a cake in the other; and in the play of "The Merry Milkmaid of Islington" is the character of Mother Red Cap. It seems to have been not an unusual alehouse-sign in former days.

Before we leave the tavern traits, we shall pay a visit to some curious old resorts in and about Islington Road, as St. John Street Road was formerly called. Here the "Old Red Lion" dates its existence from 1415, as is shown in the middle distance of Hogarth's print of "Evening." Among the eminent frequenters of this house were Thomson, the poet of "The Seasons;" Dr. Johnson, and Oliver Goldsmith. In a room here Thomas Paine wrote his infamous book, "The Rights of Man," which Burke and Bishop Watson demolished. The tavern has been almost rebuilt; opposite the "Red Lion" was "Goree Farm," let in suites of rooms; here lodged Cawse, the painter; and the mother and sister of Charles and Thomas Dibdin. The "Clown" sign, facing the gates leading to Sadler's Wells Theatre, was named in compliment to Old Grimaldi, who frequented the house. In his day it was known as the "King of Prussia," prior to which its sign had been the "Queen of Hungary." To this tavern, or rather to an older one, upon the same site, Goldsmith alludes in his "Essay on the Versatility of Popular Favour." "An ale-house keeper," he says, "near Islington, who had long lived at the sign of the 'French King,' upon the commencement of the late war with France, pulled down his own sign, and put up that of the 'Queen of Hungary.' Under the influence of her red face and golden sceptre, he continued to sell ale till she was no longer the favourite of his customers; he changed her, therefore, some time ago, for the 'King of Prussia,' which may, probably, be changed in time for the next name that shall be set up for vulgar admiration." The oldest sign of this house was the "Turk's Head." At the "Rising Sun," in the Islington Road, in 1762, on Shrove Tuesday, was advertised "a fine hog *barbaqu'd*—i.e., roasted whole, with spice, and basted with Madeira wine—at the house where the ox was roasted whole on Christmas last." And, in 1732, there were sold at the "Golden Ball," near Sadler's Wells, the valuable curiosities of Monsieur Boyle, of Islington, including "a most strange living creature, bearing a near resemblance to the human shape; he can utter some few sentences, and give pertinent answers to many questions. Here is likewise an Oriental oyster-shell, measuring three feet two inches over. The other curiosity is called the Philosopher's Stone, and is about the size of a pullet's egg; the colour of it is blue, more beautiful than ultramarine. This unparalleled curiosity was clandestinely stolen out of the Great Mogul's closet: this irreparable loss had so great an effect upon him that, in a few months after, he pined himself to death." Hereabout was Stokes's Amphitheatre, a low place, though much resorted to by the nobility and gentry. It was devoted to bull and bear baiting, dog-fighting, boxing, and sword-fighting: among the disgusting sights was a bull, illuminated with fireworks, turned loose, eating farthing pies, and drinking half a gallon of October beer in less than eight minutes. Happily, these brutalities and low exhibitions have been forbidden by law, and have been succeeded by pastimes of a better order, which at once delight and raise the public mind.

At two of the more elevated positions near Islington—namely, Barnsbury and Highbury—there existed recently moated sites, supposed to be vestiges of camps,

or, at least, summer encampments of the Romans. The claim of Barnsbury rests upon no solid foundation. Highbury Castle and Hill existed as a place of defence, Mr. Tomlins considers, "as early as the residence of the Romans in this country, and that armies have encamped there is still more probable; indeed, the Saxon word *bur-row* evidently points to some earthwork thrown up and raised either for defence or for burial of soldiers slain; while the name of Danebottom, the descriptive appellation of the valley below Highbury, in writings so far back as the reign of Henry II, demonstrates that this name of Danebottom has peculiar reference to some of those encounters our Saxon ancestors had with the Danes." Nevertheless, such vestiges and remains may with equal certainty be attributed to the British, the Romans, and also to the Danes. In 1787 Highbury Hill was abrupt and steep on the north and north-west; the eminence, rounded or artificially formed, may be consistently referred to the Romans; as may the embankments and terrace-work on the north-west of Highbury House, the site of the ancient Highbury Castle. The moat was filled up in 1855; no Roman coins were discovered. The words Castle Hill or Hills, and Castle Yard, that occur in the descriptions of Highbury Grange, or Highbury Barn, seem to point traditionally to a Roman origin. Since the destruction, in 1381, of the residential manor-house, or castle, by the coadjutor of Wat Tyler, Jack Straw, who, as Stow informs us, "took in hand to rinate that house," it has borne the nick-name of "Jack Straw's Castle." Upon the site of Highbury Barn was built the noted house of entertainment of that name; and on Highbury Grange are built villas with gardens, and a brick house of the time of Charles II, called Cream Hall, about sixty years since a farm-house, but now a villa; and somewhat farther northward was Little St. John's Wood. The oak still lingers at Highbury, and on the hedgerows above Cream Hall; and thereabout are some gnarled stocks of great age. Gerard simplified in Highbury Wood, and saw-wort grew here, as well as in the wood adjoining Islington.

The present lane or road is parallel with the embankment of the New River, and terminated by the present Sluice House (the old stone sluice stood by the side of the green lanes), made in 1776, thus dispensing with the trough through which the stream was carried, called the "Boarded River," by which it entered Islington parish. But in 1776 a passage for the stream was made in a bank of earth nearly along the old track. The river, passing beneath Highbury to the east of Islington, engulfs itself under the road in a channel of three hundred yards. The stream between Bird's Buildings and the Head was covered by iron pipes in 1861.

The New River Head is a vast circular basin, inclosed by a brick wall, whence the water is conveyed by sluices into large brick cisterns, and thence by mains and riders, named according to the districts which they supply. Here is the Company's house, originally built in 1613. The board-room, over one of the cisterns, is wainscoted, and has a fine specimen of Gibbons' carving. On the ceiling are a portrait of King William III, and the arms of Sir Hugh Myddelton and Greene. The water, having reached the works at Islington, is there filtered, and delivered into a tunnel eight hundred feet long, and eight feet by six feet six inches diameter, whence it is passed by steam-engines of three hundred horse-power into the service reservoir and distributing mains. The channels at Islington, constructed by Mynne, contain two millions and a half of bricks. The east service reservoir at Pentonville, built in hydraulic lime, contains four millions of bricks, of which forty thousand were laid in one

day; the covering of this reservoir cost £21,000. The name of Sir Hugh Myddelton is honoured in Islington and Clerkenwell, and street and square still bear his name. Upon Islington Green is a Sicilian marble portrait-statue of Sir Hugh, in the costume of his period. This statue was presented by Sir Morton Peto, Bart., M.P. It is placed upon an embellished pedestal, which has two drinking-fountains. North of the New River Head, the stream was formerly let into a tank or reservoir under the stage of Sadler's Wells Theatre, originally the Sluice House, which was drawn up by machinery for "real water" scenes, the water being sufficiently deep for men to swim in. This canal has been drained dry and filled in, and large iron water-pipes placed in its bed. At the "Sir Hugh Myddelton's Head" Tavern, hard by, was formerly an old conversation picture, with twenty-eight portraits of the Sadler's Wells Club.

Islington, the "country town hard by London," as Strype termed it, has been the residence of many great and learned men from a remote period; and especially of persons of antiquarian pursuits. Sir Walter Raleigh and the distinguished occupants of Canonbury, from the peer to the poor poet, have been named. Addison came here for change of air. No. 393 of the "Spectator," signed L., has this note: "By Addison, dated, it is supposed, from Islington, where he had a residence." Bagford, the antiquary, and book and print collector, died here, 1716; Collins, the poet, whilst labouring under mental infirmity, was visited at Islington by Dr. Johnson; and Alexander Cruden, compiler of the "Concordance," died here, 1770; John Nelson wrote here "The History and Antiquities of Islington;" John Nichols, editor of the "Gentleman's Magazine," resided at Highbury; as did William Knight, F.S.A., a collector of books on angling, and missals; and William Upcott, the bibliographer and English topographer, who possessed "the most marvellous collection of autographs that was ever brought together by the unwearied research and good luck of one individual;" Charles Lamb, who had for a time lived in Chapel Street, removed to Colebrooke Cottage, on the banks of the New River—"rather elderly by this time, running (if a moderate walking pace can be so termed) close to the foot of the house." One of his friends was George Daniel, "a certain bibliographical wight, with a biblical cognomen, who rejoiced in a bundle of old black-letter ballads, in sundry tiny, dingy tomes of merrie jestes, songs, garlands, penny drolleries, and profane stage playes, and a goodly row of Shakespearian quartos." Daniel groups his old neighbours in humorous verse, entitled "The Islington Garland." He died at Canonbury Square, April, 1864, in his seventy-fifth year, leaving a collection of rarities which it took the auctioneer ten days to dispose of. He wrote two volumes of "Merrie England in the Olden Time." Among his treasures was a collection of black-letter broadside ballads, printed between 1559 and 1597, which brought 750 guineas; his first folio Shakespeare, 682 guineas; quarto plays, £300 each and upwards; two missals of high class, etc. Quick, whom George III used to call his actor, lived in a small cottage in Hornsey Row. The passage and staircase were covered with Zoffany's paintings of Quick, in his capital characters. And in Cumberland Row lived Donald Davies, who had his coffin made some time previous to his decease, and placed it in one of his rooms for a corner cupboard. He is said to have returned one coffin upon the hands of the undertaker, because it did not please him as to size, on his getting into it.

The mother church of Islington is built upon the

site of a church with an embattled tower and bell turret, and presumed to be 300 years old when taken down in 1751. Rich Spencer's only daughter was christened here, from Canonbury. One of its oldest monuments was that to Thomas Gore, "parsonne of Iseldon," who died in 1499; and here was a memorial of Dame Katharine Brook, who "nourished with her milk" the Princess Mary, daughter of Henry VIII. Dame Alice Owen, foundress of the almshouses and school at the top of Goswell Road, was buried here; as was Dr. Cave, chaplain to Charles II; he became vicar of Islington at the age of twenty-five. Alice, wife of Robert Fowler, who died in 1540, lay here, with this inscription:—

'Behold and see: thus as I am so shall ye be.
When ye be dead and laid in the grave,
As ye have done so shall ye have.'

There were also some remarkably fine brasses here. After the Great Fire of London, 1666, the fields around Islington afforded an asylum to multitudes of homeless citizens; and £18 were collected in the parish church, on October 10, for the relief of distressed citizens, as recorded in the vestry minutes. Evelyn notes, "I went towards Islington and Highgate, where one might have seen 200,000 people, of all ranks and degrees, dispersed and lying by their heaps of what they could save from the fire, deploring their loss; and, though ready to perish for hunger and destitution, yet not asking one penny for relief, which to me appeared a stranger sight than any I had yet beheld."

In 1557, the rural village of Islington was the scene of this martyrdom: "In searching out," says Foxe, "the certain number of the faithful martyrs of God that suffered within the time and reign of Queen Mary, I find that, about the 17th day of September (1557), were burned at Islington, nigh unto London, these four constant professors of Christ—Ralph Allerton, James Austoe, Margery Austoe, his wife, and Richard Rolt." The four were martyred at Islington, giving up their spirits to Christ on one day, and in one furnace of trial.

After the Act of Uniformity was passed, in 1682, some of the ministers ejected from the Church of England opened schools in Islington. The Rev. Thomas Doolittle, late rector of St. Alphage, London Wall, had an academy at Islington about 1682, and prepared several young men for the ministry, among whom were the pious Dr. Henry and Dr. Edmund Calamy. The present church was built in 1754; its tower and stone spire are 164 feet high; it has a fine peal of eight bells, each inscribed with a couplet, inculcating loyalty, love, and harmony. Here is buried Earlom, the mezzotint engraver, remembered by his fine plates of Sir Joshua Reynolds's pictures; and, in a grave a few yards from the house in which he was born, lies John Nichols, F.S.A., of the "Gentleman's Magazine."

The single church long accommodated the suburban village of Islington, but in 1744 an Independent meeting-house was built in Lower Street, on the site now occupied by a larger chapel. Next, an episcopally-ordained clergyman ministered in a chapel in Church Street, which gave rise to the existing Islington Chapel. During the last forty years more than seventeen churches have been erected in the district of Islington; and dissenting chapels have multiplied in a similar proportion.

The increase in the value of land at Islington has been very remarkable. In 1859, at the ceremony of laying the foundation-stone of a new church there, the Rev. D. Wilson, the vicar, remarked that, twenty years ago, Mr. Thornhill offered him a piece of ground for nothing, provided he would build a church upon it; and, in addition, that he would give £300 in aid of building it,

because it would improve his property; now they were obliged to give £2,000 for that which, twenty years ago, they were offered £300 to accept. At that time, however, the land was in the midst of fields, now it is covered with houses, and densely populated.

Here we halt, to glance at the Caledonian Road, named from the Caledonian Asylum, and in its history showing us how metropolitan neighbourhoods grow. About thirty years ago, a statue of our fourth George, placed at the intersection of the roads, gave the spot the name of King's Cross; the statue has disappeared, as have the Fever and Small Pox Hospitals, to make room for the Great Northern Railway terminus, whose colossal arches and rich grilles are creditable to the taste of Mr. Lewis Cubitt. Adjoining is in course of erection another large terminus, for the Midland Railway.

At the above date there were two lines of road, leading from King's Cross, or Battle Bridge, northward—viz., Maiden Lane, now the York Road, and Chalk Road. The latter is now the Caledonian Road. Six-and-twenty years ago we remember its *chalk*, its hedges and palings broken down, its trodden-down turf, and its numerous small quarries; its hovels, its swings, ginger-beer and fruit stalls, and its Sabbath-breaking scenes. Then there were tile and brick makers, with an eye to the future formation of a line of communication of the north-west portion of Islington with Holloway and Highgate. The first important building here, below the heights of Barnsbury, was the Model Prison, as it was then called, its plan being proposed for the several gaols in the kingdom; but, from its partial success, the name has been changed to the Pentonville Prison, a costly experiment—each cell costing £180, and victualling and management nearly £36 a-head. The entrance gateway, with its massive portcullis, is not unpicturesque. Nearly opposite has since been built the Metropolitan Cattle Market, covering seventy-five acres. Near this was Copenhagen House, with its tennis and fives court. Towards the north, where a junction is formed with the Holloway Road, there is a view of the City Prison, whose picturesqueness in some measure masks the sad fact that here are shut out from society hundreds of offending fellow-men. In the prospect, however, the spires of churches and chapels are not wanting. Here are railway works, and lines of villas, indicative of prosperity; but our eye turns towards the road, where the scene on Saturday night is very imposing. The gaslights are blazing; the shops of grocers, butchers, bakers, greengrocers, coal-dealers, pawnbrokers, stationers, and newsmen, are thronged with customers; and out of doors are ballad-singers, beggars, costermongers whose goods are lighted with smoky lamps, and the stream of people seems never ending. The Caledonian Road is now a handsomely-appointed line, and all this change has come over the place within thirty years; and an industrious correspondent of the "Builder," who had an eye for such views of life, but has been removed by death from his sphere of usefulness, wrote: "Often, at night-time, we used to come westward from Islington; and when we think of the solitude which then reigned, and of the quiet nooks which were to be found about here, of sheep and cattle which fed in the Copenhagen Fields, it is difficult to imagine that this can be the same site, so completely changed in such a short time; that there can be employment for the long line of cabs; and that the thousands of foot passengers, the multitude of crowded omnibuses and carriages of different kinds, and other objects which meet the eye, are not the figures of a dream instead of reality."

ODE TO THE SUN.

BY SAMUEL LAYCOCK.*

HAIL, owd friend! aw'm fain to see thee:
 Wheer has t' bin so mony days?
 Lots o' times aw've looked up for thee,
 Wishin' aw could see thi face.
 Th' little childer, reawnd abeawt here,
 Say they wonder wheer tha'rt gone;
 An' they wanten me to ax thee
 T' shew thisel' as oft as t' con.

Come an' see us every mornin';
 Come, these droopin' spirits cheer;
 Peep thro' every cottage window;
 Tha'll be welcome everywheer.
 Show thisel' i' o' thi splendour;
 Throw that gloomy veil aside;
 What does t' creep to th' back o' th' cleawds for?
 Tha's no faunts nor nowt to hide.

Flashy clooas an' bits o' foinery
 Help to mend sich loike as me:
 Veils improve some women's faces,
 But, owd friend, they'll noan mend thee.
 Things deawn here 'at we co'n pratty,
 Soon begin to spoil an' fade;
 But tha still keeps up thi polish,
 Tha'rt as breet as when new made.

Tha wur theer when th' hosts o' heaven
 Sweetly sang their mornin' song;
 But tha looks as young as ever,
 Tho' tha's bin up theer so long.
 An' for ages tha's bin shinin'—
 Smilin' o' this world o' eawers;
 Blessin' everythin' tha looks on—
 Mackin' th' fruit grow, oppenin' th' fleawers.

It wur thee 'at Adam looked on,
 When i' th' garden bi hissel';
 An' tha smoled upon his labour—
 Happen helped him—whoa can tell?
 It wur thee 'at Joshua spoke to,
 On his way to th' promised land;
 When, as th' good owd Bible tells us,
 Theaw obeyed his strange command.

Tha'll ha' seen some curious antics
 Played deawn here bi th' human race;
 Some tha couldn't bear to look on,
 For tha shawmed an' hid thi face.
 Mony a toime aw see thee blushin',
 When tha'rt leavin' us at neet;
 An' no wonder, for tha's noticed
 Things we'n done 'at's noan bin reet.

After o' tha comes to own us,
 Tho' we do so mich 'at's wrong;
 Even neaw tha'rt shinin' breetly,
 Helpin' me to write this song.
 Heaw refreshin'! heaw revivin'!
 Stay as long as ever t' con;
 We shall noan feel hawve as happy,
 Hawve as leetsome when tha'rt gone.

Oh! for th' sake o' foalk 'at's poorly,
 Come an' cheer us wi' thi rays;
 We forgotten 'at we ail owt
 When we see thi dear owd face.
 Every mornin' when it's gloomy
 Lots o' foalk are seen abeawt—
 Some at th' door-steps, some at th' windows—
 Watchin' for thee peepin' eawt.

* Samuel Laycock, the writer of these verses, is a native of Stalybridge, was a member of the Mechanics' Institute there, and is now in charge of the Whitworth Institute, Fleetwood. He has published various pieces, in the Lancashire dialect, which possess merit enough to be made known beyond the district where they are already widely circulated and duly appreciated. In one of his poems he describes "Bowton Yard," a lowly neighbourhood, in a style that reminds the reader of Crabbe's village scenes. Take, for instance, one stanza:—

"At number nine th' owd cobbler lives, the owd chap 'at mends mi shoon;
 He's getting every week an' done, he'll ha' to leev us soon:
 He reads his Bible every day, an' sings just like a lark,
 He says he's practisin' for heaven—he's nearly done his wark."

Varieties.

THE CEDARS OF LEBANON.—The Rev. Mr. Tristram, F.L.S., informs me of a most interesting discovery lately made in the Lebanon—viz., of several extensive groves of cedar trees—by Mr. Jessup, an American missionary, a friend of his own, to whom he pointed out the probable localities in the interior. Of these there are five, three of great extent, east of Ain Zabalteh, in the Southern Lebanon. This grove lately contained 10,000 trees, and had been purchased by a barbarous sheikh from the more barbarous (?) Turkish Government, for the purpose of trying to extract pitch from the wood. The experiment, of course, failed, and the sheikh was ruined; but several thousand trees were destroyed in the attempt. One of the trees measured fifteen feet in diameter; and the forest is full of young trees springing up with great vigour. He also found two small groves on the eastern slope of Lebanon, overlooking the Buka'a, above El Medenk; and two other large groves, containing many thousand trees, one above El Baruk, and another near Ma'asiv, where the trees are very large and equal to any others. All are being destroyed for firewood. Still another grove has been discovered near Duma, on the western slope of Lebanon, near the one discovered by Mr. Tristram himself. This gives ten distinct localities in the Lebanon to the south of the originally discovered one, and including it. Ehrenberg had already discovered one to the north of that locality; and, thence northwards, the chain is unexplored by voyager or naturalist.—*Dr. Hooker, in the "Gardener's Chronicle."*

[Mr. Tristram's announcement of his discovery of the first of these hitherto unknown cedar forests was made in a paper in the "Sunday at Home" for December, 1864.]

CATTLE MARKET OF LA VILETTE.—Towards the close of the Exhibition was opened the cattle market of La Vilette, from which all Paris is to be supplied with meat. No more sheep and oxen are to be sold in Paris, or taken through the streets; from all points they can now get to market by railway, and close to the market stand the shambles, which are arranged on the most approved principles. On the first day of opening there were sold 3,527 oxen, 467 cows, 250 calves, 13,997 sheep, 204 pigs, in all, 18,545 beasts, worth over three million francs. In Dulaure's "History of Paris" it is stated, that at the end of last century the city only consumed 70,000 oxen, 18,000 cows, 120,000 calves, 350,000 sheep, 35,000 pigs, or 1,280,000 lbs. of meat in the year.

SHODDY.—Under the name of shoddy an enormous weight of material is now used which once was waste. Shoddy was first brought into use about 1813 at Batley, near Dewsbury. Mungo was adopted in the same district, but at a later period. Shoddy is the produce of soft woollen rags, such as old worn-out carpets, flannels, guernseys, stockings, and similar fabrics. Mungo is the produce of worn-out broad or similar cloths of fine quality, and of the shreds and clippings of cloth. The Pollution of Rivers Commission, which has been visiting Yorkshire, was informed of the origin of the word "mungo." A manufacturer gave some of the materials to his foreman, who, after trial in the shoddy machines, came back with the remark, "It winna go;" when the master exclaimed, "But it mun go." These old woollen rags are collected and imported from India, China, Egypt, Turkey, Russia, and in fact, all parts of the world where woollen garments are worn. They come to Yorkshire from districts where plague, fever, smallpox, and loathsome skin diseases extensively prevail; they are sorted by human fingers when the bales are opened before being placed in machines which tear up, separate, and cleanse the fibre for manufacture; but it does not seem that these rags are specially dangerous to the health of those who work among them. The lapse of time in collecting, sorting, and transmitting the rags, and the possible destruction of any special poison by friction or otherwise, must be taken into account. The dirt, dust, and fine particles blown out by the machines are collected and sold for manure at from 10s. to 20s. per ton. The shoddy trade is a remarkable instance of the utilisation of waste material. It forms nearly one-fifth in weight of the woollen and worsted manufacture of the West Riding. Mixed with wool, shoddy or mungo is largely used in the manufacture of cheap broadcloths, finer cloths for ladies' capes and mantles, pilots, witneys, friezes, petershams, pea-jackets, and blankets. A considerable quantity is used in the form of flocks for beds. Felted cloth is extensively manufactured with it, and used for table-covers, carpets, druggets, and horse-cloths. From seventy to eighty million pounds weight of shoddy and extracts are used in a year in the woollen trade.

THE LEISURE HOUR

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Courper.*

THE INNKEEPER WOULD LIKE TO GIVE SQUIRE FOLEY A BIT OF HIS MIND.

THE MORTONS OF MORTON HALL.

CHAPTER XI.—IN WHICH SQUIRE FOLEY IS TROUBLED IN MIND, AND MR. ASTON SEEKS FOR NEEDLES IN A BUNDLE OF HAY.

MR. ASTON—whom, so long as it is essential to the interests of my story, I shall continue to designate by his assumed name—returned to London the day after his visit to old Matthew Budge's cottage, having, however, according to promise, previously paid the old sexton a second visit, when he repeated his injunction that his return to England should be kept a profound secret.

The arrival and abrupt departure of the ambassador of some great foreign potentate, whose mission was un-

known, could not, comparatively speaking, have created more excitement among the citizens of London than did the unexpected visit and sudden departure of the unknown stranger among the inhabitants of the little village of Fordham.

It was known that the stranger had visited Morton Hall, and had been particular in his inquiries after the old family; also that he had subsequently been seen coming out of the church, and wandering about the churchyard, searching among the tombstones, and that he had twice visited "owd Matthey's cot;" but what was his object in visiting Fordham no one could conceive.

The innkeeper, however, believed he was some friend of the old squire's who had been long absent in foreign lands, and had never heard of Squire Morton's death, and with respect to his visit to Matthew Budge, it was no uncommon thing for strangers visiting at the mansions of the neighbouring gentry to call and see the old sexton, who was looked upon as the patriarch of the village.

Old Matthew himself was silent on the subject of the stranger's visit. It pleased and gratified the pride of the old man to be the possessor of a secret, which, if divulged, would astonish his neighbours, and create the utmost surprise and consternation at the Hall. Old as he was he looked forward with eager anticipation to the day when the secret should become known, and when he would be able to boast that he had known it all along.

For some days, therefore, the stranger's visit was the general topic of the gossips of the village, and then it was almost forgotten.

A couple of months passed away, and Squire Foley and his family returned to the Hall earlier than had been expected, and not so much gratified with the results of their visit to the metropolis as the old Scotch gardener had anticipated.

To tell the truth, Squire Foley, although one of the largest landed proprietors of the county, lord of the manor of Fordham, and a justice of the peace, had never yet occupied the position of his predecessors—the Mortons. The lord lieutenant of the county patronised him to some extent, simply because he could make him useful when there was any disagreeable work to be done that none of the other magistrates cared to meddle with; but his brother squires, and the two or three baronets whose parks and mansions were situated near Morton Hall (the county is famous for the great number of gentlemen's seats it contains), though generally less wealthy men than himself, barely tolerated him.

In the first place Mr. Foley had, previous to his accession to the Morton Hall estates, been a comparatively poor man, though, as he was a scion of an old and wealthy county family, this fact would have been disregarded, had he not on several occasions displayed a degree of meanness and servility incompatible with his position and his aristocratic pretensions. Even these failings, however, might have been overlooked and forgiven when he took possession of Morton Hall, had he then behaved generously and uprightly—for the possession of wealth covers a multitude of failings in the estimation of the majority of mankind. But it was not in the man's nature to be generous, or upright in his conduct.

No sooner had he taken possession of the estates of the defunct Mortons, than he dismissed the gentleman whose father and grandfather, as well as himself, had, for the greater portion of a century, occupied the position of attorneys and stewards of the property under the Mortons, and employed a new steward, who at once set to work to raise the rents of the numerous farms and cottages on the estates. This man refused to renew or extend leases on the terms by which they had been held in the same families for generations, and, acting under the squire's authority, suppressed nearly all the numerous charities established by his predecessors.

The village schools were closed, the loan and clothing funds abolished, and even the hospitalities for which the Hall had been famed in days gone by were heard of no more. In a word, all the little amenities between each other and their inferiors, which tend to bind the gentry of a county together in the bonds of friendship and good-fellowship, and which cause them to be loved and

respected by their tenants, were forsworn by the new squire.

The Mortons (setting aside their own religious feelings) had held it to be the bounden duty of all landed proprietors to show a good example to their tenantry by appearing, with all the servants that could possibly be spared, in the family pews at the parish church twice on the Sabbath-day; and, though this might sometimes have been but an outward show, the respect shown even to the observances of religion had had a beneficial influence upon themselves and upon the morals of the villagers. Squire Foley was utterly careless in this respect. His family and servants were frequently absent from the church sabbath after sabbath—he himself was rarely present.

Then Squire Foley neither hunted himself nor subscribed to the hunt, and B—shire being a hunting county, this dereliction on his part from what his brother county magnates held to be one of the duties, as well as pleasures, of a country gentleman, served still further to estrange him from his equals in rank, and to lower his dignity in the estimation of his inferiors.

Thus, although he was possessed with an eager, almost cringing, desire to be received on terms of social equality among his compeers, Squire Foley acted in such a manner as to cause them to shrink from him with feelings of scorn and contempt.

The manner, however, in which the "new Squire," as he was still termed, after a lapse of thirty years, had behaved to the orphan daughter of his respected and beloved predecessor, had set the crowning seal upon his demerits in the eyes of those whom he would gladly have made his friends; and there is little doubt, had the young lady herself, or her husband on her behalf after her marriage, made any endeavour to dispute the right of her guardians to withhold her mother's fortune from her, she would have found many friends eager and willing to support her claim with their money as well as their influence.

But Lieutenant Talbot and his wife, after making one formal demand upon Squire Foley, had made no further sign, and had disappeared from the county, and gone none of their former friends knew whither.

It has been already stated that a Morton, of Morton Hall, had represented the county in Parliament from time immemorial, and Squire Foley, on succeeding to the estates, had hoped that this honour would be continued in his own family; but his hope had been vain, and, in spite of coercion brought to bear upon his own tenants, he, and his sons, one after another as they attained to manhood, had invariably been defeated at the hustings, until at length they desisted for very shame from appearing as candidates for the suffrages of the electors of the county.

At length a change took place. The lord-lieutenant heretofore alluded to was a needy, grasping nobleman, whose chief object in life was to increase the amount of his rent-roll, diminished through the extravagance of his ancestors; and, whether in recognition of some service secretly rendered by his sycophant, or whether in return for a loan of money, I am unable to say—public opinion was divided at the time on this point—but assuredly as a reward for some service rendered, for his lordship was not generous without an object, secret influences were set at work, and, in defiance of a fierce opposition, the squire's eldest son was declared duly elected as one of the representatives of the county in the House of Commons.

Squire Foley now believed that he had gained his end, in spite of the scorn and contempt of his haughty

neighbours. As the father of a county member, supported by the representative of an ancient peerage, Mr. Foley fancied that he, in his turn, would be able to look down upon his brother squires, and retaliate upon them some portion of the scorn and contumely with which he had been treated by them, or—as he would rather had occurred—that his proud and scornful neighbours would now forget the past and treat him as their equal. Hence the journey to London a month earlier than usual, and hence the absence of the family from the Hall on the occasion of Mr. Aston's visit.

Squire Foley, in fact, had taken a house for the season in one of the fashionable squares, resolved for once, in honour of the occasion, to make a display regardless of expense.

He had great hopes of his son and heir, who really was a clever youth, and had acquitted himself very creditably at Oxford University, and was believed to be the genius of the family. They looked forward to his attaining to high honours as a statesman, and hoped that in course of time he would be offered—and certainly, in such case, would accept—the coronet which it was said had more than once been declined by members of the elder branch of the family.

Alas for their full-blown anticipations! Young Foley was unseated, on an election petition, for bribery. The exasperation of the squire may be better conceived than described, and it was increased when he found that, in spite of his ostentatious display, and his earnest endeavours to thrust himself into society, his proffered friendship was spurned in London, as it had been in the country, by those whose intimacy he wished to secure. Friends he could find in abundance; but they were not the friends he sought; and thus, in shame, rage, and disgust, he gave up the mansion he had hired in the fashionable square in London, and returned to Morton Hall, long before the season had expired, and two months earlier than he had been expected.

The tenants of the Morton Hall estates, including all the inhabitants of the village of Fordham, though not, as a rule, great readers of the newspapers, had heard some inkling of the manner in which the new member for the county had been received in Parliament, and had listened, or read, with none of the indignation usually felt by a tenantry whose landlord or family have been disgraced. They had nothing to say particularly against young Master William; but they disliked his father, and several of the village gossips averred that the prediction they had uttered long ago was coming to pass, and that "T' squire 'ud come to shâame yet, for t' way he treated poor Miss Mary."

Squire Foley and his family returned to Fordham. But there were none of the rejoicings that had taken place in olden times, when the Mortons returned to the Hall after a long absence. The yeomanry did not ride forth to escort them home through the village from the neighbouring town. There was no merry peal of the old parish church-bells; no triumphal arches of evergreens were erected; no banners floated in the air; no cheers were heard; no crowd of humbler tenants assembled in their best attire to greet them as they entered the park gates, and to send audible blessings after them, as they had often assembled in times gone by to greet their landlord on his return home after a long absence, and to be invited themselves to partake of the good cheer abundantly provided for them in the Hall. But silently and sadly, as though it had been a funeral hearse, the huge family travelling carriage rolled through the quiet village to the Hall beyond, where hired menials alone were awaiting their master's return.

Ah! well indeed might many who watched the huge vehicle, as it rolled heavily and silently by, repeat the words of old Matthew Budge, and cry—

"Ay! times be changed i' Fordham sin' t' owd family wor at th' Briers!"

Scarcely, however, had Mr. Foley returned to his country seat, ere he discovered a fresh cause for disquietude.

Of late years he had sought to acquire a sort of cheap popularity among his humbler tenants, by visiting them at their cottages, and chatting condescendingly with them over the affairs of the village; and, on the morning after his return, he walked into the village with a view to ascertain the opinion of his tenantry respecting the treatment his son had received in Parliament. In the first place, however, he called upon the landlord of the Wheatsheaf; and, to his surprise, was asked whether his honour had met the strange gentleman who had come to Fordham to see Squire Morton, who had been dead thirty years.

"A stranger come to Fordham to see Mr. Morton!" exclaimed the squire. "Strange, indeed! What was the stranger's name?"

"Aston, sir—Henry Aston. At least, that was the name on the gentleman's portmanteau." And then the landlord went on to tell how the stranger had visited the Briers, and the church and churchyard, and had returned to the inn sorely disappointed, and how he had told him (the landlord) that he had known the Mortons in his boyhood, and had been absent from England ever since, and had never heard of the death of the old squire and his sons, and how he had inquired after several people who had formerly lived in the village and neighbourhood, and had gone to see old Matthew Budge, and had called again to visit the old sexton, before he departed for London.

"What description of person was this stranger?" asked Mr. Foley, when he had heard the landlord's story.

"A tall, stout gentleman, of near sixty, I should say, sir," replied the innkeeper.

"Strange that an old friend of the Mortons should have remained so long ignorant of the death of the old gentleman and his sons," said Mr. Foley.

"He was very particular in inquiring after the old squire's daughter, Miss Mary Morton, sir," continued the innkeeper.

"What could *you* tell him of Miss Morton? What could *you* know of the young lady?" asked Mr. Foley, sharply, and almost angrily.

"I know nothing, your honour, and so I told him," replied the innkeeper, deferentially, "so he went to see old Matthey—"

"Of course *you* sent him, or he wouldn't have known anything of the old gossip. I dislike very much this practice of strangers going to visit the old fellow, as if there was anything very wonderful in an old man living to become a hundred years of age. The old man makes mischief with his absurd gossip, for he hasn't full possession of his faculties, and doesn't know what he is saying. I'd dispossess him of the cottage and send him to the poorhouse but for his great age. I very much wonder that *you* haven't better sense than to be always talking about him to strangers."

"The gentleman particularly asked, sir, whether there was any one living in Fordham who was living here forty year ago," replied the innkeeper; but the squire had turned away without even saying "Good morning," and was walking back to the village.

"Dispossess the old man!" muttered the innkeeper, as

he looked after him. "It's more than you've any right to do, *and if you did*, old Matthey needn't go to the parish. I'll speak as I like to my guests; and, if you weren't my landlord—more's the pity—I'd tell *you* a bit o' my mind. There's something wrong somewhere, I guess, or you wouldn't be always so crusty."

Squire Foley called in at several cottages in the village, and heard from all the tenants that a stranger, whom no one had seen before, had visited the Briers during his absence; and, on his way home, he looked in upon old Matthew Budge, with whom he chatted familiarly for some time, and then observed, carelessly—

"So, I hear that a stranger has visited the village during my absence in London, Matthew. Came to see the old family who used to live at the Hall, they tell me. Strange, if it be true. I hear that he called twice to see *you*?"

"He gave me two gowd guineas, yer honour," replied the old sexton.

"And asked you to tell him all you knew of the village and the old family, I dare say?"

"Ay, yer honour; he ax'd a power o' questions, surely; but I moind little now whatten folks says—oi be so owd. My mem'ry be clean gone."

"He told you his name, I presume?"

"Ay, squoire; he said his nāame wor summat."

"Aston—was that it?"

"Ay, oi think thatten wor th' nāame, squoire."

"And he asked you about the old family? About Miss Mary, particularly?"

"He moight, an' then agin he moightn't, yer honour. My mem'ry be very bad."

"Do *you* recollect any person of the name of Aston? Any person or any family that lived hereabouts, or used to visit at the Hall in former days?"

"No, squoire; oi canna say as oi ever heerd o' th' nāame afore."

Nothing further could be got from old Matthew, and Mr. Foley returned to the Hall in no very good humour.

Before he entered the house he encountered the gardener, whom he also questioned about the stranger's visit.

"I understand, Sanderson," he said, "that a stranger called at the Hall to inquire after the Mortons on the day my family and myself left for London."

"Did your honour no see him in Lunnun?" answered the gardener, with another question.

"I did not. But I asked *you* whether a stranger visited the Hall: I did not bid you to question *me*."

"Weel, your honour, gin I remember richt, a gentle did ca' at the Ha'. He just speered o' me about the auld times till I thoct he wasna' a'thegether richt in his head. But ye mun ken he'd been lang awa', and may be he had na haird o' the deeth o' th' auld squoire and his bairns."

"What sort of man was this stranger?"

"Ow, sir, just an ordinair, douce, ceevil-spoken body, weel on tae saxty year auld, I suld say."

"Hem! Did he make any remark when you told him that the estates had changed owners thirty years ago?"

"Na, your honour; nane that I mind the noo. He turned as pale as a ghaist, and seemed o'ercoom for awhile, an' when he cam' roun' he just speered a wheen questions o' myself aboot the Morton folk and then gaed awa' till the Ha', and had a crack wi' t' auld housekeeper body, whilk is just a' I ken o' the matter."

From the deaf old housekeeper Mr. Foley could obtain no more satisfactory information, and he retired to his study, and went thence to the dinner table in an unusually thoughtful mood.

Mr. William Foley was still in London; the squire's second son, George, was abroad with his regiment; and his younger children had gone back to school or college; so that his only companions at the dinner table were his wife, and his eldest and favourite daughter—a young lady of sixteen years.

The squire was somewhat of an autocrat in the bosom of his family. His wife and daughter saw that he was annoyed, but dared not to question him as to the cause of his annoyance, and even if they had questioned him he would have been unable to answer them. He knew not himself the cause of his anxiety, though he felt a presentiment of some approaching trouble to which he was unable to give shape or form.

The brief visit of the unknown stranger to Fordham seemed to him like a warning from the tomb, and recalled, unpleasantly, almost forgotten memories of the past. He said nothing, however, respecting his anxiety until the evening, when he and his wife were alone together. Then he inquired abruptly—

"Jane, have you ever known, or do you recollect, any person of the name of Aston?—Henry Aston?"

"I can remember no such name among the persons of my acquaintance, my dear," replied Mrs. Foley, who was a slight, fragile, weakly woman, fond of her ease, and very good-tempered—a woman who would very probably have been liked by her neighbours and respected and loved by the poor of the village, but for the animosity they bore to her husband.

"I have been thinking to-day," continued Mr. Foley, apparently entering upon an entirely different topic, "of that poor, misguided girl, Mary Morton, who married that sailor fellow—Talbot. I wonder what has become of them?"

Mrs. Foley sighed, though she wondered to hear her husband speak compassionately of Mary Morton, whose name, in fact, she did not remember to have heard him mention for years.

Though completely subservient to her husband, she had at the time of the marriage, and indeed ever since, felt a sincere pity for Mary, though she had not dared to show her sympathy. Had she had the courage to do so, she would have besought her husband to restore to the young lady the legacy which he had, in her opinion, unjustly and cruelly withheld from her; and now that he himself had spoken of the young lady, she replied—

"Perhaps poor Mary—perhaps both she and her husband—are dead, my dear; for it is strange that we have heard nothing of them for years. Perhaps, William, they have left children in poverty. I think, my dear, if *you* wish it, and proper inquiries were instituted, we might find out something about them. If they should be in poverty or trouble, or if she or her husband be dead, and have left children behind them, unprovided for, perhaps, if we *were* to seek them out, it might be better for ourselves, better for—our own children, William."

Of all things Squire Foley hated any allusion to the failure of his ambitious hopes, or to the unfortunate result of the late effort he had made to exalt his social position in the estimation of his brother magistrates.

"Jane," he angrily replied, "how can you talk so absurdly? Never let me hear you utter such nonsense again—never. As to Mary Talbot, I did no more than my duty. I acted, as I was bound to act, in accordance with her mother's will. As she has made her bed, so must she lie upon it. Still, if I thought she, or her children, if she have any—I fancy she had one child when last we heard of her—if I thought they were in distress, and knew where to find them, I would assist them, but purely out of pity, nothing more."

Poor Mrs. Foley was silenced, and her husband did not again allude to the subject. For some time, however, his moodiness and disquietude continued; but as weeks and months passed away, and nothing came of the stranger's mysterious visit to Fordham, he recovered his usual spirits, and matters resumed their customary course at Morton Hall.

* * * * *

When Mr. Aston quitted Fordham after his brief and unsatisfactory visit, he returned to London, and had an interview with a lawyer; and from that time he was for several months unceasing in his efforts to discover whether the daughter of the late Edward Morton, of Morton Hall, B—shire, as he invariably spoke of his sister to strangers, was still living; and probably, had he been guided by the advice of the lawyer who assisted him in his researches, his efforts would have been crowned with success. But, in his determination to preserve the secret of his return to England, the measures he took were of little avail, and would perhaps have failed, even had they become known to the objects of his search.

He objected to advertise, or rather he refused to permit the names of the persons he sought to be made public, and thus the advertisements might have been passed over, even if seen by those most interested in them.

Even the lawyer himself was ignorant of the real object of his employer, though he suspected that there was some secret involved in the search, only to be divulged in the event of the discovery of the persons sought after.

But, though every town and village in Great Britain or Ireland in which any persons of the names of Talbot or Jenkins were known to live, or to have lived, were visited, either by Mr. Aston himself or his agents, and though many Talbots and hundreds of Jenkinsons were found, strange to say the Talbots who had lived for so many years in the little secluded Wiltshire village were somehow or other overlooked.

Mr. Aston, on searching the navy lists for many years back, discovered that a Lieutenant Talbot had voluntarily resigned his commission some eighteen or twenty years before, but he could learn nothing respecting this officer's subsequent career. Those who had once been the lieutenant's shipmates, or brother officers, were either dead or scattered, and it was quite uncertain whether the lieutenant himself were living or dead.

"Advertise, my dear sir, for information respecting Lieutenant Talbot, formerly of the Royal Navy, stating the date at which he retired from the service, and offering a reward for any information respecting himself, or respecting his widow or children, if he be dead and they are still living, and take my word for it, you will soon discover something about them," said the lawyer.

But by acting upon this advice Mr. Aston would, he fancied, jeopardise his secret. The Foleys might suspect something, and discover that the true heir to the estates they held in possession was still living and in England; and, anxious as he was to discover his relatives, if they were living, he obstinately adhered to the whim he had formed, not to disclose the fact of his existence and return to England, until he considered that the proper time had arrived.

He therefore continued to pursue his secret and far more troublesome and costly search, until at length he was overtaken by illness, and compelled, at least for awhile, to desist.

He had, as I have said, suffered some internal in-

jury at the time of his shipwreck on the coast of Cornwall, of which he had been unaware until some weeks afterwards, and which, though it was not of a very serious nature, had rendered him liable to sudden prostration after any extraordinary exertion. In the eagerness of his researches he neglected several warnings, until he at length became so ill that he was obliged to take to his bed; and when, after some weeks' illness, he became convalescent, he hesitated whether to renew a search which appeared hopeless, or to return forthwith to America. He decided upon the latter course, but his medical advisers interfered and declared that he needed absolute repose of mind and body for some months. The discomforts of a sea-voyage, they said, would tend to retard his recovery, and might bring about a relapse, though the sea air itself would be beneficial to him. They therefore recommended him to take up his residence somewhere on the sea coast for the remainder of the season, and as, notwithstanding his previous decision, he was still reluctant to leave England while a hope remained of his discovering the objects of his search, he listened to his doctor's advice, and bethought him of his Cornish friends, to whom he had promised to write; but whom he had, in his busy occupation, almost forgotten.

A few days after he came to this decision, Mr. Sinclair received the following letter:—

"London, June —, 18—.

"REV. AND DEAR FRIEND,—When, more than five months ago, I quitted your hospitable roof, I promised to write to you from London. I have, however, been so busily occupied in what has hitherto proved a fruitless research, that I have neglected everything besides.

"I have just risen from a sick-bed to which I have been for some weeks confined; but though I had almost resolved to give up my search and return to my children in America, my medical advisers forbid me to undertake the voyage until I am perfectly restored to health. They recommend me, however, to take up my residence for a few months by the sea side, and I have therefore decided upon revisiting my kind friends at St. David.

"Will you permit me to tax your friendship so far as to request you to look out for a comfortable residence in or near your pleasant village?

"When I left St. David there was a pretty cottage near the rectory, untenanted. I mean the cottage in which—as I was told—a Captain King, of the Royal Navy, formerly resided. If that cottage is still unoccupied, it will suit me exactly. The rent is of no consequence. I can purchase furniture in Falmouth; and if you can recommend me three good servants—a man and two women—I fancy that I can make a snug bachelor's hall of the place. In that case, it is not impossible, if I can settle my affairs in America satisfactorily, that I may send for my boy and girl, and 'fix' myself—as my Yankee friends would say—for good in England. However, I cannot yet decide upon that question.

"Please let me know, as soon as possible, whether I can have the cottage to which I allude, or any other decent residence in or near the village. If your reply is favourable, I shall probably be at St. David at the end of another fortnight.

"I am too feeble to write more just now, so I shall keep all else that I have to say until I see you.

"With kind regards, therefore, to Miss Wardour, Doctor Pendriggen, and Mr. Sharpe, believe me, dear sir, yours very sincerely,

"HENRY ASTON.

"Rev. A. Sinclair, St. David, Cornwall."

THE TALMUD.

MANY people do not know what the Talmud is, and some may be like him of whom we are told in the "Quarterly Review," that he thought the Talmud was a Jewish rabbi. It is not a rabbi, but a book, which ancient rabbis compiled, and which modern rabbis hold in very high esteem. There is a well-known sentence in one of the Jewish books which says, "The Scripture is like water, the Mishnah like wine, and the Talmud like spiced wine;" the meaning of which is, that the Scripture is good, but that the traditions of the elders are very much better. Thus in the Synagogue, as in the Church of Rome, the fathers and tradition are honoured at the expense of the inspired writers. It is as it was when our Lord said, "In vain they do worship me, teaching for doctrines the commandments of men;" and "Ye have made the commandment of God of none effect by your tradition."

The Talmud must not be confounded with the Targums, which are a kind of version of Old Testament books, whereas the Talmud is a collection of the opinions of ancient Jewish doctors on all sorts of subjects, secular as well as sacred. The foundation of the Talmud, or traditional law of the Jews, is called the Mishnah, which consists of six parts, arranged under different headings. The first part, entitled "Seeds," commences with a chapter on prayers or blessings, and then goes on to treat of tithes and gifts, the Sabbatical year, the prohibition of mingled seeds and materials, and other matters. The second part, on feasts, treats of Sabbaths and holy days, and the ceremonies and sacrifices which belong to them. The third part, on "Women," is occupied about betrothal, marriage, divorce, vows, etc. The fourth part, on "Damages" or "Injuries," deals with sundry legal and commercial questions, idolatry, witnesses and punishments, moral maxims, etc. The fifth part, "Sacred Things," treats of sacrifices, the first-born, the temple, and various matters of ritual. The last part, on "Purifications," touches upon a host of topics connected with things clean and unclean.

It will be seen at once that the Mishnah is not for general reading, so much as a book of reference for the priests and doctors. But the Mishnah is not the whole of the Talmud. There is the Gemara, which bears some resemblance to a commentary, but is in fact a collection of sayings and opinions, including stories of the most extraordinary kind. Some of the lesser sections of the Mishnah have no Gemara or commentary, though most of them have, in one or other of the two forms in which the Talmud exists. These two forms of the Talmud are called the Jerusalem and the Babylonian, because one appeared in Palestine and the other in Babylonia.

The Mishnah was completed early in the third century after Christ, by rabbi Judah, surnamed the Holy. After the Mishnah came the Gemaras. The first, that of Jerusalem, was really compiled at Tiberias, about the close of the fourth century; and the second, or that of Babylonia, was drawn up at Syra, in Babylonia, a few years later, though not completed till the end of the fifth century. It is not possible to say what alterations have been made in these writings since then, under Christian influence or otherwise, but they do not now exist in complete form. And no wonder; for few books have been persecuted more than the Talmud, as no people have been more persecuted than the Jews.

The learned writer in the "Quarterly Review," (Oct. 1867), to whose article we have already alluded, says of the Talmud: "Ever since it existed—almost before it existed in a palpable shape—it has been treated much

like a human being. It has been proscribed, and imprisoned, and burnt, a hundred times over. From Justinian, who, as early as 553 A.D., honoured it by a special interdictory Novella, down to Clement VIII and later—a space of over a thousand years—both the secular and the spiritual powers, kings and emperors, popes and anti-popes, vied with each other in hurling anathemas and bulls, and edicts of wholesale confiscation and conflagration against this luckless book. Thus, within a period of less than fifty years—and these forming the latter half of the sixteenth century—it was publicly burnt no less than six different times, and that not in single copies, but wholesale, by the waggon-load. Julius III issued his proclamation against what he grotesquely calls the 'Gemarothe Thalmud,' in 1553 and 1555, Paul IV in 1559," (when it is said 2,000 copies were burnt), "Pius V in 1566, Clement VIII in 1592 and 1599. The fear of it was great indeed. Even Pius IV, in giving permission for a new edition, stipulated expressly that it should appear without the name Talmud." The mention of the popes' permitting a new edition, reminds us that although the work was printed correctly at first, the inquisitors afterwards took care to sift it, and to alter it where it seemed hostile to Christianity. They could not altogether destroy it, and so they tried to correct it. This is much to be regretted, as few even among Hebrew scholars can have access to the earliest complete edition, printed at Venice in thirteen volumes, 1520—1523.

It is really a matter of surprise that a work so large and so much persecuted should have been preserved through above a thousand years in manuscript. The Jews appear to have early copied and circulated it, so that if it was destroyed in one place, it was safe in another. And then, under the Mohammedan rule, the Jews were often favoured, and encouraged to pursue their studies. In Spain, for instance, this was the case; and the Talmud was copied, and translated and expounded there, by learned Jews during several centuries. Eminent Hebrew scholars settled in the south of France, and there also the Talmud, though persecuted by the Romish Church, was still studied. In Italy, too, the Jews found a lodgment at various points, and we have seen that Venice was the place where the whole Talmud was first printed. Whatever befel, the Bible, the Targums, and Talmud were the inseparable companions of the Jew, whether in prosperity or adversity.

The reader of the New Testament will remember the allusions to the honour in which the Jews held the opinions and even the idle fictions of their ancestors and their teachers. In fact, a body of traditions had already grown up, and was regarded with veneration. These traditions and stories went on increasing, and the love for them continued. When, therefore, they came to be embalmed in the written volumes of the Mishnah and Gemara, they were a source from which the teachers of the people derived both authority and information. With the loss of their national existence, and of an authorised government able to rule, the Talmud became of immense importance. It amplified and decided the meaning of the written law, and, claiming a sacred character, it could be appealed to in all cases of difficulty. On these and other accounts the Jews clung to it with wonderful tenacity, as they do to this day. They would listen to the "fathers," when they would scarcely heed a living teacher, without their authority to back him.

But, apart from all external considerations, there are reasons in the Talmud itself why it should be studied, not only by the Jew but by the Christian. It contains the collective thoughts of many men of different ages

and countries, upon a multitude of subjects, and scraps of information not to be found elsewhere, much of it both curious and useful. We can learn from it what the Jews of the ages before and after Christ thought of many portions of the Old Testament, and how they reasoned on philosophy, science, politics, and religion. We hear them speaking again in their peculiar style. We have their very words, as well as their ideas; and it requires but little imagination to picture the living Hillel or Gamaliel of the times of Christ. It is possible to compare their words and sayings, as well as their modes of thought, with much that we find in our New Testament; and if we do this, we shall encounter curious and startling analogies. It will be seen that in the New Testament we are in company with men of the same race and period, and that our Lord and his apostles used very much the same words and imagery as the rabbis, though they adapted them to higher and more spiritual ends. Nay, some of the better utterances of the Talmud correspond with some striking passages in the Christian Scriptures. The writer in the "Quarterly" says, "Were not the whole of our general views on the difference between Judaism and Christianity greatly confused, people would certainly not be so very much surprised at the striking parallels of dogma and parable, of allegory and proverb, exhibited by the Gospel and the Talmudical writings. The New Testament, written, as Lightfoot has it, 'among Jews, by Jews, for Jews,' cannot but speak the language of the time, both as to form, and, broadly speaking, as to contents. There are many more vital points of contact between the New Testament and the Talmud than divines yet seem fully to realize; for such terms as 'redemption,' 'baptism,' 'grace,' 'faith,' 'salvation,' 'regeneration,' 'Son of man,' 'Son of God,' 'kingdom of heaven,' were not, as we are apt to think, invented by Christianity, but were household words of Talmudical Judaism, to which Christianity gave a higher and purer meaning."

It would be certainly an error to say that Christianity invented the terms just mentioned; but it would be no less an error to say that the Talmudists invented them, or more than one or two of them, for they are nearly all to be found in the Old Testament. However, it is curious to notice the frequent mention of "baptism" as a religious ceremony, in the Talmud. But Mr. Deutsch, the writer of the article in the "Quarterly Review," goes on to mention the Talmudical condemnation of lip-service and other abuses, which we also find in the Old Testament. The most remarkable example, perhaps, quoted by him, is "that grand dictum, 'Do unto others as thou wouldst be done by,' " which, he says, was spoken by Hillel, who died ten years after the birth of Christ, "not as anything new, but as an old and well-known dictum that comprised the whole law." The law said, "Thou shalt love thy neighbour as thyself" (Lev. xix. 18); and an apocryphal book said, "Do to no man that which thou hatest;" and Hillel's words were, "Thou shalt not do to thy neighbour that which is hateful to thyself, for this is the whole law." The least we can say is that the words of Tobit come nearer to those of Hillel than the words of Christ, which are far more comprehensive and emphatic than either.

With regard to many of the resemblances between the Talmud and the New Testament, we have no difficulty; they represent modes of thought and forms of speech which were common among the pious Jews before and after the time of our Lord. There are other resemblances which infidels and sceptics have caught at, under the notion that the New Testament is indebted to the Talmud. A moment's reflection will generally set us

right, if we but remember that the Mishnah was not composed till long after the New Testament, and the Gemara at a still later period. It is more likely that the Talmudists imitated portions of the New Testament, than that the evangelists and apostles imitated the sayings and stories current among the Jews.* Whatever view we take, such similarities are incidental proofs of the genuineness of the Christian Scriptures.

The excellence of many of the moral and religious maxims of the Talmud is beyond all dispute, and they might be quoted as interesting illustrations of the manner in which the teachings of the Old Testament influenced the Jewish mind. Even heathen writings supply us with admirable precepts and sentiments; but the Hebrews were far in advance of them, as might be expected, from their writings being divinely inspired. Bearing in mind that the Jewish Scriptures were the professed foundation of sacred studies among the rabbis, we shall look in their writings for a clear statement of leading doctrines. Nor shall we be disappointed; for while, as on moral questions, there is foolish and idle speculation, there are also utterances of the truest and grandest principles. Happily, the men who rejected the Gospel of Christ, and perverted some of the more spiritual teachings of the Old Testament, retained not a few of the lessons which had been given by divine revelation. So that while the Talmud only reflects faithfully some portions of the ancient law, and distorts others, there are many things in it to which a Christian can turn with pleasure.

Of the "scientific" and "philosophical" parts of the Talmud, its grotesque legends, and its laborious trifling, this is not the place to speak. But, multifarious and heterogeneous as are its contents, it is a book which is interesting to us, and of immense importance to the Jew. As our readers will have already inferred, it throws light upon the views and habits of the Jews before and after Christ, and it may serve to illustrate some things in the New Testament. This is why it interests us; but to the Jew the Mishnah is the "Oral Law" which Moses taught, and was handed down by word of mouth from age to age until it was written. He therefore views it as of divine authority; while the Gemara is scarcely, if at all, less revered as embodying the opinions and collective wisdom of the fathers. "The Talmud," says a modern Jew, "is a complete system of all our learning, and a comprehensive rule of all the practical parts of our laws and religion."

ABRAHAM LINCOLN.

CHAPTER I.

ABRAHAM LINCOLN was the last lineal descendant of a Quaker family, who are supposed to have left England and settled in America under the auspices of William Penn. Little is known of his ancestors beyond the fact that they were a hardy race who fought with adverse circumstances in the forest and the wilderness, and trusted solely to their own energy and perseverance to conquer the difficulties that lay in their path. Thomas Lincoln, the father of Abraham Lincoln, was living in Kentucky, at a spot which was then a part of Hardin county, and distant about seven miles from Elizabeth Town, the county-seat. Our artist, who was employed to illustrate

* In our hearing, lately, when a sceptical Jew was urged with the doctrinal clearness of the Talmud on some great points, he immediately replied that the Talmud was not written till long after the Gospel was everywhere published, and that no doubt the rabbis learned very much from Christianity, which they so far imitated in self-defence. We think there is, at least, a nucleus of truth in this suggestion.

a biography published in the United States, went to see his birthplace, but found no house remaining. The spot where it stood was pointed out to him. He saw also a spring from which the farm, Rockspring, took its

ROCKSPRING,

From which the farm where Lincoln was born took its name.

name. Here, in 1809, Abraham Lincoln was born. Of his mother, whose maiden name was Nancy Hanks, few memorials remain; she had two other children—a daughter, born in 1807, who grew to womanhood and was married, but died shortly after; and a second son, born in 1811, who died in childhood; she is said to have been a woman possessing rare qualities of mind and heart.

There seemed to be but a poor chance for the education of young Lincoln. His parents were too poor to make much effort for his instruction, being engaged in the constant struggle to draw a subsistence from the soil. When they failed in one place they had to remove to another; and wherever they went they found little but hard work before them, while in those days there were no available schools at which children could be educated. Occasionally a teacher would settle in the

such wandering instructors, one of whom was a Roman Catholic; he derived little learning from both of them—the result of his studies at the age of seven being little more than the ability to read with tolerable fluency. Up to this age he had never seen even the exterior of any building set apart for religious worship, the religious services he attended being held either in some private dwelling, or log school-house, unless they took place in the open air.

In the year 1816, before the young Abraham was eight years old, his father, finding that affairs were not going on satisfactorily in Kentucky, and not relishing, it is conjectured, the increase of slavery in that state, resolved to remove to Indiana. In the autumn of that year, therefore, he packed all his goods into a waggon, in which he placed his wife and daughter, while himself

and young Abe followed on foot, driving before them their one indispensable cow, and accompanied by their constant guardian the household dog. They had to journey through woods and pathless plains for several days, in order to reach the spot where they would be able to cross the "Beautiful River"—their progress being necessarily slow, in conformity with the powers of the single draught horse who had to struggle with his

district for a time, accepting such remuneration, in money or in kind, for his services, as parents were in a condition to pay. Young Lincoln had the benefit of two

ponderous load along the untried route. There was nothing in this, however, to daunt the travellers; they were only doing as others had to do in like circum-

stances, and in all probability never dreamed of complaining. On reaching the ferry on the Ohio, they embarked their caravan in a flat-bottomed boat, and ultimately settled on the Indiana side, at a spot near where the town of Gentryville at present stands. Here

formed his share of the hard work. He learned to wield the axe and to hold the plough. He became inured to all the duties of seed-time and harvest. "On many a day during every one of those thirteen years, this Kentucky boy might have been seen with a long goad

ANDERSON CREEK FERRY, NEAR TROY, INDIANA.

they discovered a spring of wholesome water, and here accordingly they set about building the log-cabin which was to be their home during many of the coming years.

Young as he was, little Abe had to work in the building of the family home; but he was active and strong for his years, and, above all, willing at all times

in his hand driving his father's team in the field, or from the woods with a heavy draught, or on the rough path to the mill, the store, or the river landing. He was specially an adept at felling trees, and acquired a muscular strength in which he was equalled by few." As a sportsman he was less skilled. A vigorous constitution,

THE LINCOLN HOME IN ILLINOIS.

to exert himself to the utmost. Then the land had to be cleared so that grain might be sown for their common support; and in this arduous labour the boy became early inured to the realities of a pioneer's life, while he gained insensibly a spirit of self-reliance and learned to think lightly of any opposition that might be overcome. The next thirteen years of Abraham Lincoln's life were passed on this spot in working diligently under his father's eye. In 1818, when he was scarcely ten years old, his mother died, and a year or two later his father married again. As the boy grew old enough to take an active part in the labours of cultivation he manfully per-

formed his share of the hard work. He learned to wield the axe and to hold the plough. He became inured to all the duties of seed-time and harvest. "On many a day during every one of those thirteen years, this Kentucky boy might have been seen with a long goad

knowledge that he possessed, and which made him what he afterwards became, he was indebted almost solely to his own unaided exertions. As a youth he read with avidity any instructive work that he could obtain, often poring over books in the winter evenings, when candles were considered too costly a luxury, by the mere light of the blazing hearth-fire. Once, in his eagerness to acquire knowledge, young Lincoln borrowed of a neighbouring settler a copy of Weems' "Life of Washington"—the only one accessible in the district. Before he had done with it, he laid it inadvertently in the window; a rainstorm came on, and the book got so drenched as to be nearly worthless. Grieved at what had happened, the lad took the book to its owner, and, acknowledging his neglect, offered to "work out" the value of the book, not having money enough to pay for it. "Well, Abe," said the owner, "I won't be hard on you. Come over and pull fodder for me for two days, and we will call our accounts even." The offer was accepted, and thus the debt was paid. The anecdote is characteristic, and worth noting as showing the stuff that Lincoln was made of.

Leading a life that must have been half seclusion in the wilds, and reading at the same time of the deeds that make history, it was inevitable that the young man should entertain the desire to see a little more of the world. When he was about nineteen this longing was gratified by an excursion which he made to New Orleans. In order to make the journey, and see the world, he engaged himself as a "flat-boatman," and, as one of a rather rough crew, floated down the Ohio into the Mississippi, and so on to New Orleans. In the voyage he distinguished himself by his great muscular strength and his invariable good-humour.

It was about this period that Lincoln left his home at Gentryville, on one occasion with a drove of hogs to sell at the market town of Troy, on the Ohio (not an easy task—fifteen miles of bad roads, through gully, creek, and forest). After disposing of his stock, he engaged with a Mr. John Taylor to work about his farm and take charge of a ferry-boat that conveyed people or goods across the creek, at a salary of seven dollars per month and his board. He remained there nine months. Our artist had the story from Mr. Taylor's son, who is a respectable man, holding the same farm, and remembers Lincoln well.

The scenes in which Abraham Lincoln passed his youth are thus described in the "Reminiscences of the Hon. O. H. Smith." The sketch presents us with some strange social conditions worth bearing in mind in connection with the after-career of the great statesman. "The whole middle, north, and north-west portions of Indiana were an unbroken wilderness in possession of the Indians. . . . There were no public roads, no bridges over any of the streams. The traveller had literally to swim his way. No cultivated farms, no houses to shelter or feed the weary wayfarer on his jaded horse. The courts of law were held in log huts, and the juries sat under the shade of the forest trees. I was prosecuting attorney at the time of the trials at the falls of Fall Creek, where Pendleton now stands. Four of the prisoners were convicted of murder, and three of them hung for killing Indians. The court was held in a double log cabin, the grand jury sat upon a log in the woods, and the foreman signed the bills of indictment which I had prepared upon his knee: there was not a petit-juror that had shoes on—all wore moccasins, and were belted around the waist, and carried side knives used by the hunter. The products of the country consisted of peltries, the wild game killed in the forest by

the Indian hunters, the fish caught in the interior lakes, rivers, and creeks, the pawpaw, wild plum, haws, small berries gathered by the squaws in the woods. The travel was confined to the single horse and his rider, the commerce to the pack-saddle, and the navigation to the Indian canoe. Many a time have I crossed our swollen streams, by day and by night, sometimes swimming my horse, and at others paddling the rude bark canoe of the Indian."

Amidst such surroundings the young Lincoln grew up to the verge of manhood. Trained in habits of sobriety, and accustomed to regular daily labour, he was a worthy example to the working man of his class. By the time he was twenty years old he had become a Saul among his fellows, having reached the height of nearly six feet four inches; and he was as remarkable for his mental shrewdness and moral integrity as for his physical proportions and muscular power.

In the year 1830, Thomas Lincoln, attracted by the reports of the fruitful soil of Illinois, left his home in Indiana and proceeded thither, and, pushing forward to the central part of the State, made choice of a location in the Sangamon valley, about ten miles from the town of Decatur. He was, of course, accompanied by his son, and it was at this settlement that Abraham Lincoln earned for himself the title of "rail-splitter," which clung to him through life, though it does not appear that he ever worked at rail-splitting after his one signal exploit. It being necessary to enclose a piece of land for immediate cultivation, the task was allotted to young Abe, who set about it with his usual vigour, and by the aid of a single assistant accomplished it with unprecedented rapidity, plying the maul and wedge from dawn to dark, and splitting no less than three thousand rails for the purpose.

In 1831 Abraham became of age, and quitting his father, who had now a rising family by his second wife, assumed his independence, and began life on his own account. The elder Lincoln about the same time removed to Coles county in the upper waters of the Kaskaskia, where he finally settled down, and spent the remainder of his life, dying at an advanced age in 1851. While young Lincoln was casting about for any opportunity of earning a living, he fell in with a man who was beating up for a crew to help him in a flat-boat voyage down the Mississippi. Knowing that Lincoln had made such a trip before, the man was anxious to secure his services, and Lincoln, who saw nothing better before him, having no other capital than his labour, and yielding perhaps to his innate preference for exciting adventure, at once accepted the proposal made to him. When he set out to fulfil his engagement, the spring floods had so swollen the streams that the Sangamon country was a vast sea, and he had to reach the place of rendezvous in a canoe. His employer being disappointed in obtaining the boat in which the proposed voyage was to be made, there was nothing left for the party of navigators but to build one—a business which all hands set about without delay and soon brought to a successful conclusion. Then they set forth on their long trip, in the course of which young Lincoln made himself doubly welcome, distinguishing himself not only by his alacrity and personal prowess, but also by constant cheerfulness and a characteristic humour which turned the severest labour into pastime.

After a successful voyage to New Orleans, and a return by the same route, the captain of the expedition, who was about establishing himself in business in New Salem, and who had had a good opportunity of judging of the character of young Lincoln, offered him a post in

the new enterprise in which he was about to embark. The young man accepted the offer without hesitation, and at once became clerk to a store-keeper and miller—keeping a watchful eye upon both departments of the business, and performing his duties with his characteristic thoroughness. He continued in this post about twelve months, when his duties were brought to an abrupt close by the breaking out of the Black Hawk war, in which he at once resolved to bear a part.

The noted "Black Hawk," better known to American than to English readers, was an old chief of the Sac tribe of Indians, who were bound by treaty to remain on the west side of the Mississippi, leaving the land formerly owned by the tribe on the eastern side, to the undisputed possession of the whites. The old warrior, however, had thought fit to repudiate the treaty, and had re-crossed the river with his women and children, and an army of Sac warriors, together with allies from the Kicapoo and Pottawatomie nations. His intention was to take possession of his old hunting-grounds, and re-establish the ancient rights of his tribe. The Indians began operations by plundering the property of the white settlers, destroying their crops, pulling down their fences, driving off and slaughtering their cattle, and ordering the settlers themselves to leave, under penalty of being massacred. The whites, under General Gaines, marched a small force against them, and Black Hawk was driven back and compelled to sue for peace, which was accorded, and again the rights of both parties were settled by treaty. No sooner, however, was the force of the whites withdrawn and disbanded, than Black Hawk and his followers began preparations for fresh hostilities, and in the spring of 1832 again renewed their depredations. The Governor of the State now issued a call for volunteers to protect the settlers: a company was promptly raised in Menard county, in the formation of which young Lincoln was particularly active; and when an efficient force had been organised, he found himself elected to the post of captain—the first promotion he had ever received by the suffrages of his fellows. The little army set forward on its campaign towards the end of April. In the beginning of May they were reinforced by two battalions of mounted volunteers, who shortly afterwards, in a rash engagement with Black Hawk, were put to the rout and fled in panic, after losing eleven of their number. The hardships of the campaign, which for a long time led to no decisive result, sickened most of the volunteers, who, at the end of the month for which they had enlisted, had to be discharged. Lincoln, whose hardy training fitted him for a soldier's duty, cared nothing for the hardships, and he immediately enrolled himself as a private in a new and larger levy which the Governor called into the field.

There is no necessity for detailing the incidents of the war which followed, and which, like most of the border wars with Indians in America, was remarkable chiefly for the savage cruelties practised by the Red men, and the retribution for them exacted by the settlers. Towards the close of July it was brought to an end by a successful onslaught upon the Indians at the bluffs of the Wisconsin, and the subsequent battle of the Bad Axe, where Black Hawk was taken prisoner with his surviving warriors. This second campaign lasted nearly three months, during which time Lincoln performed his duty admirably, and found real enjoyment in the excitements of a soldier's life. It does not appear, however, that he at any time came personally into contact with the enemy; indeed, he himself declares the contrary in one of his congressional speeches delivered during the canvass of 1848, in which he makes a

humorous reference to his own experiences as a soldier. The speech was in answer to the covert sneers of an opponent who affected in an ironical way to compliment him as a military hero. "By the way, Mr. Speaker," said he in 1848, "did you know I am a military hero? Yes, sir, in the days of the Black Hawk war, I fought, bled, and came away . . . I did not break my sword, for I had none to break; but I bent a musket pretty badly on one occasion . . . I bent the musket by accident. If General Cass went in advance of me in picking whortleberries, I guess I surpassed him in charges upon the wild onions. If he saw any live fighting Indians, it was more than I did, but I had a good many struggles with the musquitoes; and though I never fainted from loss of blood, I can truly say I was often very hungry."

THE ROMANCE OF HERALDRY.

BY THE EDITOR OF "DEBRET'S HOUSE OF COMMONS," ETC.

I.

THE peoples of every clime in every age have evinced a desire to be recognised by some distinctive insignia. Ancient history furnishes ample evidence of the fact. Indeed, we have biblical authority for asserting that long before the advent of the Christian era it was customary for the members of each sept to acknowledge a peculiar device as the emblem of their clanship. Thus in Numbers (chap. ii. verse 1) we read, "Every man of the children of Israel shall pitch by his own *standard*, with the *ensign* of their father's house." *Æschylus*, also, in one of his tragedies, describes, with minute exactness, the designs that were borne by the chiefs who, prior to the Trojan war, besieged Thebes. The ancient Egyptians and Assyrians are known to have used symbolical figures to mark their nationality; the dragon has been the imperial ensign of China from time immemorial; the eagle is identified with the name of Rome; and even the uncultivated Indians tattoo their persons with the same symbols as did the fathers of their tribes.

Flags and banners in the earliest times formed part of the war personnel of every chieftain warrior, and in the celebrated Bayeux tapestry, executed by the consort of William the Conqueror, were displayed representations of all the Norman and Saxon military ensigns that were in use in the eleventh century. This piece of royal embroidery is the first known attempt that was made in England at heraldic illustration. In the next two centuries flags became more general, but, being made of very ample dimensions, they were displayed on a species of car, and so conveyed from place to place. In this circumstance originated the name of "car standards," which are often alluded to in history.

It was not until the period of the Crusades that any real advance was made in the art of heraldry. When, however, the soldiers of the West met in the Holy Land with numerous warriors of other nations all clad in armour, it became a matter of policy that every chief should wear some distinctive badge by which he could be recognised. Therefore each baron and knight assumed a distinct device, which, with a little variation, was borne by his followers. Crests were first placed upon the tops of basinet and helmets, then further devices were displayed upon their coats of mail and banners, which insignia were again emblazoned upon the rich surcoats worn by the knights over their armour, and also upon their shields. In this circumstance there is the origin of crests, of shields of armour, and of coats

of armour. During the Crusades the use of flags was strictly defined. In the earlier period the only ensigns used were the portraiture of such then popular personages as St. Cuthbert of Durham, St. Peter of York, and St. John of Beverley. Later, however, the banners were strictly heraldic, and each had its proper signification. The pennon was small in size, and pointed at the end. It was generally fringed with rich gold, and borne immediately below the lance-head of the knight whose personal ensign it was. The devices upon it were the armorial bearings of the owner, which were so displayed that when the weapon was fixed for charging they could be distinctly seen. When a pennon was used that had its points torn off, it indicated that the bearer had been raised on the field of battle to the dignity of a knight-banneret by the king in person. The banner was nearly square, and upon it appeared the coat of arms of the sovereign, prince, baron, or knight-banneret to whom it referred, and which was used by his own retainers and followers, and by all others who, for the time being, were under his command.

In the reign of Henry III the popularity of heraldry greatly increased, and between the years 1272 and 1500 it was treated as a science. It reached its greatest zenith, however, in the reign of Edward III, and during the civil strifes of the Plantagenets it was practically useful. In the sixteenth, seventeenth, and eighteenth centuries, heraldry declined, and the heralds of those times meet with but little consideration from those of the present day. Since the commencement of this century, and particularly during the past twenty years, there has been a growing desire to popularise the subject. And this feeling has been greatly increased by the multiplication of those so called "heraldic offices," the proprietors of which offer to find anybody's armorial bearings for a small pecuniary consideration.

Whether or not these "heralds" do their work properly is beyond our province to consider here, though we can assert that they are beginning to make the public to consider as truth the great Lord Justice Coke's remarks that "every gentleman must be *arma gerens*, and the best test of gentle blood is the bearing of arms, which are the most certain proofs and evidences of nobility and gentry." The result is that the love of display has created an additional interest in the subject. Numerous persons have in consequence "found" arms, and thousands use crests to which they have not the remotest right; also being unmindful of the circumstance that by so doing they are liable to be taxed. The cost of engraving arms is, however, so much more than the expense of crests that but comparatively few persons adopt assumptive bearings. A hint to our fair friends here may not be amiss, as we think it well they should know that ladies properly only bear their arms upon a lozenge (in the shape of a diamond), and are not permitted by the laws of heraldry to use crests.

In the present series of papers it is not our intention to give either a history of heraldry, or to describe its technicalities. Our purpose is simply to string together a variety of historical facts and traditions concerning the grants of arms, the origin of mottoes, and cognate subjects. Many of the anecdotes will be found highly entertaining, and cannot fail to show that the study of heraldry is not so dry and uninteresting as is often supposed.

There is no doubt but that in ancient heraldry all insignia were symbolic of some attribute peculiar to the assumer or grantee. Thus, if a man were physically powerful, swift of foot, patient in misfortune, or fierce in demeanour, it is presumed that he selected, as an

emblem of his prowess or peculiarity, an inferior animal, known to be distinguished for the quality desired to be represented. Success in war, or in the chase, also gave rise to a diversity of symbols which would have the requisite signification. If then the head of a family became renowned for honourable superiority, and his excellence was acknowledged by some special badge indicative thereof, it is no wonder that his descendants should wish to perpetuate the achievements of their ancestor. In modern heraldry celebrated naval and military commanders have received grants of arms which minutely set forth their services, but they are of such an elaborate nature that heralds of the old school denounce them as abnormal.

The origin of many crests and coats of arms of a singular character is involved in obscurity, and much matter of historic interest is therefore lost. Traditions of the most romantic character, however, still exist in respect to the armorial insignia of some ancient families. Among these may be mentioned the crest borne by the Fitzgerald family, of which the present Duke of Leinster is the head. It is that of a monkey standing upon its four legs, and environed round the loins with a gold chain. This is said to have had its origin in an incident that befel Thomas, the fifth Earl of Kildare, when he was an infant, A.D. 1261. His father was killed at the battle of Callan; and, on the news arriving at the family seat, all the household became panic-struck, and rushed wildly out of the house, leaving the young earl in his cradle unprotected. During the absence of the servants, a large and favourite ape, or monkey, which was kept upon the premises, stealthily entered the house, removed the child from its cot, and, while in the act of rocking it in its arms in imitation of the nurse's movements, was surprised by a domestic who had returned to watch the infant. The monkey, on finding itself detected, ran away with its precious burden, and, being hotly pursued, escaped to the abbey, the steeple of which it mounted, but still retaining possession of the young earl. The spectators were horrified, and knew not what steps to take to recover the child and to prevent his being killed. For hours they watched, and still the monkey retained his position, grinning at them and rocking the baby. They feared to frighten the animal lest it should drop its charge, and, as a last resource, retired to a distance. When they had dispersed, the monkey, finding the coast clear, descended from its perilous position, leisurely returned home, and deposited in his cradle unhurt the infant earl, who, when he grew up to man's estate, honoured Master Jackey in the manner stated.

The crest borne by the Duke of Hamilton and the Marquess of Abercorn is supposed to have had its origin in a circumstance that occurred to their mutual ancestor, Sir William de Hambleton, A.D. 1325, in which he displayed great presence of mind. The gallant knight having slain in a duel one John de Spenser, fearing that he would not meet with fair justice in England, determined, by flight, to seek safety in Scotland. He was accompanied by a servant who in several ways displayed symptoms of extreme nervousness. The fugitives were for some time hotly pursued, but at last managed to secure shelter in a wood, in which they hoped to avoid detection. While rambling here they found two woodcutters at work. After much parley, and by the offer of a considerable bribe, they induced these men to exchange clothes with them, to lend them their frame-saw, and to leave them for a time by themselves. Scarcely, however, had they donned the rustic habiliments before the emissaries of the law arrived, and interrogated them severely as to whether they had seen aught of the fugitives. They

could tell nothing, and continued their occupation of sawing. The servant, however, lost his composure, and began to display evident signs of trepidation. Sir William, observing this, sternly bade him mind his work, and energetically ordered him to cut "through." The man thus recalled to a sense of his perilous position worked with a right good will, and the officers of justice, not being able to gain any satisfactory information, retraced their steps. On his return to safety, Sir William adopted as his crest an oak tree fructed with gold acorns, and penetrated through the stem transversely by a frame-saw, the blade thereof bearing the word "Through."

The armorial bearings of the Earl of Errol, and even his family name of Hay, are said to have originated from a historical incident. In the reign of Kenneth III of Scotland, A.D. 980, the Danes invaded Perthshire and routed the Scottish troops. The retreat, however, which threatened to be of a most complete nature, was unexpectedly prevented by the intrepidity of an old yeoman and his two sons. These persons, though only armed with yokes, managed, by their bravery and expostulations, to rally the Scotch soldiers and lead them to victory. In the battle the old man was severely wounded; and, on being asked his name, could only incoherently utter the word "Hay." The monarch, as a reward to the victor, gave him substantial pecuniary gifts, and also as much of the royal domain as a falcon, which was then sitting on his hand, should fly over before it alighted. The bird flew six miles, and alighted upon an eminence that is even to the present day styled the "Falconstone." In commemoration of this circumstance, the family of Hay has for centuries past, borne in its armorial bearings, some allusion to the prowess of its rustic ancestor. There are several branches of the family, but the one whose arms are now charged with the greatest number of references to the historical incident is Sir John C. D. Hay, M.P. for Stamford. In the second and third quarters, with other charges, he bears a yoke, and each of his two crests are symbolic. The first is a rock, over which is the motto "Firm;" the second being a falcon rising. The supporters are two men in country habits, the dexter one holding in his hand a ploughshare, and the sinister holding an ox-yoke; while the motto is "Serva jugum" (Preserve the yoke).

The crest borne by the Stanley family, the head of which is the Earl of Derby, is most peculiar, viz., an eagle with wings extended, preying upon a child swaddled in a cradle, placed upon a *chapeau*. There are two versions as to the origin of this device. One is that the head of the Lathom family (from whom Earl Derby is maternally descended), wishing to get rid of a natural child, caused it to be placed in an eagle's nest. The bird, however, instead of killing the infant fed it, a circumstance which so affected the father that he brought up the boy as his acknowledged heir. The other tradition is that, in the reign of Edward III, one Sir Thomas Lathom, having an only daughter, desired an heir; and, having a natural son by one Mary Oskatel, he determined to acknowledge the child. To give a colourable pretext for introducing the boy into his family, he directed that it should be laid at the foot of a rock, where an eagle had built its nest. He then, in company with other persons, went to the locality of the rock, and pretended that he had accidentally discovered the infant. His wife adopted the child, who was subsequently known as Sir Oskatel Lathom. Before his death, however, Sir Thomas revealed the fraud, and left the bulk of his property to his daughter, the wife of Sir John Stanley, whose descendants altered the Lathom crest of an eagle regardant to that previously described.

A bull's scalp, which is the crest of the Cheney family, owes its origin to a peculiar action that is stated to have been performed by an ancestor. Sir John Cheney, an eminent soldier fighting under the banner of Henry of Richmond, at Bosworth, personally encountered King Richard, and was felled to the ground by that monarch, who also laid open the knight's helmet and knocked off the crest. For some time Sir John lay upon the ground stunned and uncared-for. Recovering himself, however, he cut the skull and horns off the hide of an ox which chanced to be near, and fixed them upon his own head to supply the loss of his helmet. Thus equipped, he returned to the field of battle, and did such signal service that, on being proclaimed king, Henry assigned to his faithful follower the crest since borne by his descendants.

For services of loyalty not performed on the battlefield many instances of grants of arms are extant. For instance, the Boycotts of Salop bear for their arms three grenades, and for a crest an armed arm casting a grenado. These were assigned by Charles II to Sylvanus Boycott, of Hinton, and his brother Francis, for having manifested their loyalty to his Majesty by sundry services in the times of his great distresses, in the same manner as their father had done to Charles I, by furnishing the army and garrisons with great shot, grenades, and other habiliments of war, and for their prudent deportment in sundry employments of trust, which deserved worthily of their prince and their country. The same monarch, who is not celebrated for acknowledging the claims of his adherents, also granted to Colonel Carlos the following arms, viz., an oak tree on a gold mount, and over these, on a red fesse (or band across the shield), three gold regal crowns, in recognition of the valuable services rendered in assisting him to preserve his life in the celebrated Royal Oak, and facilitating his escape at the battle of Worcester.

Among the curiosities of heraldry may be mentioned the crest borne by the Greenhill family, viz., a red demi-griffin, powdered with thirty-nine mullets (or stars of five pounds) which was granted in 1698 to a Mr. Greenhill, in commemoration of his being the thirty-ninth child of one father and mother. In future papers we shall return to the subject, as one not only of romantic incident but of historical interest.

AMONG THE LAPPS.

II.

AFTER various wanderings, we descended from the Fille Fjeld, and experienced the feelings which the new, the grand, the beautiful in nature can awaken, as we entered into those deep gorges which lead to the Sogne Fjord. This scenery was quite a contrast to the barren plateau of mountain, and even to the wider views of Southern Norway, with its dashing rivers and expanse of dusky firs. Colossal mountains hem in a narrow valley, which at last terminates in the fjord, or inland arm of the sea. It was the middle of June when we arrived at Leirdalsoren. There, from some cause or other, we had an altercation with our postboys in the streets, they doubtless presuming on our ignorance of the *skyds* law, and we on our part expressing the wrong idea with the wrong word. However, a gentleman passed by, and, seeing that we were English, interposed, solved the difficulty, and saw us comfortably settled in the inn. We asked our friend to tea, and obtained much interesting information from him. He informed us that he had a brother who was pastor among the Lapps up in Finmarken, and

who had been nearly murdered, owing to some religious outbreak which had taken place the year before. We were interested in the details, especially as we felt the romance attaching to the unknown; and, as our friend showed his confidence in our national character by a considerable loan to help us on our way to Bergen, we entertained, therefore, a grateful recollection of his services, his loan, and his information. As yet, the class of English who visit Norway for the most part are gentlemen; but we regret to have heard of instances of Englishmen not paying, and thus bringing disgrace on our national character, which stands high in Norway.

Three years afterwards I was travelling with the same two college friends up to the very north of Norway, in the coast steamer, and, as an election for the Storting was going to take place at Hammerfest, we began to get very crowded after leaving Tromsø, for the voters had to go to Hammerfest to vote personally. The member selected was an Englishman, who had long lived at Kaafjord, and had been naturalized, but who was the first instance of an Englishman being returned to sit in the Storting. Amongst other names, I heard that of Pastor Vosslef; and I thought, "Surely that was the name of the gentleman we met three years ago in the Sogne Fjord."

Awaiting an opportunity, I addressed the *prest*: "I believe your name is Vosslef; and, if so, I should be glad to know if you are brother to Herr Vosslef, who told us he had a brother who was *prest* in Finmarken."

"Undoubtedly that is my brother," he replied, in good English. "Did you meet him accidentally in your wanderings?"

"We did; and we are bound to entertain a grateful memory of him, for he was a good Samaritan to us in more ways than one, even to the practical lending us a handsome sum until we could reach our resources at Bergen. But he mentioned to us your adventure with the Lapps; are you the one to whom he alluded as having undergone that fearful ordeal?"

"Yes, I am the one. God be thanked we have survived it! I shall be happy to relate it to you briefly if you care to hear it."

"My parish," he began, "is at Kautskeino, a place now and then visited by English travellers, distant sixteen Norwegian miles from Alten. There are generally a great many Lapps in that neighbourhood who flit on the borders of Sweden or Norway, as the weather guides, the quantity of moss, or the state of the reindeer. Now, over the frontier in Sweden was a clergyman, by name Lestadius. This gentleman seemed more fitted for the Mosaic than for the Christian economy, from the austerity of his manners, and he used to preach very violent and exciting sermons. I need not tell you what is one of the prevailing sins of the Lapps."

"No; I have read of it in books, and perhaps saw glimpses of it when I visited some Lapps three years ago near Röraas. It is a sin which is a national disgrace to Englishmen as well as Laplanders—that sin of drunkenness."

The love of brandy is a great curse to these Arctic "Bushmen;" and, at marriages, fairs, or holiday-making, their reason returns only when the brandy is finished and the intoxication slept off; for, as long as there is any "Finkel," men and women, young and old, vie with each other in getting drunk, and are more like beasts than human creatures.

"Well, then, there was a great deal of drunkenness in his parish among the Lapps, and he was anxious to put down the evil to the best of his ability, and he suc-

ceeded in effecting a considerable outward reformation; but, with this reformation in manners, a great degree of spiritual pride and fanaticism was associated. The converts were urged to become preachers and apostles, whereupon they preached with the greatest violence, urging upon all the necessity of repentance. The contagion spread until it reached the Finns in the Norwegian territory, many of whom also became very fanatical. This was shown more and more by their behaviour. They began to treat their clergy and their superiors with marked insolence—to interrupt the service with howlings and other disturbances, so that broils during Divine service were of frequent occurrence."

"They forgot," I remarked, as the narrator paused, "that whatever may be our judgment as to the truth we hold, or the errors of our neighbours, the wrath of man can never work the righteousness of God."

"I remember well," continued the Norwegian pastor, "how once, in the middle of the service, one of them advanced towards the altar, and from thence cursed the officiating minister and denounced him as a traitor, and a wolf in sheep's clothing, whereupon a scene of great uproar ensued."

"Things went on getting worse and worse, until one morning our servant came running in to us in breathless haste to say that Lapps from the adjoining camp were coming, armed with weapons and intending to fight. They took us quite by surprise; they made an attack on the village, killing two persons, a tradesman and a policeman, and destroying property on all sides. A body of them attacked the parsonage; our resistance was hopeless: the windows were broken, the furniture was smashed, and they made me a prisoner, and, having bound me on the floor, I was, I may say, in immediate expectation of death. They then formed rods of birch boughs and commenced flogging me, which they continued to do more or less the whole day, until my flesh was raw and bleeding, and the room covered with the broken twigs. The only trait of humanity which I am glad to record is that they did not molest my wife, nor actually ill-treat her, on whose account I was in terrible suspense as she was on the eve of her confinement. In this way the miserable day dragged its slow length along; we were comparatively alone in these upland wilds, at the mercy of these fanatics, but one remove from savages; yet, nevertheless, under the protection of God. One of our peasants had made his escape early in the morning, and had gone to a neighbouring settlement to bring succour. But it was not until nightfall that the joyful shout announced that help was at hand. The pillagers hearing the noise, and suspecting that vengeance would ensue, left beating the prisoners and rallied for battle. An indiscriminate *mêlée* then began, which lasted for more than an hour, at the end of which the rioters had lost two or three killed, and several wounded, while the rest were overpowered and secured. In due time they were taken down the valley and tried on the charge of insurrection and murder; one of them was executed, and the rest sentenced to imprisonment and hard labour—some for life, others for a term of years."

"Your brother did not exaggerate when he told me in '53 that you had been nearly murdered by the Lapps in Finmarken, but I little expected to have the pleasure of meeting you and hearing the narrative from your own lips. As regards their views, did you learn any details, so as to be able to refer their conduct to any class of phenomena such as fallen, and especially fanatical, human nature from time to time presents?"

"I fear their character is described in 2 Peter ii. 10," continued he, referring to his Bible: "'But chiefly them that walk after the flesh in the lust of uncleanness, and despise government. Presumptuous are they, self-willed, they are not afraid to speak evil of dignities.'"

"They, like the Anabaptists in Germany, were great adepts at quoting the Old Testament to suit their purposes, and to veil the self-righteous pride of their own bigotry. They forgot that religion must begin in the heart, and subdue every disposition to the law of Christ; that a humble and holy love, and a chastened will, are the brightest fruits of true godliness. They were satisfied with washing the outside of the cup and the platter, laying an undue emphasis on external reformation, as seen in their enforced temperance. Upon this an extraordinary, not to say absurd amount of spiritual pride and egotism developed itself, which, under circumstances less painful, would border on the ludicrous. They assumed to themselves a power in heaven and earth; they declared that they had received the gift of the Holy Ghost, direct from heaven; they were the sons of God, and therefore could sin no more; and I remember that when I was lying bound on the floor, between every stripe of their flogging they asked me, 'Are we the sons of God? Have we the Holy Ghost? Can we sin? Do you admit we are right?' To which I replied that their conduct did not afford any evidence of the truth of their tenets, if it was to be judged by its results and fruits. They then renewed their attack with redoubled vigour, shouting out these questions with a demoniacal wildness. Their further assertion was but a natural step in the path of self-delusion and arrogance. They declared that, having received the Holy Ghost from heaven, they were above the written Word of God, and did not need the Scripture, which they now both disregarded and despised. They paid great attention to the feelings, by which I mean the transient emotions which arise from heated brains and misguided impulses. They said that you must have a personal assurance from Christ himself, or an angel from heaven, of the forgiveness of your sin; and that you must have been present, in body and soul, both in heaven and hell. Those persons who could respond to the above tests of experience were acknowledged as brothers, while the moderate and sincere were branded as heretics and wicked sinners, worthy of vengeance and destruction. Many persons were, from their great fury and perseverance, frightened into compliance with their creed, lest they should have become objects for their vials of wrath."

"Thank you much for your narrative," I replied. "We know that history often reproduces itself in facts of this kind, and that as human nature, so far as its sinfulness goes, is the same everywhere, so its developments under parallel circumstances are often analogous. The setting oneself up above the written Word of God is one of the usual developments of spiritual pride and misguided fanaticism. But I suppose we shall soon reach Hammarfest, where perhaps we shall separate for ever. If so, may the bonds of the Gospel unite us to the great living Head of the Church, that we may meet with joy on the final day of the world's history."

Thus we parted with Pastor Vosslef.

ABYSSINIAN NOTES.

DR. BLANC'S DIARY.

In the "Times of India" has been published a long diary, written by Dr. Blanc, formerly resident surgeon at Massowah, one of the captives of King Theodore.

Like the journal of Mr. Rosenthal, printed in our January part, Dr. Blanc's manuscript is described as a marvel of neatness, exhibiting the utmost patience and care. Paper and ink being scarce at Magdala, the most has been made of a little space, and the writing is close and compressed. We may add that the Abyssinian ink is such that care had to be taken lest it should be rubbed off the paper.

Dr. Blanc's narrative gives an account of the first reception by the King, strangely contrasting with the subsequent treatment of the prisoners.

In a valley between the hills a large body of cavalry, about 20,000 strong, formed a double line, between which we advanced. On our right, dressed in gorgeous array, and all bearing the silver shield and the Bitwa, the horses adorned with richly-plated bridles, stood the whole of the officers of his Majesty's army and household, the governors of provinces and of districts, etc.; all were mounted, some on really noble-looking animals, tribute from the plateaux of Gedjars and the highlands of Shoa. On the left, the corps of cavalry was darker, but more compact than its aristocratic *vis-à-vis*. The horses, though on the whole, perhaps, less graceful, were strong and in good condition, and seeing their iron ranks we could well understand how thunder-stricken the poor scattered peasants must be when Theodoros, at the head of the well-armed and well-mounted band of ruthless followers, suddenly appears among their peaceful homes, and, before his very presence is suspected, has come, destroyed, and gone. In the centre, opposite to us, stood Ras Engeddah, the prime minister, distinguished from all by his gentlemanly appearance and the great simplicity of his attire. Bareheaded, the shama girded in token of respect, he delivered the imperial message of welcome, translated into Arabic by Samuel, who stood by him, and whose finely-chiselled features and intellectual countenance at once proclaimed his superiority over the ignorant Abyssinian. Compliments delivered, Ras and ourselves mounted, and advanced towards the imperial tents, preceded by the body of mounted grandees, and followed by the cavalry. Arrived at the foot of the hill, we dismounted, and were conducted to a small red flannel tent pitched for our reception on the ascent itself. There we rested for a while, and partook of a slight collation. Towards three o'clock we were informed that the Emperor would receive us; we ascended the hill on foot, escorted by Samuel and several other officers of the imperial household. As soon as we reached the small plateau on the summit, an officer brought us renewed greetings and compliments from his Majesty. We advanced slowly towards the beautiful durbar-tent of red and yellow silk, between a double line of gunners, who, on a signal, fired a salute very creditable to their untaught skill. Arrived at the entrance of the tent, the Emperor again inquired after our health and welfare. Having acknowledged with due respect his courteous inquiries, we advanced towards the throne and delivered into his hands the letter from her Majesty the Queen. The Emperor received it civilly, and told us to sit down on the splendid carpets that covered the ground. The Emperor was seated on an alga, wrapt up to the eyes in a shama—the sign of greatness and of power in Abyssinia. On his right and left stood four of his principal officers, clad in rich and gay silks, and behind him watched one of his trusty familiars holding a double-barrelled pistol in each hand. The king made a few complaints about the European prisoners, and regretted that by their conduct they had interrupted the friendship formerly existing between the two nations. He was happy to see us, and hoped that all would be well again. After a few compliments had been exchanged, on the plea that we must be tired, having come so far, we were allowed to depart.

This was towards the end of January 1867. They travelled with the king, halting at various places, till the captives, whose freedom they had come to ask, were sent for. They arrived on the 16th of March at Zagay.

On the 17th we received a message from his Majesty, telling us to go to him, as he desired to try before us the Europeans who had, he said, formerly insulted him. As soon as we approached, his Majesty rose and saluted us—received us, in short, as if we were still his honoured guests, and not the heralds from a great Power he had recently so grossly insulted. We were told to sit down. A few minutes of silence followed, and we saw advancing from an outer gate our countrymen, guarded as criminals, and chained two by two. They were

arranged in a line in front of his Majesty, who, after observing them for a few seconds, "kindly" inquired after their health, and how they had spent their time. The captives acknowledged these compliments by repeatedly kissing the ground before the King, who all the time grinned in delight at the sight of the misery and humiliation of his victims. The Emperor's pedigree was first read; from Adam to David all went on smoothly enough; from Solomon's supposed son Messilek to Socinius few names were given, but perhaps they were patriarchs in their own way; but when it came to Theodorus's father and mother the difficulty increased—indeed, became serious; many witnesses were brought forward to testify to their royal descent, and even the opinion of the puppet Emperor Saharius was recorded in favour of Theodorus's legal right to the throne of his ancestors. After that the trial of the captives began. These unfortunate and injured men answered with all humility and meekness, and endeavoured by so doing to avert the wrath of the wretch in whose power they were. Their trial ended, we were called forward, and, in conclusion, his Majesty said, addressing himself to us, "Wherever I go, you will go; wherever I stay, you will stay." On that we were dismissed to our tents, and Captain Cameron was allowed to accompany us. The other Europeans, still in chains, were sent to another part of the camp, where several weeks before a fence had been erected, no one knew why. The following day we were again called before his Majesty, but this time it was quite a private affair. The prisoners were brought in; the Emperor bowed his head to the ground, and begged their pardon; they asked for his. The reconciliation effected, the Emperor dictated a letter for our Queen, and Mr. Flad was selected to convey it. The audience over, the prisoners were brought to our tents and their chains opened. We then all had our tents pitched into a large enclosure fenced that very morning, under his Majesty's supervision. We were once more all mixed, but this time all prisoners. Flad left; we expected that his mission would be successful, and that England, disgusted with so much treachery, would not condescend to treat further, but enforce her commands.

As the summer wore on, the king again commenced to ill-treat his guests. He had heard, or pretended to have heard, that the Turks were making a railway in the Soudan, to attack his country along with the English. He was angry with Mr. Rassam for not having told him of this.

On the 3rd of July an official brought us the Imperial compliments, and stated that his Majesty was coming to inspect the works, and that I might present myself before him. I went at once to the foundry, and on the road I met two of the Gaffat workmen also proceeding there. A little incident then occurred, which was followed by serious consequences. We met his Majesty near the foundry, riding ahead of his escort; he asked us how we were; and we all bowed and took off our hats. As he passed along, the two Europeans with whom I walked covered themselves, but, aware how touchy his Majesty was on all points of etiquette, I kept my head uncovered, though the sun was hot and fierce. Arrived at the foundry, his Majesty again greeted me cordially; examined for a few minutes the drawing of a gun his workmen proposed to cast for him, and then left, all of us following. In the courtyard he passed close to Mr. Rosenthal, who did not bow, as his Majesty took no notice of him. As soon as he issued from the foundry fence a poor old beggar asked for alms, saying, "My lords (gaitosh) the Europeans have always been kind to me; oh! my King, you also relieve my distress!" His Majesty on hearing the expression "lord" applied to his workmen got into a fearful passion. "How dare you call any one 'lord' but myself? beat him, beat him by my death." Two of the executioners at once rushed upon him, and began beating him with their long sticks, his Majesty all the while exclaiming, "Beat him, beat him by my death." The poor old cripple at first, in heartrending terms, implored for mercy, but his voice grew fainter and fainter, and in a few minutes more there lay his helpless corpse, that none dare remove or pray for. The laughing hyenas that night caroused undisturbed on his abandoned remains. Theodorus's rage was by no means abated by this act of cruelty; he advanced a few steps, stopped, turned his lance in its rest, looking around, the very image of ungovernable fury. His eyes fell upon Mr. Rosenthal—"Seize him!" cried he. Immediately several soldiers rushed forward to obey the imperial command, "Seize the man they call an akim." Instantly a dozen ruffians pounced upon me, and I was held fast by the arms, coat, trousers—by every place that afforded a grip.

He then addressed himself to Mr. Rosenthal: "You donkey, why did you call me the son of a poor woman? Why did you abuse me?" Mr. Rosenthal said, "If I have offended your Majesty, I beg for pardon." All the while his Majesty was shaking his lance in a threatening manner, and every minute I expected that he would throw it. Fortunately for us both he turned towards his European workmen, and abused them in no measured terms: "You slaves! have I not bought you with money? Who are you that you dare call yourselves 'lords'? Take care!" Then, addressing the two I had met on the road, he said: "You are proud, are you? Slaves! women! rotten donkeys! you cover your head in my presence; did you not see me? Did not the akim keep his head uncovered? Poor men that I have made rich!" He then turned towards me, and, seeing me held by a dozen soldiers, he cried out, "Let him go. Bring him before me." All drew back except one, who conducted me to a few feet from the Emperor. He then told Mr. Schange to translate what he was going to say: "You, akim, are my friend. I have nothing against you, but others have abused me, and you must come up with me to witness their trial." He then ordered Cantiba Hailo to give me his mule. He then mounted, I and Mr. Rosenthal following, the latter on foot, dragged the whole way by the soldiers who had first seized him. As soon as we reached Debra Tabor the King sent word to Mr. Rassam to come out with the other Europeans, as he had something to tell him. The King sat upon a rock about twenty yards in front of us; between him and ourselves stood a few of his high officers, and behind us a deep line of soldiers. He was still angry, breaking the edges of the rock with the butt-end of his lance, and spitting constantly between his words. He at once addressed himself to the Rev. Mr. Stern, and asked him, "Was it as a Christian, a heathen, or a Jew, that you abused me? Tell me where you find in the Bible that a Christian ought to abuse? When you wrote your book, by whose authority did you do it? Those who abused me to you, were they my enemies or yours? Who was it told you evil things concerning me?" etc. He then asked Mr. Rassam whether he knew or not that Jerusalem belonged to him, and the Abyssinian convent there had been seized by the Turks; that, being a descendant of Constantine and Alexander the Great, India and Arabia belonged to him? He put many foolish questions, and of the same kind. At last he said to Samuel, who was interpreting, "What have you to say if I chain your friends?" "Nothing," replied Samuel; "are you not the master?" Chains had been brought, but the answer somewhat pacified him. He then addressed one of his chiefs, saying, "Can you watch these people in the tent?" The other, who knew his answer, replied, "Your Majesty, the house would be better." On that he gave orders for our baggage to be conveyed from the black tent to a house contiguous to his own; and we were told to go.

The King sent us several messages. Mr. Rassam took advantage of the circumstance to complain bitterly of the unfair treatment inflicted upon us. His Majesty sent back word: "If I treat you well or not, it is the same; my enemies will always say that I have ill-treated you, so it does not matter." A little later we were rather startled by a message from his Majesty informing us that he could not rest before comforting his friend, and that he would come and see us. Amongst other things, he said, "My father was mad, and though people often say that I am mad also, I never would believe it; but now I know it is true." Mr. Rassam answered, "Pray do not say such a thing." His Majesty replied, "Yes, yes, I am mad!" Shortly before leaving he said, "Do not look at my face or take heed of my words when I speak to you before my people, but look at my heart; I have an object." As he returned he gave orders to the guards to withdraw outside, and not to inconvenience us. Though we have seen him since then once or twice, at a distance, it is the last time we conversed with him.

Theodorus is described as "about forty-eight years of age, darker than many of his countrymen; his black eyes are slightly depressed, the nose straight, the mouth large, the lips small; he is well knit, a splendid horseman, excels in the use of the spear, and on foot will tire his hardest followers. When in good humour the expression of his face is pleasing, his smile attractive, his manners courteous, really kingly; but when in anger his aspect is frightful, his black face acquires an ashy hue, his eyes are blood-shot and fierce, and his whole deportment is that of savage and ungovernable fury."

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

"STUPID WOMAN! IS THAT THE WAY YOU HAVE BEEN TAUGHT TO READ?"

THE MORTONS OF MORTON HALL.

CHAPTER XII.—EXCITEMENT IN THE VILLAGE OF ST. DAVID.

MR. ASTON received a prompt and favourable reply to his letter. Mr. Sinclair stated that Cliff Cottage, which was the name of the dwelling to which Mr. Aston had alluded, might be engaged either for a few months or for a term of years, and that a few days would suffice to put it in perfect repair. Furniture, as Mr. Aston had said, could be easily procured from Falmouth, and though the engagement of suitable servants might be a somewhat difficult

matter, he (the rector) would use his best endeavours to procure the servants who would be required.

The rector and his niece both expressed their delight at the prospect of seeing Mr. Aston at St. David again, and invited him to come down forthwith and take up his abode in his old quarters at the Rectory, until the repairs going forward at the cottage were completed.

It was a stirring time at St. David. A very small matter suffices to create an excitement among the inhabitants of a secluded country village, and day after day, from dawn to nightfall, all the idlers and children of the village congregated around Cliff Cottage, and watched the

workmen as eagerly as if their own comfort and convenience depended upon the result of the various alterations and improvements that were being made.

Immediately after he had received Mr. Aston's letter Mr. Sinclair had sent directions to various tradesmen and shopkeepers at Falmouth, to commence and complete with all possible despatch the necessary repairs and alterations required at the cottage; and as the new tenant had declared that the cost was a matter of no consequence to him, these tradesmen and their *employés* were at work, busy as bees, from daylight until dark. Miss Wardour had been requested, and had promised to superintend the interior arrangements of the cottage, and the Falmouth upholsterers had received a *carte blanche* from Mr. Aston to furnish the rooms in suitable style, from cellars to attics, under the young lady's directions, without regard to expense. Gardeners were engaged to put the long-neglected gardens and shrubberies into perfect order; and the rector and Doctor Pendriggen, and even the new curate, Mr. Sharpe, each and all glad of some little change from the ordinarily quiet routine of their daily duties, occupied themselves in superintending the work, and were continually contradicting each other and themselves, and sometimes almost driving the gardener and his assistants frantic with their impracticable suggestions.

At this period Mary Talbot had been settled at St. David some five or six weeks, and had already won the respect and esteem of the rector and his friends.

With the exception of Doctor Pendriggen and Mr. Sharpe, there were no residents within the parish of St. David who were on terms of intimacy with the rector and his niece, the great body of the population consisting of poor farmers and poorer fishermen and their wives and families—good, honest folk in their way, but not of a class with whom persons of education and refinement could mingle on terms of social equality.

Nor were there any resident gentry in the immediate neighbourhood of St. David. Sir Charles Meldrum, an old Cornish baronet, and his lady and family, were, in fact, the only visitors from beyond the limits of the parish who ever made their appearance at the Rectory, and their visits were only paid at long intervals.

Meldrum Abbey, the seat of Sir Charles Meldrum, was ten miles distant from St. David, in the adjoining parish of St. Colomb, and usually the family came down from London to spend a month or two of the autumn at their seat in Cornwall.

On these occasions Miss Wardour was in the habit of passing a week or two at the Abbey with Lady Meldrum and her daughter, and during their stay the family generally came over to St. David, and spent a few days with the rector and his niece. At all other times Miss Wardour was absolutely isolated from the society of young persons of her own sex and age, and as it sometimes happened that the baronet and his family missed their usual visit to the Abbey, the young lady was on these occasions deprived of the holiday to which she had looked forward for months with eager anticipation.

It may therefore be readily imagined that while Mary Talbot was regarded by the rector and Doctor Pendriggen and Mr. Sharpe as an acquisition to the society of the little village, she was especially welcome to Miss Wardour, and that the two young ladies soon became intimate friends.

In his own parish Mr. Sinclair reigned paramount; and it would be well if every country parish in England were presided over by an autocrat of equal goodness and benevolence. Nevertheless, many of the clergy of the adjacent parishes smiled at what they termed the

Arcadian schemes of the worthy rector; and when they heard that he had engaged a young person of superior education to superintend his schools, they predicted the failure of his plans, as they had previously predicted the failure of various other philanthropic projects, which, however, had generally proved successful.

Even Doctor Pendriggen, who had a blunt habit of speaking his mind freely (acquired, probably, during his service on shipboard), which was apt to give offence to strangers, but which was tolerated and laughed at by those who knew his sterling qualities—even Doctor Pendriggen, I repeat, expressed his opinion to the rector that his present scheme was only calculated to turn the heads of the village girls, and render them unfit for the humble duties of their station.

The doctor was opposed to what he termed the over-education of the working classes.

"Teach them to read, and to write their names, and sum up their daily household expenses," he said, "and that's quite enough for girls whose lot it is to become the wives of farm labourers and fishermen. I don't know that it isn't too much. Their mothers and grandmothers got along without any education at all.

"Do tell me," he went on, "what this young lady whom you have engaged is to do? Is she to teach our rude honest fisher-girls fine ladyism, to teach them to dress smart, and waste their time in idleness, and scorn their humble homes, and rough, uneducated husbands—if they can find any honest hardworking men so foolish as to marry them?"

"On the contrary, my dear doctor," replied Mr. Sinclair, with a smile at the bluntness of his friend's speech, "I hope they will be taught *not* to waste their time in idleness, but to dress neatly, and to make the most of their humble homes, and to render their husbands happy and content with the comforts they can find at home, and thus keep them from spending their evenings in the alehouse. I hope," he continued, "that the new governess will instruct them by precept and example in those duties which are not generally taught within the walls of a school-room; and for that purpose I have engaged her. I have no fear of the result of the educational movement which is just beginning to make itself manifest in our land. I only regret that it has been so long delayed. I am aware that it is feared by many; but so has been every progressive movement from the earliest ages. Education, however humble, is a species of riches beyond the reach of misfortune. It cannot make itself wings and fly away from its possessor, and in my opinion, if it be properly imparted, so far from inducing the poor and lowly to neglect the rude yet necessary duties of humble life, it will lead them to strive to perform these duties more perfectly. I intend the young lady whom I have now engaged to teach the poor farm and village girls how to carry the instruction they receive at school into their homes, to teach them that their education need not and should not be ended when they quit school; and that intellectual culture is not incompatible with honest, humble labour.

"Moreover, Miss Talbot will be of great assistance to Miss Wardour in those parish duties which properly appertain to the clergyman's wife, but which, as I am not a married man, my niece has latterly undertaken to perform; and so far I am well satisfied with her zeal and ability."

"If your plan were generally followed," replied Doctor Pendriggen—partially convinced that the rector was right, yet unwilling to acknowledge that such was the case—"we should soon find none willing to be servants or to occupy menial situations. All would

want to be masters and mistresses, and society would become disorganised."

"I anticipate no such unhappy result," continued the rector. "The progress of one class of society necessitates the progress of all classes. I anticipate, therefore, no such social convulsion as you and others pretend to dread. At all events, I shall strive to do my duty to the utmost of my power, and shall endeavour to promote the temporal comfort and happiness, as well as the spiritual welfare of the people committed to my charge."

"Of that I am convinced," replied the doctor. "I may, and do sometimes, differ in opinion from you; but I know that your chief object in life is to benefit others, and that, from the happiness you diffuse around you, you derive your own greatest pleasure."

This conversation occurred very shortly after Mary Talbot's arrival at St. David, and before many more weeks had elapsed, Doctor Pendriggen, as was usual with him in the end, confessed to a change of opinion, and acknowledged that the new governess was likely to prove something more than a mere acquisition to the society of the village.

Mr. Sharpe had admired the young lady from the moment of his first introduction to her, and the people of the village thought well of her, though they generally thought her too young and too ladylike for a "school-missus."

The children of the schools, however, soon became very fond of their new teacher; and perhaps the only persons in the village who did not regard Mary with favour, were the two village schoolmistresses who had the immediate charge of the children, and who were naturally jealous of any interference with their authority, and unable to perceive the object of the rector in placing a governess over them.

Miss Wardour was glad to call Mary to her assistance when she took upon herself the task of superintending the furnishing and interior decoration of Cliff Cottage; and for more than a week the two young ladies were somewhat neglectful of their proper duties, while busily occupied in visiting half the shops of Falmouth, and in choosing carpets and curtains, and linen and crockery ware, and cooking materials, and all the various paraphernalia essential to a widower's, or bachelor's household.

As a matter of course, while thus occupied their conversation frequently turned upon the individual whose anticipated arrival had created such a stir in the usually quiet village, and whom Mary Talbot had never seen.

"We really know very little respecting this gentleman, my dear," said Miss Wardour one day, in response to Mary's inquiries, "though he was my uncle's guest for several weeks. He was shipwrecked on the coast, in the bay yonder, where, up to a few weeks since, portions of the wreck of the vessel in which he was a passenger were still to be seen at low tides.

"He suffered some injury from the wreck, and my uncle invited him to the Rectory rather than he should remain in the 'public'—the only accommodation for strangers that our village affords. He remained with us until he was able to travel, and we found him to be a very gentleman-like, intelligent man, though somewhat eccentric in his manner. When he set out for London he promised to write to us; but we heard nothing of or from him until the other day, when he wrote to say that he had met with some disappointment in searching after his friends or relatives; that he had been ill, and that, as he had been recommended by the doctor who attended him, to take up his residence on the sea coast, he proposed to occupy Cliff Cottage for a season, if it

were still untenanted. I presume he will be here in the course of another week; and now you know almost as much of Mr. Aston as any of us do."

"But what sort of person is he? Is he a young man? Is he rich? And what is he?"

"Four questions at once, my dear," said Miss Wardour, with a smile. "Well, I will reply to them to the best of my ability. He is certainly not a young man, neither is he *un beau garçon* for his years—for which I like him all the better. Still, he is evidently a gentleman, and I believe that he is a rich man. Indeed he showed my uncle several letters from a banker in London respecting the investment of his money, which afforded proof that he is the possessor of considerable wealth. Furthermore, he is an Englishman by birth, who has travelled far and wide, and has resided many years in America, where he married, and where his wife died. He is now a widower, with a grown-up son and daughter who are in America. As to what profession he follows, or has followed, or whence he has derived his wealth, I know no more than you. And now I think I have replied to the best of my ability to all your questions."

"What brought him to England?"

"You are really very inquisitive respecting this gentleman, my dear," replied Miss Wardour smilingly. "If he were a younger man I should not know what to think. Perhaps I might be jealous. But, joking apart, you ask more than I can answer. My uncle suspects that he has come to look after some property of which he has been deprived, or after some relatives or friends. But he was exceedingly reticent while with us respecting the object of his visit to England, though he was communicative enough on all other matters. You have not any relation of whom you have not heard for half a century, who might turn up and bequeath you a fortune, have you?"

"Indeed no," replied Mary, smiling at the idea. "My relations, both on my father and mother's side, are, I believe, all dead long ago. I have no relatives living, to my knowledge, excepting some distant cousins who would not care to acknowledge me in my present humble condition, and whom I do not care to know. So you see I have no other reason than mere curiosity in asking for information about this gentleman."

"Here is Langley's shop," said Miss Wardour; and the young ladies entered a linen draper's shop in the High Street of Falmouth, and were soon deeply engaged in selecting and matching patterns for blinds, window-curtains, etc., etc.; complaining the while of the irksomeness of the task of selecting and purchasing goods for another person, who might not be satisfied with their purchases, yet withal feeling a pleasurable excitement in the occupation of shopping, even though the goods they purchased were not for themselves.

CHAPTER XIII.—MR. ASTON LISTENS TO READINGS.

WHEN at length Mr. Aston arrived at St. David his friends found a great alteration in his appearance. He had never entirely recovered from the effects of the injuries he had sustained at the time of the wreck of the Powhattan; and the anxious, hurried life he had since led, the disappointments he had met with in his search after his lost relatives, and the long journey he had undertaken, from London to Cornwall, just after having risen from a sick-bed, at a time when travelling was neither so speedy nor so comfortable as it is at the present day, had told severely upon him. His medical advisers, when they recommended a sojourn by the seaside, had had no idea that he intended to travel farther than Ramsgate or Brighton, and he reached St. David

so completely exhausted that it was apparent to his friends that if he did not take great care of himself he would soon be again under the doctor's hands.

They advised him to keep himself perfectly quiet at the Rectory for a few days, until he had quite recovered from the fatigues of his journey. He, however, was not the man to heed such advice. Moreover, he was impatient to take possession of his new residence, with which he was perfectly delighted, and, despite the warning of his friends and the protestations of the doctor, he insisted upon removing to the cottage before the newly-repaired dwelling was thoroughly aired. The result was that he was attacked with acute rheumatism, and again confined to his bed.

Unused to confinement—for, until his return to England, he had never had a day's serious illness since his boyhood—he was a most intractable and refractory patient. Accustomed from the days of his childhood to a life of active exertion, he could not endure quietude and repose, and as he was forbidden, and indeed was unable to exert himself in any way, and was prohibited even from reading, time hung heavily and wearily upon his hands, and the man and two female servants, whom Mr. Sinclair had succeeded in engaging for him, had a hard time of it for a while with their new master.

Mr. Sinclair and his curate, and Doctor Pendriggen, of course visited him daily; but the visits of these gentlemen filled up but a small space in the long hours of daylight, and idle hours by day brought restless, sleepless nights, which tended to prolong the disease from which he suffered. At length, however, the doctor pronounced him convalescent. He was permitted to sit up, or recline upon the sofa in the parlour; but still, books were forbidden him, and, except by reading, his condition precluded any method of occupying his time.

The doctor suggested that he might engage one of the village school-girls to read to him.

"Pshaw!" exclaimed the invalid, "I'll have no snivelling school-girl to sing-song to me. That would be worse than the purgatory I suffer."

"Our new governess, or Miss Wardour, would certainly be better adapted to the task," replied the doctor; "but it would not be exactly the thing for either of them to do, even if they were willing."

"I don't want any one to trouble themselves about me," answered the invalid, petulantly; and with this the doctor took his departure. But he had no sooner gone than Mr. Aston, in spite of the restrictions laid upon him, hobbled to the book-shelves, selected a book, and began to read. Very soon, however, he found his head begin to ache, and his eyes to grow dim; the letters seemed to swim before him, and in a rage he flung the book from him, and endangered a relapse through the passion into which he worked himself.

The next day Mr. Sinclair called at the cottage and was admitted by the man-servant.

"How is your master?" he inquired of the man.

"He's in a worsor tantrum than ever, I think, sir," replied the servant. "He be in the parlour 'long with the housekeeper."

The rector, who was accustomed to announce himself, stepped towards the parlour, but he stopped short outside the door on hearing the voice of the invalid raised in high altercation.

"You stupid woman!" cried the sick man. "Is that the way in which you have been taught to read?"

"Please sur, aw wun't read at a' never no more," replied the housekeeper; and as she was about to leave the room Mr. Sinclair entered, and inquired after the health of the invalid.

"I'm getting better, if I'm to believe what the doctor says," replied Mr. Aston; "but I'm bored out of my life by the stupidity of the servants." And as he spoke he looked earnestly at his visitor, as if ashamed that the rector had heard his angry voice.

"Pray be seated, Mr. Sinclair," he presently continued. "I'm glad to see you. It's really a charity on your part to call upon a poor querulous invalid like me. Upon my word I think Pendriggen is trying to drive me mad. Here I sit the livelong day, listening to the roar of the sea, like a captive in his dungeon, with nothing whatever to employ my time. I've been trying to get old Margery to read to me, but I'd as soon listen to a cat squalling. I asked Thomas whether he could play chess, and the fellow didn't know what I meant. He said he used to play 'cris-crass' when he were at schule, if that were it—the idiot!"

"Do *you* play chess?" inquired Mr. Sinclair. "I am very fond of a game at chess, and neither the doctor nor Mr. Sharpe can play the game. My niece plays a little, but it's too serious a game for her. I should be glad to meet an able antagonist, and I shall be very happy to play a game some evening with you, if it will be any pleasure to you."

"No!—would you indeed, though?" exclaimed the invalid, brightening up.

"I shall, really. You *must* be weary with sitting here so many long hours alone, with no one to amuse you or converse with you. Mr. Sharpe, I am sure, will be happy to visit you now and then; and Miss Wardour will call and see you, now that you are able to sit up. I'll tell her, and ask her to bring our new governess along with her. You haven't seen the young lady yet, I think, though you are indebted to her taste as well as to my niece's for the arrangement of your rooms. I'm sure you'll be pleased with her. She reads charmingly too, and I'm sure both Miss Wardour and she will be glad to read to you now and then, if you wish it."

"Doctor Pendriggen was speaking about the new governess yesterday," replied Mr. Aston, who did not seem to entertain the idea that a village school teacher would be a very desirable acquaintance. "Have you changed your schoolmistresses since I have been absent?"

"Oh no. This is a young lady whom I have engaged to *superintend* the schools, and to be a companion and assistant to my niece, who has really more to do than she is able to attend to."

"What is the young lady's name?"

"Talbot—Miss Mary Talbot."

"Talbot! Mary Talbot!" repeated Mr. Aston, starting with surprise.

"You know some person of that name?" inquired the rector, remarking the manner of the invalid.

"I have met with some Talbots," replied Mr. Aston, endeavouring to conceal the agitation the mention of the name had caused.

"Talbot is a good name for a village school governess to bear," he added.

"Yes," said Mr. Sinclair, smilingly; "but we sometimes meet with Howards, and Percys, and Cavendishes among the lowest grades of society. However, Miss Talbot is a lady by birth and education. Both her parents, as I have learnt from a friend—for the young lady never boasts of her family connections—belonged to highly respectable families. Her father was formerly in the navy, and was lost at sea not very long since—in the same gale, in fact, during which you were shipwrecked—while in command of an East Indiaman. The family were reduced to poverty through his loss; the

widow died shortly afterwards, and Miss Talbot—very properly—determined to earn her livelihood by her own exertions, rather than be dependent on the benevolence or charity of others.”

“Her parents are both dead, then? Has she brothers and sisters?”

“One brother only—younger than herself.”

“She is young, I suppose?”

“About twenty or twenty-one years of age.”

“Poor thing! Hers must be an interesting story. I should very much like to see her. You will ask Miss Wardour to visit me, if she will so far favour a crusty old invalid; and tell her to bring this young governess with her.”

“I will,” returned Mr. Sinclair; “and I think I may promise that you shall receive a visit from both the young ladies to-morrow.”

“And don’t forget the game at chess.”

“Certainly not. You may expect me to-morrow evening. So prepare for defeat. I rather pride myself upon my skill at chess.”

Shortly after this Mr. Sinclair took his leave.

“Can it be possible that this young governess is Mary’s child?” soliloquised Mr. Aston, as soon as he was left alone. “It will be strange indeed if, after all my vain researches throughout Great Britain, I should find a niece in this secluded village. All that Mr. Sinclair has told me tends to confirm the suspicion that this young girl is the daughter of Lieutenant Talbot. The name is not a common one, and her father was a sailor. I must see the girl; and if she be indeed my niece, I will not yet make myself known to her. I will watch over her; and, if she be worthy of my regard, I will declare myself to be her uncle, and raise her from poverty to her proper position in society. Yet, if this girl be my niece, my sister is dead. Poor, poor Mary!”

Long after Mr. Sinclair had left him, Mr. Aston sat silently recalling the memories of the past; and that evening the servants of the household found a great change in the demeanour of their master. He was kind, and even gentle in his manner towards them; and they began to fear that the change betokened evil, and that he was going to die.

Many a story was told in the kitchen of Cliff Cottage that evening, of the sudden changes that had come over people who had been forewarned that their death was at hand, and the housekeeper declared that she would not be surprised if her master was found dead in his bed in the morning.

“Yet, arter a’,” she added, “we may be a troublin’ ourselves for nought. T’ rector heerd maister grum-pin’ at me t’ morn, and aw shouldn’t wonder if his reverence ha’ gin him a bit o’ lecture about it.”

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDE.

“Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd.”

COWPER.

II.—NEWSPAPER MAGIC AND MODERN WITCHCRAFT.

WHEN Cowper, from the snug Olney parlour, so heartily proclaimed the pleasure of contemplating the world at a distance, and peeping at it through the loopholes of retreat, he had that world’s epitome of news spread before him. It was in his day a modest “folio of four pages,” which had just been brought to him by the

“herald of a noisy world,” the postman, who is even now to be seen in country districts, in form and appearance not much altered from the “light-hearted wretch” who twanged his horn within hearing of the poet of “The Task.” But how changed is that newspaper which he carries and delivers! No longer is it a “happy work, which not even critics criticise;” for its contents are conned over and discussed with the most searching criticism, and now and then provide fruitful subjects for legal trials. But while it has grown far beyond the modest dimensions that it bore when Cowper welcomed it to his snug retreat, it has correspondingly increased and improved in all other particulars; becoming a leviathan in power as well as shape; gathering its information from a wider source; producing it in a far more intelligent manner; and disseminating it at a cheaper rate and with wondrous mechanism.

When Cowper received that modest sheet, where-with, as he read it aloud, he held “inquisitive attention fast bound in chains of silence,” there were barely, in all England, so many as sixty newspapers. But now, there are more than two hundred metropolitan and upwards of a thousand provincial newspapers published each week. They penetrate into every district throughout the length and breadth of the land; they largely influence the public mind, and thereby shape the course of public events; and they unquestionably exercise an important bearing on national education. The newspaper is the only modern production of literature that is read by thousands of Englishmen, especially in rural districts. And to meet their demands, if not to satisfy their wants, and to instruct them as to their neighbours’ doings, there are few villages at the present day, whose noteworthy events are not chronicled in the columns of a local newspaper. This paper, although published in the nearest county town, has, probably, the half of its contents printed in London; for by this method—which supplies similar sheets to a dozen or twenty different towns—the country proprietor is enabled to purchase, at a cheap rate, reams of London prepared journals, the blank half of which he can fill up with local news and advertisements, and sell for a penny a copy, to the mutual advantage of himself and the dwellers in his district.

The specimen of miscellaneous news, criticism, and information that he is thus enabled to set before his purchasers, is undoubtedly a vast improvement on “th’ important budget” of Cowper’s time. Every rustic who can spell the words of his penny paper is now enabled, by its magic power, to peep through the loopholes of retreat and see how the great world is stirring, and how it fared with far distant nations only a day or two before he handled that precious pennyworth of news. Sitting snugly by his own fireside, and reacting, in however distant a degree, the parlour scene at Olney, he cons the sheet of print, on which, with such wondrous skill, enterprise, and intelligence, the “map of busy life” is brought before him. And when upon that map he meets with the name of Abyssinia, although he may know no more of its geographical position than did the cultivated gentleman mentioned by Mr. Lowe, and though he may never have heard of Rasselas, Father Lobo, Prester John, or even of Bruce the traveller, yet that printed sheet makes him acquainted, through its epitome and digest of news, with what Beke and Baker, Parkyns and Dufton, and others since them have told us concerning that remarkable country and its still more remarkable people. He reads of King Theodore and the captives, and the onward march of Britain’s army, and the footing thereby gained for planting among

those nations something more than the flag of conquest, and opening a way for Christian work and civilisation. But "the sound of war has lost its terrors ere it reaches" him; it "grieves, but alarms" him not; for there he is, safe at home, and only taking peeps through the loopholes of retreat at the far-distant arena of strife. Newspaper magic brings it all before him, and then, with a turn of its kaleidoscope, takes him from the din of war to the hum of peace, and gives him peeps at those other varying sights and scenes nearer home that contribute their individual items to constitute the "stir of the great Babel." He roams from Abyssinia to the English House of Parliament, to the record of "the grand debate, the popular harangue, the tart reply;" he wanders from the labyrinth in which he meets the Emperor of the French, the Pope, and Garibaldi, into those stiller scenes where Christian charity walks calmly on, scattering with a liberal hand gifts to the destitute poor at home, to the colliery widows and orphans, or, reaching across the sea, to the sufferers from the West-Indian hurricane. He travels on and "oft turns aside," now to election news and the enfranchisement of working men; now to Fenian murders and riots, or those outrages by London roughs, garotters and street wolves, that make Charles Lamb's "sweet security of streets" a thing of the Elian past. Now he turns to exposures of workhouse mismanagement; now, to a wail at the high prices of provision; now, to a full report of a cabinet minister's great speech on education; and then, before he has time to pause and reflect how the circles of knowledge are widening and spreading on the great lake of life, he suddenly stumbles on a paragraph headed by the word "Witchcraft."

Surely this must be a heading that is quite out of place, or inserted by mistake, or as a quotation. Alas! no. In the very newspaper which announced the resolutions to be moved by Lord John Russell on the education of the people—the great question of the day—there appeared a saddening narrative of the belief in witchcraft! The more notable was this strange narrative from its occurring in Shakespeare's town; and it was brought to light at the last Warwick Assizes.

It was so recently as the 9th of last November, 1867, that a man named John Davis, living in Stratford-upon-Avon, was committed to gaol to take his trial at the ensuing Warwick Assizes, because he carried out his belief in witchcraft. Day after day, not only he, but his wife and children—as, indeed, they one and all alleged—were tormented by evil spirits, who visited them in the sunlight as well as in the darkness, and tossed them to and fro in the air, and played with them such fantastic tricks as made them unable to sleep or to take a moment's ease. And so, in such an astounding state of things, it had dawned on such intellects as they possessed, that nothing could free them from the persecution of these spirits unless the charm was broken by drawing blood from the witch who had laid them under such spells. But who was the witch? who, but their near neighbour, Jane Ward. Whereupon John Davis lies in wait for her, springs upon her, and, while he holds her fast, takes his knife and inflicts upon her cheek "a frightful gash, full three inches long," which, as a matter of course, "draws blood." This is all that he requires. The "spell is broken," and both he and the various members of his family profess to be "relieved," and even tell that ruthless policeman, who pays them a visit on the morrow, that "they had all slept well and undisturbed, which they had not done while the witch was left unexorcised." But the Stratford-upon-Avon magistrates, not being framed in the Dog-

berry or Justice Shallow moulds, were unable to look upon the occurrence in this happy light, and sent John Davis to the county gaol, where he would have the leisure to ponder on the disadvantage of being behind his neighbours in the march of civilisation.

This leisure time has been extended to eighteen months with hard labour, the sentence accorded at the Warwick Assizes by the judge, who told the prisoner that, had it not been for his previous good character, he would most certainly have been sentenced to penal servitude. Another Warwickshire case of pretension to supernatural powers also came to light in December last, when an old fortune-teller, at the fashionable town of Leamington, was sent to gaol for a month with hard labour. Her "specialty," as the phrase goes, appears to have consisted in her assumed powers "to send sweethearts to young women," and her trade in this respect was so flourishing, that, according to local newspapers, "carriages might be seen waiting after night-fall in the vicinity of her dwelling." The same month of December, 1867, also, through the medium of the magistrates—who, evidently, were not as favourable to the witches as were Lord Bacon and Judge Hale—brought into public notice two decided cases of witchcraft, the one from Durham, where a Mrs. Briggs "drew blood" from a Mrs. Clark with a darning-needle, in order to break the charm of her bewitchment; and the other, in Devonshire, where a professional witch at Plymouth extorted £4 10s. from a stupid farm-labourer, who, when the dearly-bought charms had failed to cure his wife of her paralysis, went to a wizard, "a white witch," as he called him, who supplied him with further potent charms, at a further outlay of money. The Plymouth lady-witch has been passing her Christmas in gaol, and is even now there; for the magistrates sentenced her to three months imprisonment with hard labour.

But, though noteworthy, these cases do not stand alone. For this is an age in which thousands of respectable and (up to a certain point) educated persons can be found to believe in the oracular out-pourings of the retired naval lieutenant "Zadkiel," and his brethren of the craft, who assume the mystic names of Raphael, Orion, and Old Moore, and have dressed themselves in the tattered mantles of Agrippa, Paracelsus, Doctor Dee, Lilly, Cagliostro, Gadbury, Partridge, Poor Robin, Merlin, Mother Shipton, Nixon, Lamb, Forman, and the tribe of Rosicrucians, alchemists, and proprietors of magic crystals, show-stones, philosophers' stones, and elixirs of life. It is an age in which table-turning, spirit-rapping, horoscope-casting, fortune-telling, planet-ruling, and all sorts of conjuring flourish and abound, together with clairvoyants, mediums, Davenport Brothers, astrologers, genethliologists, predictors, and other purveyors of the *vox stellarum*, who, in spite of a cheap press and healthy literature, can boast of annually selling, in this country alone, one million of astrological almanacks published and issued amid the congenial fogs and mists of November.

Since, therefore, superstition and credulity are thus publicly fostered in so many shapes, we can hardly feel it a matter for wonder that they should here and there crop up in the rank growth of old-fashioned witchcraft. To a certain extent, indeed, modern witchcraft differs from that which was so luxuriantly fruitful in the middle ages, when the wizards pretended to raise spirits from whom they could extort the particular object which they or their clients coveted. But the time has gone by when noble and gentle ladies could openly, and as a matter of course, profess their belief in, and employment

of, witches and warlocks. Three centuries have passed since this was done by the Ladies Buccleugh, Fowles, and Kerr, the Countesses of Huntley, Athol, Angus, and Lothian, and many others, whose witcheries would now be esteemed of a very different nature; and the same distance of time divides us from that period when the punishment of death was first decreed to witches and those who were in league with them, and when the wretched victims of superstition were taken to the stake, there, as their dreadful sentence ran, "to be burned in ashes, quick, to the death."

Happily we live in a milder and more enlightened age; and although the spirit of credulity is not exorcised, yet we have freed ourselves from those grosser and more barbarous surroundings with which it was once evoked. Demonism has dwindled to divination, which, for the most part, is practised and believed in after a very stupid fashion. While mediums, spirit-rappers, magic crystals, and marvellous cabinets have been admitted, among other follies of the day, into west-end drawing-rooms, the witches and their witchcraft are doomed to rusticate among illiterate hinds. Except for specimens of that attractive class of humanity to which the name of "Lancashire witches" has been assigned, we must not now look for our witches and warlocks among the upper ten thousand of society, but we must search for them in country towns and sequestered villages, and there only among the homes of the poorest and least educated. In certain spots of social stagnation we may expect, here and there, to find people who, from superior cunning, have so twisted their ordinary lives as to appear, in the sight of their duller-minded neighbours, to be beings invested with supernatural powers; and, in such cases, these cunning people have probably traded upon the local credulity, and have voluntarily adopted the magical character of "wizard"—which is but another name for "wiseacre"—witch, or fortune-teller; and, for certain fees and rewards, are ready to divine dreams, discover stolen property, cure diseases in man and beast, and impose or remove charms. The month of August, 1863, produced at least two English specimens of the modern belief in witchcraft. There was the Somersetshire case of Ann Hogg, who, in order to obtain what she called "a blood cure," stuck a knife into the back of the reputed witch, and repeated the experiment on the body of the witch's daughter. And there was also the well-remembered Essex case, where "Dummy," the old and eccentric deaf-and-dumb Frenchman, was "swum" by the people of Sible Hedingham for being a wizard and refusing to take a charm from off the village publican's wife; when, being twice thrown into a mill-sludge and barbarously hustled by the mob, he received injuries which terminated, a month afterwards, in his death, and led to the two ringleaders of the mob being sentenced, at the Chelmsford Assizes, to six months imprisonment with hard labour. This was as true a case of "witchcraft" as, probably, ever occurred; for Dummy had, to all appearance, caused the woman's illness and kept her under the "spells" which he refused to take from her, spurning golden bribes and those malignant threats which were, unhappily, carried into execution. The ignorant woman was really bewitched by the fear that the supposed diabolical arts of the old French wizard were potent to produce the sickness into which her frenzied perturbation of mind soon threw her; and, to all intents and purposes, Dummy caused her illness by his self-assumed powers of witchcraft. The catastrophe of his own death was, doubtless, as unlooked-for as it was unintended by the ignorant mob who caused it, and to whom the swimming of a wizard would seem to be

the natural and pre-ordained way for the subjugation of his obstinacy. They thought that they should bring him to do what was required of him by making him a partaker in an experiment through which he would pass harmlessly; but however great the savage fun may have been to them, it proved to be nothing less than death to the supposed frog-eater and wizard.*

In the autumn of 1866, the credulity of the rustics of Bathampton, near Bath, was evidenced in their persistent belief that the ghost of their recently deceased pastor nightly walked in the village churchyard; nor could this ghost be duly laid until the county police had been summoned to perform the task; albeit, their harmless necromancy resulted in nothing more than the apprehension of—a large white owl. No sooner had this ghostly subject been settled in a common-sense, matter-of-fact way, than a case of witchcraft occurred in the little village of North Leverton, Nottinghamshire, where lived a farmer named Ellis, to whom two men, named Swallow and Bellamy, acted as horse-keepers. Something was amiss with the teams; and Bellamy not only accused Swallow of bewitching the horses but also threatened to bleed him for doing so, and, as a preparatory measure, beat him unmercifully over the head and face with his heavy whip-stock, in order to drive the witchcraft out of him. For this assault Bellamy was heavily fined by the Retford Bench, who declined to recognise his conduct as a vigorous effort to expel witchcraft; although Bellamy sought to justify his act by alleging that his fellow-servant had really bewitched the horses, and that he himself had tried to counteract the witchery by giving the horses dragon's blood and putting a charm in the corner of the stable. He produced two copies of the charm and a tin canister of the magical dragon's blood; the words of the former being these:—"Omnes Spiritus laudent Dominum Misericordiam habere Deus Desinetur Inimicus D. V." In parting from the magistrates, out of pocket but not out of heart, Bellamy delivered to them, as his *ultimatum*, the following decision:—"There's witching the same now as ever there was, only they durst not show it; and there's the same books as there always was;" the books referred to being the charm-books from which the fragment of blundered Latin had been copied "by a man at the railway-station," who had thus brought one of the greatest marvels of modern times into the closest juxtaposition with a degraded relic of mediæval superstition.

Perhaps a superstitious belief in witchcraft is not, at the present day, restricted to any special nooks and corners of our country, but may be as wide-spread as ignorance itself; for the instances here mentioned afford a clear proof that what we usually deem the developments of civilisation have only partially penetrated into rural districts; and that a combination of churches, schools, railways, and penny newspapers, is not yet sufficiently powerful everywhere to sink witchcraft to the bottom of oblivion.

MÜLLER'S ORPHANAGES.

The largest orphanage in England is at Ashley Down, Bristol. It contains eleven hundred and fifty children,

* In the parochial records of Rushock, Worcestershire, it is mentioned, under date of 1660, that "One Joan Bibb was tyed and thrown ynto a poole as a witch, to see whether she could swim. And she did bringe her Act'n ag't Mr. Shaw, the Parson, and recov'rd 10 lb. Damages and 10 lb. for costes." Here the witch had the best of it. But it was a very exceptional case; for while, if she sank and was drowned, she was considered to have thereby proved her innocence; if, on the contrary, she swam, she was usually tried for being a witch, and was burnt, stoned, or otherwise made end of.

and this number will soon be increased to two thousand. This remarkable institution has grown to its present proportions in about thirty years, and its vicissitudes during this period are well known to the readers of the "Leisure Hour." The founder of the orphanage is a

And, while this was going on, he often had not a shilling in the world for himself. For years the life of the young orphanage was a continual struggle, but all the while the orphans continued to increase in number, and, at last, Mr. Müller, seeing the advantage that would

(No. 2.)

ORPHAN HOUSES, ASHLEY DOWN, BRISTOL.

(No. 1.)

Prussian, named George Müller, a minister among the Brethren in Bristol. When he went to Bristol first, he stipulated with the congregation among whom he ministered that he should have no fixed salary—a very singular arrangement considering that he had no means of his own—and it was while he was in a condition of comparative poverty that he projected and commenced his orphanage. From that day to this he has never had a fixed salary, and he has never published any more than the initials of the donors who have supplied him with the means of carrying on the orphanage work. At first he took a few orphans into his own house, No. 6, Wilson Street, Bristol; and people in the neighbourhood, seeing that he was a poor man engaged in a humane work, began to help him; but, as he never had a regular list of subscribers, his means were very fluctuating, and occasionally the funds from which he supplied the orphans with food were completely exhausted. In this, its first stage, the institution was regarded as the work of an enthusiast, who would be sure to break down in the end; and certainly the straits into which he was driven seemed to justify the opinion. But, just as Mr. Müller ought, according to ordinary calculations, to have shut up his institution, he opened a second house, and took in more orphans, although there were no visible means of supporting them. Then he opened a third and a fourth.

arise from having a building properly constructed for the training of orphans, built a house to accommodate three hundred. This was followed by a second and a third still larger; and to these a fourth and a fifth have now been added, making a total accommodation for two thousand one hundred orphans. This work has cost over a quarter of a million sterling, every farthing of which has been supplied to Mr. Müller without solicitation; and the donations, which have varied from one penny to thousands of pounds in one sum, have never been published in connection with the names of the donors, so that there is no *éclat* to be obtained by giving. It will be seen from this that Mr. Müller is an extraordinary man, engaged in an extraordinary work. He has around him every day at the present time eleven hundred and fifty children, and these, as we have said, will very soon be increased to two thousand. Such an institution must be interesting not only to the philanthropist, but to all who are interested in the difficult question as to what is to be done with the destitute orphan poor.

Mr. Müller is a man of business and system, as well as of faith; and he would require to be systematic in the management of such a vast number of children. He opens each of his three great houses one afternoon in each week, and, taking advantage of this arrangement, we propose to have a peep at the orphanage as it is seen by a visitor.

The houses are called respectively Number One, Number Two, and Number Three—the order in which they were built. Number One contains boys and girls (300); Number Two contains girls only (400); and Number Three contains girls only (450). If we want to see

well-kept flower gardens. At the top of the hill we obtain extensive views over the county of Gloucester, and at no great distance we see the steam and hear the whistle of the locomotives on the South Wales Union Railway, which runs from Bristol to the Channel.

ORPHAN HOUSE, NUMBER THREE.

Number One—in which there are some special features, such as the bakery, which supplies the eleven hundred and fifty children with bread—we must go on Wednesday afternoon. If we want to see Number Two, which contains a nursery, with cots and cradles for the youngest infants, we must go on Tuesday. If we prefer to see the house most recently built, Number Three, we must go on Thursday. No exceptions are made to this order. The educational and other work is disturbed by the presence of the public, and, therefore, only one afternoon can be given up for their admission. If Croesus himself were to apply for admission on any other day he would be politely informed that “no exceptions are made;” and King Croesus need not stay to argue the matter, for no respect is paid to persons. So as this is Thursday afternoon, and as Number Three is open on Thursdays, let us take the legitimate opportunity of seeing this part of the home of the orphans.

At the top of Stoke's Croft, which verges on the old road from Bristol to Gloucester, there is a convenient cab-stand. We hail Jehu, and stepping into the cab we give the brief instruction—“Müller's—Number Three.” The next moment we are on our way to Ashley Down, for cabby, who has plenty of customers of the same sort, knows exactly where we want to be set down. After a drive of about a mile we ascend a rather long and steep hill, studded on either side with handsome villas and

Farther on we come in sight of the building we are about to visit—Number Three—and a very large and handsome stone building it is, without a single touch of eleemosynary repulsiveness about it. Number Three is on the right side of the road as we have approached it; on the left are Number One and Number Two; while a large scaffolding points out to us the sites of Number Four and Number Five, now nearly completed. We tell cabby to wait for us (he will have to wait rather more than an hour and a half, as it requires that time to walk through the building), and we ring the bell of the lodge. A pleasant-looking dame admits us and directs us to ring at the centre door. As we pass around the circular lawn we observe that the ground on our left is cultivated and has on it a good crop of potatoes; on the right are other kitchen herbs. We ring as directed, and a lady opens the door, and shows us up a fire-proof staircase to the waiting-room. Before we have arrived a large number of persons, on the same errand as ourselves, have set out with an attendant guide to look over the building, and we must wait a few minutes till a second party is made up. We soon find ourselves surrounded in the waiting-room by a number of people from different parts of the country. One lady has brought with her a large parcel of toys for the orphans, and another has brought presents to a particular orphan. The room we are sitting in is neatly carpeted and has a corniced

ceiling, and at one of the two large tables which are in the apartment there sits a lady who answers very affably such questions about the institution as the curiosity of visitors prompts them to put. We are just getting into a reverie on "individuality," as exemplified in the founder of this beautiful home for orphans, when the door is opened, and a young lady intimates that she will show us over the building. So in a crowd we follow her. There may be five-and-twenty of us, young ladies and ladies who are not young, gentlemen ditto, and two or three children. Five of our party are foreigners, among whom there is a stout gentleman who tells us confidentially that he is "one Frenchman," and has come from London to see the orphans. As our guide leads us, we note that she is dressed in a tastefully-cut black silk dress, with a gold buckle at her waist. There is no affectation of singularity in costume. Altogether she is a quiet, ladylike guide. Her daily life is, with that of many others, passed in ministering to the mental wants of all this fatherless and motherless community which she is now going to show to us.

The first room she takes us into is a dormitory for eighty girls. This room must be something like twenty feet in height, and you feel by the pure sweet air that its ventilation is well attended to. The bedsteads are neat iron ones, and they are covered by the snowiest of quilts. Passing through we come to the girls' wardrobe. Every article of apparel belonging to each orphan is numbered, and there is a corresponding number on the shelves in the wardrobe, so that there is no confusion. "How many dresses have the orphans each?" asks one of the ladies present, and our guide informs us they have five changes of dress, and if they do scrubbing work in the house they have six. She also tells us that they have three pairs of shoes each; and we think the provision as regards wearing apparel is liberal. Then we go on to a second dormitory containing fifty beds for one hundred girls, and this is followed by a wardrobe as before. In each case a teacher's bedroom overlooks the dormitories of the orphans. Then we pass on to a teacher's sitting-room, of which we afterwards see several very neatly furnished, with a few of the freshest of flowers on a table partially covered with books. The place, we begin to recognise, has an air of refinement, and the arrangements all point to health and comfort. Next we advance to smaller dormitories, first for twenty-four girls, then for twenty girls, and the latter has in it servants' boxes containing dresses, etc.; for these twenty are being prepared to be sent out to service. We advance again with our guide, and enter a dormitory for ninety girls, followed by the usual wardrobe, and then come to another for one hundred girls. We have not seen the orphans themselves yet, and as it is only three in the afternoon we do not expect to find them in the dormitories; but we wonder where they are, and as we do so there comes up through the open windows the sound of a vast number of young voices singing a cheery song, with a "tra-la-la" refrain. We advance to the window, and find that it looks out on one of the playgrounds—there are two playgrounds, one for each wing of the building—and that the children having joined hands form two vast circles, and are tripping round the centre swinging pole, to the merry music of their own voices. We listen to their "tra-la-la" for a short time, and then follow our guide down-stairs to the working and educational regions.

We find the schoolroom to be a large apartment hung round with maps and other educational appliances. The girls have been called in from the playground, where

they have been enjoying a short recess, and we find them at their work; for work and education alternate here. There is work at one part of the day, and school at another part, so as to give as much variety as possible. Some of the girls are making shirts for the boys, others are knitting, others are engaged on other useful articles of dress. The making and repairing of the wearing apparel for eleven hundred and fifty children is no light task, but it is all done within the buildings by the orphans themselves, who are aided by competent instructors. Before we leave this room, we look at the girls' copy-books, and see how the teacher and her multitude of pupils communicate with each other with the least disturbance to the general work.

Then we follow the orphans to a play-room, where they are put through a number of exercises, evidently founded on Ling's mild system. The orphans do this part of their work well and heartily. Then they sing us a few pieces, and after they are dismissed into the playground we look over their toys in the playroom. At the side of this apartment there is a long cupboard running the length of the room, with a large number of doors. Here the orphans keep their little treasures—all sorts of little fancy things that have been given to them, or that they have made themselves. One has a toy bed, another a pincushion in the shape of a boot, a little china doll about half the length of a person's little finger, with the satin dress standing straight out from the waist; another has photographs, a box of wooden bricks, etc. Here, in fact, there are as many toys as would set up a bazaar.

But we pass on with our guide, who takes us across the playground, fitted up with swings and springboards, and through the laundry into the washhouse. Here the elder orphans, with hired servants, are washing, ironing, and mangling. An American "ball" washing-machine is in operation, and the clothes are "wrung" by centripetal force in a machine which throws off the water in the course of its rapid revolutions. The best appliances for the saving of labour we note everywhere. Then we go on to the lavatory and bathroom—a large apartment with basins for washing on three sides, a large bath on the fourth side. A numbered bag containing combs and brushes, and a smaller bag containing a tooth-brush, hang over each basin. Next we come to the workroom for girls who are being prepared to go out to service, and you can here choose a servant, if you can satisfy Mr. Müller, who is very particular in selecting places for his orphans, that you are a person likely to give reasonable protection to a girl taken into your service from his institution. We next go on to the kitchen, where tea, which consists of a cup of milk and water and plenty of bread and butter, is being prepared. In this house there are 450 children to sit down, and the preparation of the meal is a matter of considerable labour. One fire, however, cooks the food for the whole of the orphans, and the same fire boils the four huge kettles for tea. From the kitchen we pass on to a second schoolroom, for we are in another wing of the building now, and we again see the orphans put through a variety of exercises. Then we go on to a second playroom with another bazaar of toys. From this we proceed to the storerooms and the cloakroom, the latter containing the winter cloaks of the orphans. We next enter the room in which the orphans are about to sit down to tea. There is a tablecloth on each table, and the elder orphans are preparing for the reception of the 450 who will shortly be here with good appetites. From this room we pass into a corridor in which we see the servants bringing forward from the

kitchen the supplies for tea, and then we take leave of our guide, and quit the building by the same door as we entered it, mentally acknowledging that we have seen a wonderful sight. Every one of the orphans we have seen was taken into the institution absolutely destitute, for no others are admitted; every one is well clothed, well educated for the position she is expected to fill; every one receives a liberal diet, and has her toys just as if she were at home. Nothing can possibly compensate for the loss of father and mother, and no "system" can make a real "home" for an orphan, in the sense in which home is understood by the children of well-to-do parents; but in the Orphan Houses at Ashley Down there is as near an approach to the domesticity of home life as it is possible to obtain in an institution in which there are a large number of children. Once a week the friends of the orphans may visit them, and the children are often taken out for a stroll into the country.

One peculiarity regarding these Ashley Down Orphan Houses is their expansiveness. Under the direction of their founder, George Müller, they have grown into their present dimensions; and, if they continue to expand as they have done, they must in the end include a large proportion of the destitute orphans in England.* In this aspect they assume a national importance, and make the question of orphanages exceedingly interesting. One great testimony to the efficiency of Mr. Müller's system is the healthfulness of orphans under his care. It is well known that, in foundling hospitals, the mortality caused by the separation of the child from the natural parent is enormous. The mortality in the Ashley Down Institution is exceedingly light. The rate of mortality in healthy towns is seventeen per year for every thousand. In many places this rate is greatly exceeded; but in some of the healthiest towns in England the rate is as low as thirteen. In Mr. Müller's institution the rate of mortality last year was only about ten per thousand, and this very low rate is remarkable, when it is remembered that a large number of orphans are the children of consumptive parents. This is very strong proof indeed that the system pursued at Ashley Down is in its physical results an admirable one, and well worthy of the attention of those philanthropists and humanitarians who interest themselves in the protection and training of the young in all kinds of benevolent institutions.

No influence or interest whatever is required to get a child into Müller's Orphanage. The only conditions are, that the child shall have been born in wedlock; that it is bereaved of both parents; and that it is in needy circumstances. When these conditions are fulfilled, the children are received in the order in which application is made for them, without any sectarian distinction whatever, and without partiality or favour. The annual cost of an orphan is about £12 8s., and the total amount Mr. Müller has received on behalf of his cosmopolitan institution is £259,089 0s. 11½d., an enormous sum, when it is remembered that not a penny has been asked for, and that the names of the donors are not made public. In all its aspects, the institution is extraordinary, and it is especially extraordinary as the work of a humble-minded foreigner who, thirty-six years ago, came to England a stranger, and who remains now, as he was then, a comparatively poor man.†

ABRAHAM LINCOLN.

II.

WHEN, at the age of twenty-three, Abraham Lincoln returned from the Black Hawk war, it was with new aspirations and resolutions. Henceforth he would bid farewell to the toils of the backwoodsman and a life of manual labour, and prepare himself, by reading and study, for taking a part in public affairs. What it was that had brought about this change in his purposes it is of course impossible to say. Whether, like a certain sage of an older time, he had seen "with how little wisdom the world is governed," and had discovered in himself some aptitude for the calling of a senator; or whether the accident of the war, which had brought him into contact with other aspiring and adventurous spirits, had aroused an ambition hitherto dormant in his breast, certain it is that from this time he marked out for himself a new course of life, and set himself to the attainment of objects far different from those which had hitherto engaged his attention. On returning home he suffered himself to be nominated as a candidate for representative in the State Legislature, the election of which was close at hand. He could not hope to be elected, as he was all but unknown beyond his own district; but he probably reckoned on the fact of his being a candidate securing him effectually at some future period. So thoroughly, however, was he appreciated in his own precinct, that of the whole two hundred and eighty-four votes given, all but seven were in his favour. This unequivocal testimony to his worth made him in a manner a political celebrity at once; and in future elections it became a point with candidates to seek to combine his strength on their behalf and secure his battalion of voters.

He now commenced the study of the law, with a determination to qualify himself for practice at the bar. He had no funds wherewith to support himself during the years it would take him to acquire the necessary knowledge; but he had gained some practical skill in land-surveying, and was fortunately enabled to turn that skill to good account. About this time it was that the mania set in, which proved eventually so ruinous to many, for speculation in Western lands; and although Lincoln had neither money nor inclination to embark in such a speculation himself, it was the means of furnishing him profitable employment with the chain and compass. The mania for new settlements spread like a contagion through the State; towns and cities without number were laid out in all directions, and innumerable fortunes were made in anticipation, by the purchase of imaginary properties whose value existed only in the brain of the projector. For nearly five years this delusion lasted, under the fostering care of the rogues who profited by it; and then came the crisis and crash of 1837, which tumbled the whole fabric into dust. But Lincoln had made good use of his time, and when his surveying was brought to an abrupt conclusion, the change served only to excite him to renewed energy in the prosecution of his law studies.

Meanwhile, during his practice as a surveyor, he was elected, in 1834, to the State Legislature, being the youngest member in the assembly, with one exception. His election, which was carried by a large majority, was solely due to character. He had as yet acquired no position—was known only for his straightforwardness and integrity, and in all other respects had his reputation to make. At this time he was very plain in his costume, and rather uncourtly in his address and general appearance. His dress was of homely Kentucky jean, and the

* There are about 12,000 orphans in the workhouses in the United Kingdom.

† Previous accounts of the Bristol Orphanages will be found in "The Leisure Hour" for January 1862, and in "The Sunday at Home" for July 1859.

impression made by his tall lank figure upon those who saw him for the first time was not very prepossessing. He had not outgrown his hard backwoods experience, or been able to lay aside the unpolished exterior of his earlier days; at the same time his deportment was frank and natural, without a trace of rusticity or awkwardness. During his first session he was for the most part a silent member, contenting himself with watching the proceedings, and thus gaining experience for the future. He manifested, however, an aptitude for business, and was appointed to the second place on the Committee on Public Accounts and Expenditure.

In 1836 Mr. Lincoln was elected for a second time as one of the representatives from Sangamon county; and again he was assigned a place on the Finance Committee. At the two sessions of this legislature, in 1836 and 1837, he spoke modestly, but to the purpose, in the interests of his party, and by degrees came forward more prominently in debate, and ere long became recognised as a leading man on the Whig side. When, in the winter of 1836-37, resolutions of an extreme Southern character were introduced, and, after discussion, adopted by the democratic party, Lincoln, who then little imagined that he was one day to be a chief instrument in the destruction of slavery on the American continent, refused to vote for the resolutions, and exercised his constitutional privilege, along with Daniel Stone, one of his colleagues from Sangamon county, of entering upon the Journal of the House his reasons for thus acting. The protest bears date March 3rd, 1837, and sets forth, among other things, that the undersigned "believe that the institution of slavery is founded on both injustice and bad policy." The sentiments of Lincoln on this subject, it need hardly be said, underwent little change or modification up to the time of his death.

In 1838 he was for the third time elected a representative in the legislature for the two years ensuing, one of his fellow representatives for Sangamon county being John Calhoun, subsequently notorious for his connection with the Lecompton Constitution. Mr. Lincoln's position was now so well recognised that his party would have voted him to the Speakership; but in the contest that ensued he was outvoted by the partisans of Colonel Ewing, who had been a comrade of Lincoln's in the Black Hawk war. Being now regarded as the champion of the popular cause, and especially as the advocate of all local improvements, he was repeatedly called on to oppose the measures of the democratic party, and almost invariably did so with success. This was the last time that Abraham Lincoln would consent to accept a seat in the State Legislature. First elected at the age of twenty-five, he had continued in office without interruption as long as he chose, and until, by his uniform courtesy and kindness of manner, his marked ability, and his straightforward integrity, he had won an enviable repute throughout the State, and was virtually, when but little past thirty, placed at the head of his party in Illinois. At the close of his career as a State legislator his fame as a close and convincing debater was established. His native talent as an orator had at once been demonstrated and disciplined. His zeal and earnestness in behalf of a party whose principles he believed to be right, had rallied strong troops of political friends about him, while his unfeigned modesty and his unpretending and simple bearing, in marked contrast with that of so many imperious leaders, had won him general and lasting esteem. He preferred no claim as a partisan, and showed no overweening anxiety to advance himself, but was always a disinterested and

generous co-worker with his colleagues, only ready to accept the post of honour and responsibility when it was clearly their will, and satisfactory to the people whose interests were involved. At the termination of this period, with scarcely any consciousness of the fact himself, and with no noisy demonstration or flashy ostentation in his behalf from his friends, he was really one of the foremost political men in the State; while those who knew him most intimately augured for him a far more brilliant future. We must now go back a little in point of time.

During the period of his service in the legislature, Mr. Lincoln was sedulously occupied in mastering the profession of the law. This he was compelled to do in a somewhat desultory manner, at such leisure as he could command, from the necessity he was under, as already stated, to support himself meanwhile by his own labour, to say nothing of the attention which the position he had accepted compelled him to pay to politics. Nothing, however, could prevent him from accomplishing his purpose. He completed his preliminary studies, and was licensed to practise in 1836. His reputation at this date was such, that he found a good amount of business, and began to rise to the front rank in his profession. He was a most effective jury-advocate, and manifested a sound judgment of the turning legal points of a case. His clear practical sense, and his skill in homely or humorous illustration, were notable traits in his arguments. The graces, and the cold artificialities of a polished rhetoric, he certainly had not; nor did he aim to acquire them. His style of expression and the cast of his thought were his own, having all the native force of a genuine originality.

An interesting story is told of one of Lincoln's first essays as an advocate in a criminal court. The only son of a man who had shown him much kindness in his youth was accused of murder. In the district where the crime was committed the prejudice was so strong against the unfortunate prisoner, that it was evident there could be no chance of a fair trial. Lincoln, without being applied to, came forward to defend the accused. He first obtained a change of venue, so that the trial might take place in another county. There he appeared as the prisoner's counsel; and having with much pains made himself master of the real facts of the case, together with evidence to substantiate the same, he was able not only to prove a strong animus on the part of the accuser against the accused, but to show that the former had wilfully borne false evidence from an evil spirit of revenge. The address to the jury on this occasion was characterised by signal eloquence and fervour, and the result was a speedy acquittal of the prisoner, whom the young lawyer had the happiness of restoring—his innocence of the charge completely established—to his widowed mother.

In the year 1837, having gained some repute in his profession, Mr. Lincoln took up his permanent residence at Springfield, the county seat of Sangamon county. For several years he lived the life of a bachelor, and was an inmate of the family of the Hon. William Butler, Treasurer of the State.

In November, 1842, Abraham Lincoln was married to Mary, second daughter of the Hon. Robert S. Todd, of Lexington, Kentucky. Four sons were the fruits of this union, one of whom died in his infancy. The other three, we believe, yet survive.

After his marriage Mr. Lincoln disappeared for a time from the stirring stage of political life, and, in the enjoyment of his domestic happiness, limited his energies to the active practice of his profession, in the pursuit of

which he met with a more than ordinary share of encouragement. His talents were, however, too useful to his party for them to suffer him to remain for an indefinite period in seclusion. He had always been a profound admirer of Henry Clay, and indeed had set that statesman before him as a model for imitation on his first entrance on the political arena. When, therefore, in May 1844, Clay was nominated by the party to which Lincoln was attached, as candidate for the presidency, and at the same time a democrat of ultra principles was put in nomination against him, Lincoln yielded to the demands of the Illinois Whigs, and accepted a leading position as canvasser in behalf of Clay, an office which, however it might prejudice a professional man in this country, never has any such effect in America, where the conditions of political antagonisms differ greatly from those attending the like contests among ourselves. He traversed various parts of the State, attracting large audiences and keeping their fixed attention for hours, as he held up to admiration the character and doctrines of Henry Clay, and contrasted them with those of his opponent. He had always a fund of anecdote and illustration with which to relieve his close logical disquisitions, and to elucidate and enforce his views in a manner intelligible as well as pleasing to his hearers. When he had done all that could be done in Illinois he crossed over to his former State, Indiana, where he was equally well known and appreciated, and, by exerting himself to the utmost, did all that was possible towards turning the tide of battle in Clay's favour. His eloquence and active enthusiasm were, however, in this instance, fated to be of no avail beyond the effect of placing his own reputation as a political orator on a still broader and more permanent foundation. Mr. Clay was defeated, contrary to the hopes and confident expectations of his friends, and much to the chagrin of the intelligent portion of the American people.

In 1846 Mr. Lincoln was elected by a large and unprecedented majority as member of Congress for the Sangamon district. He took his seat in the national House of Representatives on the 6th of December, 1847. Though comparatively a young man he was fully equal to the business of legislation, and at once took a part in the discussion of public matters, never missing a division, and voting on all leading national subjects as he knew Clay or Webster would have voted had they occupied his place. He objected strongly to the conduct of the war then raging in Mexico, and introduced a series of resolutions of inquiry in regard to the origin of the war, which in his opinion "had been unnecessarily and unconstitutionally begun by the President of the United States;" and his first speech—a speech remarkable for its uncompromising frankness and comprehensiveness of view—was on this subject.

The first session of this Congress was prolonged beyond the date of the Presidential nominations of 1848, and the canvas was actually carried on by members on the floor of the House. Mr. Lincoln sustained the nomination of General Taylor, and was equally bold and unsparing in the use of argument and ridicule, and humorous sarcasm, in setting before the people the real issues of the contest. We shall quote a paragraph from one of his speeches at this time, to show the way in which he could handle an opponent when he chose to return a Rowland for an Oliver, and also as a sample of his rough humour.

"I have introduced General Cass's accounts," he says, "to show the wonderful physical capacities of the man. They show that he not only did the labour of several men at the same time, but that he often did it at several

places many hundred miles apart at the same time. And at eating, too, his capacities are shown to be quite as wonderful. From October, 1821, to May 1822, he ate ten rations a day in Michigan, ten rations a day here in Washington, and near five dollars' worth a day besides, partly on the road between the two places. And then there is an important discovery in his example—the art of being paid for what one eats, instead of having to pay for it. Hereafter if any nice young man shall owe a bill which he cannot pay in any other way, he can just board it out. Mr. Speaker, we have all heard of the animal standing in doubt between two stacks of hay, and starving to death; the like of that would never happen to General Cass. Place the stacks a thousand miles apart, he would stand stock-still, midway between them, and eat them both at once; and the green grass along the line would be apt to suffer some too at the same time. By all means make him President, gentlemen. He will feed you bounteously—if—if there is anything left after he shall have helped himself."

At the close of the first session of this Congress, in August, Mr. Lincoln made a journey to New England, where he delivered some most telling speeches, and spent the remainder of the recess in the West, canvassing for Taylor with redoubled energy among the partisans of Cass, the opposing nominee. This time his unwearyed exertions were crowned with success, and he reaped, in the return of General Taylor over all odds against him, a compensation for the defeat of 1844. Returning to Washington in December, Mr. Lincoln resumed his seat in the House, sedulously attending to his public duties until the close of Congress in March 1849. At this date he finished his career as a Congressman, refusing to become a candidate for re-election. It does not appear that he desired or would have accepted any place at Washington among the many at the disposal of the incoming administration in whose behalf he had so zealously laboured. He retired once more to private life, renewing the professional practice which had been temporarily interrupted by his public employment. The duties of his responsible position had been discharged with assiduity, and with fearless adherence to his convictions of right under whatever circumstances. As to deriving any profit, either immediate or remote, from the services he was able to render to his party or his country—the idea seems never to have entered his mind.

AMONG THE LAPPS.

III.

HAMMERFEST is remarkable as being the most northerly town in Europe, its latitude being 70° 49'; but its surroundings are dreary, and not such as to detain the wanderer, for health or pleasure. It has a considerable trade with Spitzbergen, for which sloops of about thirty or forty tons are fitted out, manned by eight hands. The object of the voyage is the capture of white bears, walrus, reindeer, and eider-down nests. The cost of a vessel chartered for pleasure is about £50 a month. From this latitude the Aurora Borealis presents, at seasons, a magnificent spectacle—stretched across the sky like a rainbow of white light, then varying in form, now dipped in the colours of the bow, now broken into a golden shower, again shaped like an outspreading fan, or changing with weird-like mystery, as if the plaything of the spirits of the North.

The North Cape is about 91 miles from Hammerfest; but, apart from the fact that it is the North Cape,

presents little of interest in the way of scenery. The Cape is 935 feet high, and forms part of the island of Magerøe, a desolate moorland tract, all the romance of which must centre in the royal eagle or the free falcons. The sun is visible at the North Cape for about eight weeks, and at Hammerfest for about six weeks, day and night without intermission.*

Driven from Hammerfest by the aroma of oil, and discarding all phantasies of visiting Spitzbergen, we returned from the North in the same steamer. On our southward journey we stopped at Tromsø, to see the first ordination conducted by Bishop Gislesen, the new chief pastor of this the most northerly of the five dioceses of Norway, who had been our fellow-traveller in our passage northward. The church was crowded, and the ceremony interesting. The Bishop preached a most appropriate sermon, full of the distinctive doctrines of vital Christianity. He was a man of an excellent spirit, with a calm depth of religious feeling, and anxious for the welfare of his diocese. I had much pleasant intercourse with himself and his wife, who was known in Norwegian circles as the translator of several works, and the authoress of some religious poems. On parting with them, he wrote in my Norwegian Testament the text Gal. iii. 28, "In Memoriam Knud Gislesen, Bishop of Tromsø. June 25, 1856." Beneath is the autograph of his wife, "Henriette Gislesen," who gave me a small marker, composed of flowers, with the writing, "In die Bibel zu legen bei Joh. xiv. 27." When in Norway in 1864, it was with sincere regret that I heard they were both dead; their memories are much respected.

It was the 9th of July, 1856, when we reached Kaaffjord, the station for Bossekop, where are the copper works, now under English management; and the river Alten, famous for its splendid salmon fishing. We parted with many of our passengers, who had been to Hammerfest to record their votes; but in their stead we received fresh accessions. After we had left the fjord, I rambled about the ship, and was surprised at beholding some strange figures who had lately come on board huddled together in the bows. They seemed to be short in stature, with an oblique cast of eye, a square-built face, with low forehead, and something of the look of the Bushmen, or Root-diggers of the Pampas. They were curiously clad in skins, which I recognised as those of the reindeer. But one feature could not escape notice: not only had each one his feet chained together, but round the necks of several were large heavy iron collars, firmly riveted, so that it was impossible for the wearer to divest himself of his load at any time. The groups attracted my attention; I pronounced them to be Lapps; and, as they had been sent on board at Kaaffjord, I conjectured that they might possibly be some of the very men who had taken part in the riot at Kauto Keino in 1852. On inquiry from Mr. Vosslef, my conjecture proved to be correct, and they became a source of increased interest. There was one man among them who arrested our attention: the very expression of his face was stubbornness and unhumiliated self-will; he sat crouching with his knees together, and his head leaning on them, careless of being the observed of many observers. A vacant look of blighted hopes, withal, was visible in his expression, though his neck was iron and his brow brass. This man's name was Aslak; and, during the four years which had passed since the outbreak, he had never shown the least sign of contrition or remorse. It was difficult to hold any conversation with these people, as their *patois* would be almost unintelligible to a Norwegian. I endeavoured,

however, to establish communication with them by the help of Mr. Vosslef, who did not leave the steamer until Gildeskal.

Strange that he who had been once their victim should meet them in this casual manner four years afterwards under such altered circumstances. Having borrowed a Finnish Testament, I went near them and read, first, that exquisite passage in the third chapter of St. John's Gospel: "As Moses lifted up the serpent in the wilderness, even so must the Son of man be lifted up, that whosoever believeth in him should not perish, but have everlasting life." It was no slight privilege to rehearse these words of eternal life in the ears of these degraded outlaws, whom human justice had sentenced to bonds and imprisonment during the term of their natural life. After this I read the three last verses of the first chapter of St. John's first Epistle, and a portion of the third chapter of the Ephesians. It was very difficult to extract much from them, owing to their dialect, and not being myself a fluent scholar in Norsk. I gathered, however, that all, except the one named above, were penitent, and regretted their past conduct. These unhappy men were now being taken far from Arctic regions, hundreds of miles away to Christiania, the capital, to finish, it might be, their lives, in the sweat of their brows and amid the clank of chains. And yet even these, notwithstanding their degeneracy and low rank in the scale of society, had had glowing memories in earlier life. Some of these men were husbands, some were fathers, and surely their hearts had some time beaten with a quicker throb to the inspiration of such ties.

In order to see the effect of kindness—that key which unlocks the human heart—I went to the steward and ordered some coffee for these poor creatures; and it did one's heart good to behold their pleasure and gratitude. They lay there huddled together for the five days of our voyage, until we reached Drontheim, without comfort or shelter, their only pleasure arising from the gift of some tobacco from some stray passenger. As the steamer remained two days at Drontheim, we were obliged to disembark; but on our return we found our unfortunate Lappish fellow-travellers still on board. Their next destination would be Bergen, where they would change steamers, in order to round the Naze, *en route* for Christiania.

It appeared strange that in our wanderings three years previously we should have met Mr. Vosslef in the Sogne Fjord; then that we should have encountered his brother, the sufferer in the tragedy of '52; and, further, that we should have accidentally selected the very steamer for our return, which gave us as fellow-passengers the very actors themselves. But we are nearing Aalesund, where we are to disembark. Before leaving I went to the bows of the steamer to bid them farewell, and before long the smoke in the dim distance announced to us their southerly course for their distant destination.

Although, as we have already stated, the generality of Lapps in Norway profess the Lutheran religion, attend "preaching" as opportunity offers, and have their children baptized, yet no doubt many vestiges of pagan manners and superstitions would be found if their interior life were better known. They appear formerly to have worshipped a deity under the name of *Iremala*, who was probably the same as Thor, or Stourra Passe, who was represented under the figure of a stone. The latter was a familiar household deity, every family having some stone with a supposed resemblance to a human being, which they worshipped. The stone,

* A paper on the "Midnight Sun," by the author of these articles, appeared in the "Sunday at Home" for June, 1864.

which was usually a large one, was placed upon a pile of reindeer horns, while around the centre one were others of various sizes, which were honoured as the wife and children or servants of the presiding deity, according to their scale of magnitude. A Frenchman, by name Regnard, who travelled in Lapland in 1681, mentions having seen stones like these, which he declares were secretly worshipped by the Lapps, although they were nominally Christians. In their rites a sacred drum figured largely, which, as they had no official priesthood, might be inquired of by any private worshipper. This drum was made of the hollow trunk of a pine or birch tree, and was covered with skins. A variety of brass rings were placed on the drum, which was beaten with a hammer made of the horn of a reindeer; and, according to their movement to the left or the right, and their ultimate position, were the responses of the oracle favourable or the reverse. Divine honours were likewise paid to the sun, as in Persia and Peru; to the souls of the dead; and to aerial spirits, called *Irchles*, for whom they provided refreshments in baskets hung upon branches of trees. When a man died, they used, like the ancient Danes and Saxons, to bury his hatchet and warlike instruments with him—a practice common to many of the heathen nations of the world. The records of every unenlightened nation are the same: though varying in customs and superstitions, yet a monotony of folly, inconsistency, and ignorance stamps them all as the product of fallen human nature; which, though in its fears craving for something to worship, cannot, nevertheless, without revelation, rise to the conception of a pure, holy, and reasonable object of worship.

Original Fables.

BY MRS. PROSSER.

THE OLD BEE'S HINT.

"WHAT! on a *dandelion*!" exclaimed a young Bee to an old one, in surprise and contempt.

"Why not?" said the old Bee; "do you suppose honey is to be found only in roses? If you do, learn this: honey is honey wherever it comes from, and there's no flower so humble but a little painstaking may get some out of it. I am not ashamed to confess that I have made a more profitable visit to this homely dandelion than I have idly done to many a splendid exotic. Besides, more depends on the way we use our opportunities than on the opportunities themselves."

UNDERSTANDING A HINT.

"It's time to go," said the Swallows to the Starlings.

"Why?" said the Starlings; "winter is not come yet."

"No," said the Swallows, "not *come* exactly; but there have been chilling winds and gloomy skies frequent of late, and we prefer leaving with this gentle hint, to being *starved* or *stormed out*."

WHERE IT COMES SHARP.

"WELL! that is surprising!" said a young Jackal to his mother. "I have seen the hunters rattle balls from their rifles against that elephant, and they fell from his tough hide like hailstones; and those flies have actually made him caper about quite in a fury!"

"Ah, son!" replied the old Jackal, "the secret is, that the flies have found out where his skin is thin; most of us have a tender spot somewhere; and even an elephant, *when that is touched*, feels the bite of a contemptible fly more than he would the stoutest rifle where he is invulnerable."

NOT ALWAYS FLATTERING TO BE "LET ALONE."

"They never shoot *us*," said an old Crow to a Partridge, that after a flight of terror from a murderous gun had escaped to a quiet spot where some crows were feeding. She did not

answer, but cowered beneath the long grass, still panting with alarm.

"I say," said the old Crow, sidling up to her, "they never attempt to shoot *us*."

"Don't they?" said the Partridge.

"No; I can't think why. We are very handsome, and very useful, and highly respectable. I can't think why they let us alone, and are so fond of shooting you," said the old Crow, with an inquisitive look.

"Ah—I didn't know there was any difficulty about it. Are you not *carrión*?" said the Partridge.

"Caw, caw!" said the old Crow, "that didn't strike me!"

UNDER A SLIGHT MISTAKE.

"WELL! there's a great deal in knowing one's self," said Grim the yard-dog to a poor half-starved Cur that ran in and out by sufferance and picked up a bit or a bone as he could.

"Oh, yes, sir, I quite agree with you; only sometimes, as in my case, there's nothing worth knowing," said the Cur.

"Self-knowledge," observed Grim, "saves us from conceit. It is quite sad to observe the mistakes people make through ignorance."

"Well, there's a great advantage that way in being poor; for nobody flatters the poor, so they are in less danger of being conceited," remarked the hungry Cur.

"True," replied Grim; "but there's Mopsy—did you ever notice her? She is so self-satisfied, so full of admiration of her charms, she can hardly walk."

"Ah, she is very pretty indeed; I suppose her head is a little turned. Now there, you, sir, see the advantage of being ugly, for the ugly, like the poor, have no flatterers. So we—"

"We!—ugly! What do you mean by your impudence!" said Grim, showing his teeth. "I should hope I am as handsome as she is any day, only my beauty is of a different kind."

"Ah, yes, to be sure, sir—I hope no offence—only hers is a more common sort of beauty that strikes everybody, you see," said the Cur, in a fright.

"True; mine, I admit, is more refined, severe, and classical—greatly, you see, to be preferred to hers."

"Oh, no doubt, sir," said the Cur, much relieved to see the turn things had taken, for he had been afraid of entire banishment from the yard.

"And yet," continued Grim, "I never strut, nor assume airs. No! Aware of what I am, I am satisfied with the silent homage that I am sure I *must* receive from all competent judges; and were I to be petted and praised to the full as much as Mopsy, I should not be lifted a hair'sbreadth in my own esteem, so thoroughly do I know myself."

"Ah, self-knowledge is a fine thing indeed!" cried the Cur, "and I'm quite convinced by what your worship has said, that it's a very wise dog indeed that arrives at it. As for my poor self, I shall henceforth make sure of nothing concerning the subject, but that I am nearly always hungry—a fact that admits of no mistake."

THE DISCONTENTED CROW AND HER WISE NEIGHBOUR.

"Oh, dear! how tired I am," said a Crow, as she rested from building, and rocked gently backwards and forwards on the tree-top beside a neighbour.

"Don't you wish," she said again, "don't you wish you were a raven? Great and strong he is; never can feel tired as we do, I'm sure."

"I don't want to be a raven, though," replied her neighbour; "the sound of his voice frightens folks terribly; I shouldn't like to be feared and shunned."

"Well, no—that's true; but I should like at least to be a *rook*: they are so aristocratic. Wouldn't you rather be a rook? we are very vulgar in comparison, you must own."

"Rooks?" answered the neighbour; "rooks get shot and put into pies. No; I'd rather be a vulgar live crow than a genteel baked rook."

"I forgot that," said the Crow; "but I really *should* like to be a magpie; they are so handsome and so swift of flight."

"Should you?" said the neighbour; "I wouldn't be branded as a thief and a busybody, the very tip-top of all mischief, as *she* is, to be ten times as handsome. Why, the folks go about destroying her nest wherever they find it, because she is so good for nothing."

"Certainly, certainly; I agree with you her nest is never safe; but as to that, neither are ours. A storm comes, and

then where are we? The jackdaws are the best off. Nobody disturbs them, the wind cannot reach them, and their nests never want repairing. Oh, I wish I were a jackdaw, don't you?"

"What!" cried the neighbour, weary of her complainings; "would you like to spend all your life in the gloom of the old church tower, gliding in and out of a hole all day long, instead of rocking about in the breeze on this glorious green tree? Not I! Ravens and rooks, and pies and daws, are heartily welcome to all their advantages. I envy none of them; but, taking the bad and good together, am quite satisfied that no lot can beat the lot of a crow."

SOFT WORDS AND HARD DEEDS NOT PLAIN TO RECONCILE.

"I HOPE I don't disturb you, ladies and gentlemen," said a powerful young Horse, galloping at the top of his speed through the meadow, and scaring all the sheep into a corner.

"I hope I don't disturb you, friends," he cried again, as he coursed all round, and hunted them from their rest in his wild pastime.

"I trust I don't disturb you, dears," he shouted, as he sent them flying a third time from the terrors of his reckless racing.

"What does he mean by his 'hopes,' and his 'trusts,' and his 'friends,' and his 'dears?'" said an old sheep, when they had huddled together in the ditch to be safe out of his way; "he might content himself with frightening us out of our wits without insulting us with his impertinent falsehoods."

NOTHING TOO BAD FOR A TRAITOR.

"WHAT'S up now?" said Bolt, the poacher's dog, to Snatch, his companion.

"Why, it looks as if—yes, *positively* they are! Bolt, would you believe it? they are going to hang Drover."

"What! the shepherd's dog?" asked Bolt, running to the top of the bank to see.

"Ay, to be sure. Well, well, and all he did was to worry a lamb or two; if that isn't a shame!" said Snatch.

"A shame? No shame at all; he richly deserves it," said Bolt.

"Ahem," said Snatch; "I should like to know how long your neck and mine would be if they had been stretched every time we had made free with a lamb?"

"We! we are thieves, known, professed thieves, and if we allow ourselves to be caught, let them hang us: it's all fair that they should; but wasn't that fellow put over the flock to preserve it from us and all other enemies? Wasn't he trusted, fed, housed, and honoured as a faithful servant and friend? I say hanging is too good for him; he ought to be shot first and hung afterwards."

NOT ALWAYS FAIR TO JUDGE OF OTHERS BY OURSELVES.

Nobody could think what made Mr. Pug, the new pet's, nose so black.

"I know what it is," said Miss Floss, the lapdog; "he's been upsetting the ink, that's it"—a severe beating for doing the same in her lady's boudoir being fresh in her memory.

"No, miss, it's not that; he's been routing among the pots," said the turnspit, who often got a kick and a cuff from cook for meddling with her affairs in that way.

"You're wrong, both of you," said Grumps, the old house-dog, who was renowned for his surliness; "it's his bad tempers—they've all settled in his face; bad tempers always make black looks!"

ABUSE OF PRIVILEGE.

"Don't cut me down! Consider how old I am," said the Tree to the Woodman, who stood to deliberate, and replied—

"Old? well *that* you are, but are you sound?"

"Sound? there's not a bit of good timber in me, and hasn't been for years. I'm little else but touchwood," said the Tree.

"Well, but I suppose you will put out leaves to look pleasant in the summer?" said the Woodman.

"Leaves! alas no leaves have I put forth for many summers," cried the Tree, "I am so *very* old!"

"Is that it? then down with you. It's plain, if there's no hope of getting use or ornament from you, you ought to give place to others; you've been on the ground long enough."

Varieties.

THE POPE'S CURSE.—The Archbishop of Paris, in a recent speech in the French Senate on the Roman question, observed that if the Pope was obliged to quit Rome and wander through the world as a pilgrim, "the earth would tremble beneath his footsteps, and his words would be maledictions." In plain English, if turned out of Rome, the Pope would go about the world cursing! The following is the substance of "the Pope's dreadful curse, as being the form of excommunication of the Church of Rome." We quote it as given by Dr. Keith (from Harleian MSS., vol. viii. pp. 553-5), in his "History and Destiny of the Church and the World." "By the authority of God Almighty, the Father, the Son, and the Holy Ghost, and of the holy canons, and of the undefiled Virgin Mary, the mother and patroness of our Saviour, and of all the celestial virtues, angels, archangels, thrones, dominions, powers, cherubim and seraphim, etc., we excommunicate and anathematise him or them; and from the thresholds of the holy Church of God Almighty we sequester them, that he or they may be tormented, disposed, and delivered over with Dathan and Abiram, and with those who say unto the Lord, 'By the authority of us, we know not thy ways.' And, as fire is quenched with water, so let the light of him or them, for evermore, unless it shall repent him or them, and they make satisfaction. Amen. May the Father, who created man, curse him or them. . . . May all the angels and archangels, principalities and powers, curse him or them. . . . May the heavens and earth, and all holy things remaining therein, curse him or them. May he or they be cursed, wherever he or they may be; whether in the house, or in the field, or in the highway, or in the path, or in the wood, or in the water, or in the church. May he or they be cursed in living, in dying, in eating, in drinking, etc.; in the faculties of their body—inwardly and outwardly—in their brain—their head—their nostrils—their heart—their veins. . . . May he or they be cursed in all their joints, from the top of the head to the sole of the foot. . . . May the Son of the living God, with all the glory of his majesty, curse him or them; and may heaven, with all the powers which move therein, rise up against him or them, to damn him or them, unless it shall repent him or them, or that he or they shall make satisfaction. Amen." Dr. Keith quotes this Pope's curse in illustration of that trait in the prophetic character of the pretended vicar of Christ, when it is said (Rev. xiii. 11-18), "He had two horns like a lamb, and he spake as a dragon."

THE SERJEANT-SURGEONCY TO THE QUEEN.—The appointment of serjeant-surgeon is one of great antiquity. One of the duties is to be in attendance on the king when he ventures to battle, and the earliest record of this appears when John of Arden, in 1349, accompanied Edward III to the Battle of Crecy. The office of serjeant-surgeon was not, however, confirmed until 1461, when William Hobbys was appointed, with a salary of forty marks yearly. There were several perquisites attached, such as drawing a certain amount of wine from the king's cellars, the right to all the fine linen stained with the royal blood, and, during war, to take prisoners, retaining the amount of ransom paid for them. The surgeon to the sovereign was, moreover, the twelfth person in rank, and took precedence accordingly. Abroad the surgeons filling this appointment were treated with distinguished consideration, as, on the death of the sovereign, they were beheaded and buried with that potentate. Thus it appears that Austrigilda, wife of Gontram, King of Burgundy, had, in compliance with her dying request, her two physicians slain and buried with her. The chronicler adds that these were probably the only two medical gentlemen ever privileged to lie in the tombs of kings.

THE ISLE OF DOGS.—This island, formerly a waste swamp, has for many years been the scene of busy manufacturing industry. Here, in the various departments of iron-ship-building, are congregated several thousands of the most skilled and intelligent artisans and labourers. The terrible distress prevailing this winter in the east of London is sorely felt in the Isle of Dogs. An impression has gone abroad that much of this distress has been the result of trades union agencies. Knowing the facts of the case, we can affirm that this is a mistake, no strike having taken place for years. The men, with proper independent feelings, shrink from mere charity, but are appealing to the public to help them to employment to support themselves and their families, even at greatly reduced wages. In the true spirit of co-operation they are willing to give their labour at rates enabling Thames ship builders to compete with those on the Tyne, Wear or Clyde.

LIFE OR DEATH?

THE MORTONS OF MORTON HALL.

CHAPTER XIV.—THE LADIES VISIT THE INVALID AT CLIFF COTTAGE.

Miss WARDOUR and Mary Talbot visited Mr. Aston, agreeably to the rector's promise.

The invalid was seated at the parlour-window when the two young ladies entered the garden gate, and as they advanced up the gravel-walk he obtained a full view of Mary Talbot's features, and felt satisfied that she was indeed his sister's child.

He had anticipated the visit, and he held in his hand

a miniature portrait which he had taken from the pocket-book saved from the wreck.

"The likeness is perfect," he said to himself. "I could fancy that I saw my sister before me. There *can* be no mistake."

It cost him a great effort to conceal his agitation, and he had hardly time to replace the miniature in his pocket-book, ere the ladies were announced by the servant. When, however, they entered the parlour, he had so far recovered the control of his features that the emotion he betrayed when he met them might have been reasonably attributed to the effects of his recent illness.

"Mr. Aston," said Miss Wardour, coming cheerfully forward and offering her hand to the invalid, "let me introduce to you Miss Mary Talbot. My uncle, I understand, has spoken to you of the young lady; therefore I need say no more, but leave you to make each other's acquaintance."

"I am very happy to make the acquaintance of Miss Talbot," replied the invalid; but despite his efforts to appear at ease, his voice trembled as he spoke, and when he grasped Mary's hand in his own, he gazed so earnestly into her face that she blushed, and turned away her head.

Miss Wardour, however, thought the invalid's unwonted agitation of voice and manner was caused by weakness, and observed feelingly—

"I am truly sorry to find you looking so ill, Mr. Aston; still I hope you are improving rapidly, and that we shall soon see you at the Rectory again?"

"I am recovering as fast as Doctor Pendriggen will let me," replied the invalid, assuming an aspect of cheerfulness; "but when once an unfortunate being finds himself under the doctor's hands, there's no knowing when he will be permitted to escape from the thrall. I've learnt that much to my cost since I've been in England. Now, however, that you young ladies have once broken the ice, I hope you will visit me frequently, and I am sure your visits will do me vastly more good than all the medicines in the Pharmacopœia."

"A very gallant speech," replied Miss Wardour; "but I'm afraid there's more flattery than truth in it."

"Not at all; I mean what I say. And moreover, I'm going to put your good nature to the test. The doctor won't permit me to read, and Mr. Sinclair assured me that you—both of you—would gratify me, and enable me to pass away pleasantly what will be otherwise long weary hours—by reading to me; I would add, and by playing, but I have no pianoforte in the cottage. Still I mean to get one from Falmouth. It was an oversight of yours, not to order a piano, Miss Wardour."

"Was it likely, Mr. Aston, that I should order a pianoforte without receiving especial directions to do so from you? How was I to know that you played, or even that you were fond of music?"

"I do not play. But you must think me a great flatterer indeed if you don't know whether I am fond of music, after the admiration you have heard me express of your execution at the piano when I was your guest at the Rectory. Besides, did you imagine that I never intended to invite ladies to my cottage?"

"And then I have a daughter, whom you may perhaps see some day, and she, I assure you, is quite a proficient in music, although she is a backwoods girl."

"However, the mistake is easily rectified. I'll send an order to Falmouth to-morrow, and then, when the instrument arrives, you and Miss Talbot must choose a place where to put it. Does Miss Talbot play?"

"Very much better than I do, Mr. Aston. I am really ashamed of my performance since I have listened to hers."

"I am glad to hear that the young lady plays music"—and as he spoke he glanced so approvingly at Mary, that she blushed deeply beneath his gaze. "If, however, she plays better than you, Miss Sinclair," he added, "she must play well indeed; for, though I am no musician myself, I am something of a critic in music."

"At all events you read admirably well, and so I hear does Miss Talbot. May I hope that you will soon give me an opportunity to judge of your merits in that rare accomplishment?"

"I am afraid that you are a severe critic in that as well as in other things," replied Miss Wardour.

"I've heard of your severe disapproval of poor Margery's readings. My uncle says you described it as something terrible, and—if I mistake not—he added that you intend putting the poor woman through a series of nursery readings, to commence with "Goody Two Shoes," and "Cinderella?"

Mr. Aston looked somewhat foolish, as both the young ladies laughed at the idea of the old servant reading "Goody Two Shoes" to her master. He, however, soon joined in the laugh.

"I wasn't aware that Mr. Sinclair heard me," he explained. "I did set Margery to read Shakespeare to me, which I acknowledge was very silly on my part, and I was still more silly to be angry because the poor woman failed; but you cannot conceive how weary I sometimes feel of this life of utter inactivity and confinement. However, the 'Goody Two Shoes' readings were, I assure you, Margery's own proposition—not mine."

After this sally on the part of Miss Wardour, and Mr. Aston's explanation, the whole party were more at their ease. The young ladies remained chatting cheerfully upon various topics for an hour, and when they took their departure they promised to call the next day and read to him if he felt inclined to listen.

During his conversation with his visitors, Mr. Aston had, as it were, carelessly put several questions to Mary Talbot, whose replies would have satisfied him that she was indeed the daughter of his sister Mary if he had still entertained any doubt that such was the case.

No doubt, however, existed in his mind, and when he was again alone he gave free scope to his feelings, which were embittered by the thought that he would never again see his sister in this world. He learnt from Mary that her brother was expected to visit St. David previous to his departure for America, and he resolved that he would keep his secret intact until he had seen the youth.

"When the boy is about to embark," he thought to himself, "I will furnish him with letters to his cousins, and others who may be able to serve him; for I will not oppose his going to America. Even if he soon return to England, the experience he will thus acquire will be of service to him in future; but before he sails I will reveal my relationship both to him and his sister. They shall learn, poor children, that they are not alone in the world, and that the day is not far distant when the oppressors of the orphan child shall find to their sorrow that though Heaven's justice appears sometimes to move slowly it never sleeps."

From that day Mr. Aston took great interest in Mary Talbot. He rapidly improved in health, and was soon able to walk abroad and visit the schools and the Rectory, though the internal injuries he had received at the time of the wreck necessitated great caution on his part, and above all, perfect freedom from excitement. These injuries, however, were not very serious, and Doctor Pendriggen was satisfied that with the exercise of due care on his own part he would in course of time perfectly recover his health. The only fear was lest in his utter carelessness of himself when he felt in tolerably good health, he might by over-exertion bring about a relapse.

As may be readily imagined, Mr. Aston was felt to be a great acquisition to a parish which contained so few residents above the labouring classes; for though a few of the farmers and master-fishermen were in easy pecuniary circumstances, the adult population were almost wholly uneducated. Few could do more than

read and write, and even the village school-mistresses, who were regarded by the simple villagers as marvels of scholarship, were only qualified to instruct the children in the commonest rudiments of education.

Even Doctor Pendriggen, with his peculiar theory respecting the impolicy of over-educating the labouring classes, had no cause to dread the effects of the education these two elderly dames were capable of imparting to the children under their charge.

Mary Talbot had experienced so much unexpected kindness since she had come among her new friends, that Mr. Aston's evident partiality towards her did not surprise her as it might have done otherwise. The day after her first visit to Cliff Cottage he ordered a piano-forte from Falmouth, and he made the possession of this instrument a pretext for frequent invitations to Miss Wardour and Mary to repeat their visits; and moreover, he never invited a party to dine or spend the evening at the cottage without including the young governess in the list of his invited guests.

Thus several weeks passed away, until at length Henry Talbot arrived on his long-promised visit to his sister before he should embark for America.

CHAPTER XV.—HENRY TALBOT'S VISIT TO ST. DAVID IS BROUGHT TO AN UNLOOKED-FOR CONCLUSION.

MR. ASTON had held frequent conversations with Mary respecting her brother's visit to America, and through his advice, imparted by Mary, Henry Talbot, who cared not to what particular portion of the United States he emigrated, was induced to alter his original intention of proceeding to New York, and to take passage instead to New Orleans, where Mr. Aston had influential friends to whom he promised to give the young man letters of introduction.

Henry Talbot's visit had, however, been so frequently unavoidably postponed, that when at length he arrived at St. David, but a few days remained to him ere he expected to be summoned back to London to join the ship on board of which he had taken passage.

Mary had previously engaged lodgings for her brother at the farmhouse where she herself resided, in order that he might be with her as much as possible during the period of his brief sojourn. She wished to render his visit as agreeable as possible, and to gratify her, Mr. Sinclair and his niece, and Dr. Pendriggen and Mr. Sharpe extended a cordial welcome to the young man. Of all Mary Talbot's friends, however, Mr. Aston attached himself to her brother in the kindest manner. He seemed, in fact, to take as much interest in the youth as he had previously taken in Mary herself, and hardly a day passed in which he and Henry did not walk together, either into the country or along the seashore, the elder leaning on the arm of the younger, and conversing with him respecting the distant land for which he was so soon to embark.

Mary, however, was not so happy in her brother's visit as she had expected to be. As day after day flew rapidly by she could not conceal from herself the fact that each passing day brought the hour nearer when she must part from the only relative whom she knew or cared for on earth—perhaps for ever in this world.

She was also troubled with other anxieties. As has been told, the money which the sale of the furniture at Rose Cottage had brought had been equally divided between the brother and sister; but while Mary had hitherto kept her portion intact, she was well aware that her brother's share had been almost wholly absorbed in the purchase of his outfit, the payment of his passage to New Orleans, and other expenses. Acting under

Mr. Aston's advice, Henry intended to proceed from New Orleans to the great western emporium of St. Louis, and Mary was perfectly well aware that the cost of the passage to New Orleans was greater than that to New York, and that her brother would likewise have to defray the expenses of a long inland river journey after his arrival on the American shore, in order to reach St. Louis.

She almost wished now that Henry, notwithstanding Mr. Aston's liberal promises, had adhered to his original intention, and taken passage for New York. She could not bear to think of his landing, a stranger and almost penniless, in a foreign land; and at length she spoke to him on the subject.

"Henry, dear," she said, "what will you do? how will you manage, landing in America, as you necessarily must, almost destitute of money?"

"I must do as others do, I suppose, Mary. I must do as many have done before me, and as many more will do after me—earn money as soon as possible," replied the young man gaily. "However," he added, "I shall not be absolutely without money. I shall have fifteen or twenty pounds in my pocket."

"Fifteen or twenty pounds, Henry! What is that?"

"Oh, I don't know *how* many dollars—nearly a hundred, I suspect: more than a great many emigrants land with, Mary. It's a capital plan to count in dollars, it has such a sound with it; though the French system of reckoning in francs is better still for those who, like myself, have not a great amount to reckon."

"Seriously, Henry," replied Mary, "you must accept the money that I have lying useless at the bank. I have asked you to do so before. Now this change—this going to New Orleans instead of to New York—renders your acceptance of the money imperative."

"Seriously, my dear Mary, I shall do nothing of the kind," returned Henry.

"Recollect," continued Mary, "the long journey you have before you after you reach New Orleans. Suppose you should fall sick? Suppose that, after all your hopeful anticipations, you should fail to procure immediate employment at St. Louis? A hundred accidents may happen. I wish, Henry, that you would not leave me at all; but if you will go away, the money I have laid by, which is really of no service to me, may be very necessary to you."

"No, Mary," replied Henry, "I cannot and will not accept your money. You may require it yourself; and suppose you *should* need it, what should I think of myself, knowing that I had left you penniless?"

"It is not likely that I shall need it, Henry," replied Mary. "You see how comfortably I am situated here. I have a sufficient salary, and kind friends, and even if those friends should fail me, I can find a home, and a friend in Mrs. Margaret."

Henry, however, persisted in declining his sister's generous offer. He was sanguine in his belief that he would be immediately successful in America; and, reduced in circumstances as he and his sister had become through the sad and untimely fate of their father, he had as yet no idea of the crushing poverty which makes people feel the real use—the absolute need of money. Even though he had known that he would be left really penniless in America, he could not yet have conceived any notion of the terrible distress to which he might be reduced.

"Mary," he said, "there is no knowing what may happen to either of us. I know that money is useful in America as well as here; and if I had a few hundred pounds to spare I should be very glad of it. But your

share of the money brought by the sale I will not touch. I have no doubt that I have enough for my needs; but whether or no, I will not take yours, so please not to ask me again. Promise me, for every time you urge me to do so you make me uncomfortable;" and at length Mary reluctantly gave the required promise, and the subject was not again alluded to by either of them.

But three days of Henry Talbot's visit remained to him, when one morning Mr. Aston called at the farmhouse and invited the young man to accompany him on a ramble along the sea shore.

"You will soon leave us," he said, "and I want to have a long talk with you, and to explain to you what I have done to forward your prospects when you reach America. We will then return together to Cliff Cottage, where perhaps Miss Talbot will rejoin us, when she has completed her duties for the day. I have something to explain which I think may be of interest to both of you."

To this proposition Mary gladly assented, and Mr. Aston and her brother went forth together.

As they passed through the village they met the postman, who handed Henry a letter.

"From the captain of the New Orleans packet-ship Amazon," said the young man, glancing at the post mark and the superscription. "I know its purport," he went on; "it is to summon me to meet the ship in London on Saturday. The captain promised me he would drop me a line. Well, unpleasant news will keep. I would gladly stay here another week for poor Mary's sake;" and with this he slipped the letter into his coat pocket, to be read on his return home.

Mr. Aston had by this time apparently perfectly recovered from his illness. Still he was cautioned by Dr. Pendrighen not to over-exert himself, nor to excite himself in any way whatever. This morning, however, he walked along the shore to a much greater distance than was usual with him; and, though he had told Henry that he had something particular to communicate to him, he continued to converse upon ordinary topics. He hesitated, however, from time to time, as if he had something on his mind of which he found it difficult to disburden himself.

Henry could not help remarking his companion's unusual nervousness. He fancied also that Mr. Aston leant more heavily than usual on his arm, and at length he hinted that he thought they had rambled far enough, and had better begin to turn their steps homewards.

Mr. Aston, however, replied that he was not at all fatigued, and continued his walk, leaning still more heavily upon the young man's arm, and sometimes, as Henry fancied, talking somewhat wildly.

The young man began to feel alarmed, when at length Mr. Aston said—

"I think I *will* rest a while. The sun has affected my head. I shall feel better after a short rest, and then we will return homeward. I think, after all, I will put off what I had to say to you until we meet Mary in the evening."

A smooth, dry rock, often used as a seat by ramblers along the shore, and by the fishermen when mending their nets, was not far distant. They walked towards it, and Mr. Aston seated himself upon it.

"I think I will now glance at my letter," said Henry, when his companion had seated himself, "though I can guess beforehand what are its contents."

As he spoke he drew the letter from his pocket, broke the seal, and had just glanced at the very brief

contents, when he was startled by a deep groan, and, turning quickly round, he saw that Mr. Aston had fainted, and was in the act of falling forward from the rock. The young man dropped the letter, and, springing towards his elder companion, was just in time to catch him in his arms, and probably to save him from injuring himself severely against the rough, sharp pebbles of the beach.

It was the first time he had ever seen any one in such a condition, for Mr. Aston was deathly pale, and totally unconscious; nevertheless, he loosened his neck-cloth and unbuttoned his coat and waistcoat, and then looked round in search of help.

A party of fishermen were busy drying their nets a short distance off, and Henry shouted and beckoned to them, until at length they heard him and came running to his assistance.

"Bring water, quick," cried the young man, and the fishermen, all of whom knew Mr. Aston by sight, promptly obeyed. Salt water was brought from the pools in the sand, and dashed into the fainting man's face, and various other rude means were employed to bring him back to life, without the slightest apparent success.

"Aw do b'lieve un be dead, puir genelman!" said one of the fishermen.

"What *is* to be done?" cried Henry, in an agony of alarm. "He must be carried home. A doctor must be sent for. He *can't* be dead! But just now he was talking with me, apparently quite well in health. Can *you* carry him home? I will pay you for your trouble?"

"Ay wull us, measter, an' i'thout pay too," cried two or three voices at the same moment; and some of the party went to their boats for oars and stretchers, while others took off their heavy pilot-coats, wherewith to form a couch.

While this was being done Henry saw the letter he had dropped lying on the pebbles at his feet. He stooped to pick it up, and in so doing glanced hurriedly at the yet unknown contents.

Then a new alarm came over him. He drew forth his watch, and saw that it was already eleven o'clock.

"What is to be done?" he exclaimed. "The mail-coach passes by the village at half-past twelve, and if I cannot take passage in it I shall be ruined!"

He addressed himself to the fishermen, in his alarm and bewilderment, as though they were acquainted with all his plans.

"I have taken passage on board ship for New Orleans," he continued. "The vessel *was* to have sailed on Thursday next, and I have just received a letter from the captain to acquaint me that she will sail positively on Wednesday. If I do not leave here by the mail to-day, I shall lose my passage-money and all my clothing and outfit. What on earth can I do?"

He addressed himself to men accustomed to, and prompt to meet emergencies.

"Thou mun be off, young measter," replied the oldest of the fishermen. "We'll carr' th' poor genelman whoam. Bless tha, *we* know's un well enow, an' thou'll mayhap do more good if tha goes whoam, an' sends for t' doctor to meet un, nor if tha stays here."

"Will you promise me to convey him quickly and carefully to Cliff Cottage?"

"Sure us wull, measter. What do tha tak' us for?" Henry took a guinea from his purse, one of the few coins that remained to him. "I don't know what else I *can* do," he said; "be careful—very careful. I may perhaps be of more service by preparing the servants

and sending for the doctor. I don't like to leave him, but I have no alternative. Take this, (he held forth the guinea); I would give you more if I could afford it, and I will hasten to the village and give the alarm before I go."

"Us doan't want thy money, measter," replied one of the men for his companions; "go tha away and send for doctor, an' we'll bring un whoam."

Henry cast a glance of deep concern and pity upon his kind friend. His heart smote him for leaving him in such a condition; but he really had no alternative save the ruin of all his hopes, and he thought, as the fishermen said, he might do more service by hastening home than by remaining.

He was turning away when he saw Jemmy Tapley, the old wooden-legged seaman, who has before been introduced to the readers of this history, approaching towards him.

Henry had already made the acquaintance of the old man, whom he knew to be a favourite of Mr. Aston's; he therefore hastened to meet him, and briefly explained what had occurred.

"I don't know these men, Tapley," he said to him. "They will be careful, I daresay; but I'm sure if I entrust him to *your* charge, you'll see that he is carried carefully. I may be of more service by hastening to give the alarm than by remaining here. At all events, I *must* go."

Jemmy Tapley readily promised to take charge of the sick gentleman, and see that he was carried carefully and quickly home; and, scarcely waiting to hear the old sailor's promise, Henry hastened away at the top of his speed, and soon reached the schoolhouse, where, as he expected, he found his sister.

Terrified at her brother's wild looks, Mary started up from her seat, and inquired in a faltering voice what had occurred to alarm him.

Henry briefly explained the circumstances of Mr. Aston's sudden and serious, if not fatal attack, and then, holding forth the letter, added—

"And I, Mary, have received a letter from Captain Dobson, of the Amazon. The vessel leaves the London Docks positively on Wednesday morning. I must leave St. David immediately and haste to London by the mail, which will pass by the village in less than an hour, or I shall miss the ship, forfeit my passage-money, and lose my whole outfit, which is already on board. I am very sorry. I hoped to have spent three more days with you; but there is no help for it. Then it seems so heartless, so unfeeling, to leave Mr. Aston, who has shown us both so much kindness, in his present condition, without waiting even to hear the result of the seizure. But what can I do? What *can* I do? You know that an hour's delay would blight all my hopes in the future."

For a few moments Mary stood pale and trembling. Mr. Aston's sudden attack of illness, and her brother's equally sudden and unexpected summons to return to London, both told to her in the same breath, shocked and bewildered her; but she presently recovered herself.

"You must go, Henry dear," she said, "if now, at the last moment, you will not listen to my request and remain in England. If you will do that, let your outfit go, forfeit your passage-money, and make use of the money I possess, lying idle in the bank."

Henry shook his head.

"It would be a cowardly act on my part to shrink—to slink away at the last moment. If Mr. Aston recover, which I hope he will do, he would be the first to

blame me; and once again, Mary, I repeat that I will not stoop so low as to rob *you* of your small store of money."

"Then you must lose no time, Henry. Much as I regret your sudden departure, I should do wrong to detain you a single moment. You have, of course, despatched a messenger to Dr. Pendriggen?"

"I have not. In my confusion I forgot to do so."

"Oh, Henry dear," replied Mary; and there was a slight tone of reproach in her voice. Then she continued—

"Go you to Dr. Pendriggen's house, Jane Harvey, and you too, Betsy Wilcox" (addressing two of the elder girls of the class). "Try which can be the swifter messenger. Tell the doctor that Mr. Aston has been seized with a fainting fit on the beach, and is being brought home by some of the fishermen. Hasten, girls, and tell the doctor to come at once, or—Stay, I will give you a note, Jane—you start off at once, Betsy."

She wrote in pencil on a slip of paper—

"Dr. Pendriggen,—Mr. Aston is seriously ill—perhaps dying. Come immediately to Cliff Cottage."

"MARY TALBOT."

This note she handed to her youthful pupil, and bade her hasten after Betsy. Another of the girls was sent with a message to the Rectory, and yet another to Mr. Sharpe. Then, again addressing her brother, Mary continued—"You have not a moment to lose, Henry. You had better go home and pack your trunk forthwith, and get Farmer Hobson to drive you to the end of the lane where the coach passes. I will excuse you to Mr. Aston. Write, if it be but a line, the moment you arrive in London, and write again by the pilot who will take the ship out of the river. I will write you a letter to-night and let you know how Mr. Aston is. And now, goodbye my dear brother, and may the blessing of Heaven attend and protect you. I will explain to Mr. Sinclair and the rest how you came to leave us so suddenly. Good bye, and never forget me, Henry. I shall think of *you* day and night, and never forget you when I kneel to pray."

Tears prevented further utterance. The brother and sister tenderly embraced each other, and parted, as they expected, for years—for ought they knew, for ever.

Henry Talbot hastened to his lodgings, hurriedly packed his portmanteau, and was driven to the end of the lane by Farmer Hobson. He just barely managed to catch the mail-stage, which always stopped to change horses at an inn about half a mile from the village, and the next minute was whirling rapidly away towards the great metropolis.

SPERM WHALE FISHING.

BY W. H. G. KINGSTON.

THE sperm whale is not confined to one part of the ocean, but wanders in search of its food much farther than the true or Greenland whale. It is found on both sides of the line in the Pacific; as far north as California, on the American coast, and off Japan on the west; among many of the numerous groups of islands scattered over that ocean, off Australia, and New Zealand; in the China Seas and Persian Gulf, and in the Atlantic; he not only crosses the line, but has occasionally been seen not far off the Chops of the British Channel.

He wanders into these various regions, not on account of a peculiarly roving disposition, but in search of his favourite food, a hideous animal of the cuttle-fish

kind, called by sailors the sea squid, and known to naturalists as the "Sepia Octopus," one of an interesting family of mollusca denominated Cephasopoda, or creatures with arms and feet growing out of their heads. Even the shark seems disposed to allow the whale the monopoly of this charming animal for food. Its head is armed with a sharp beak, and its long tentacula are terminated by claws with which it catches hold of its prey. It varies greatly in size. The arms of those commonly seen are from one to two feet long, but they have been found with tentacula six feet in length; and there is on record one which was discovered in the inside of a whale, with a tentaculum twenty-seven feet long. With these powerful arms the creature encircles its prey, and the natives of the South Sea Islands, who will boldly attack a shark with a knife in the water, have a dread of falling into its deadly embrace. The squid is, however, eaten by the inhabitants of many coasts, and among others by those of the Mediterranean, where, however, the sperm whale does not venture.

There is a species of the Sepia Octopus known as the rock squid, from its being able to move along over rocks out of the water, somewhat in spider fashion. A naturalist, on one occasion hunting for shells, had his arm grasped by one of these creatures, and it was not without difficulty that he prevented it from fixing its horned beak in his arm, nor could he get it off until it was cut away piece by piece with a knife.

Besides the squid, the sperm whale swallows certain fish of the size of a small cod. They and the squid are both attracted into his huge mouth, it is said, by a certain white glittering appearance in the lining.

Our readers need scarcely be reminded that the whale is, properly speaking, a sea animal or beast, and not a fish, for it produces its young and suckles them as do land animals, being viviparous and a mammifer.

The sperm whale is very unlike the Greenland whale. Its head, which constitutes about one-third of the length of the animal, has a thick blunt extremity called the snout, in shape not unlike the bottom of a black porter bottle. Immediately behind this huge head, or what may be called the shoulder, is a protuberance known as the bunch of the neck. This is the thickest part of the body, which from this point very gradually diminishes for about another third of the whole length, when the tail commences. Here also is a protuberance called the "hump," succeeded by lesser humps called the "ridge," half-way down the tail. The tail is known as the "small" by whalers; towards the end it is not thicker than the body of a man, and at the end it expands into a triangular fin something like the tail of a fish, six or eight feet in length, and from twelve to fourteen in width in a full-grown male. This formidable implement, called by whalers the "flukes," enables the creature to swim at a rapid rate, to dive, and even to leap out of the water, while one blow from it dashes the stoutest whale-boat to fragments.

The mouth extends nearly the whole length of the head. Both jaws, especially the lower, are contracted in front to a very narrow point, and serve the same purpose which a cutwater does to a ship. In the lower are forty-two large teeth, which fit into cases in the upper, which has none. The throat is large enough to admit the body of a man. The eyes, placed a little above and behind the angle of the mouth, are small, and furnished with eyelids. At a short distance behind them are the openings for the ears, large enough to admit a small quill. Not far behind the mouth are the fins, analogous to the arms of a man; they are less used by the animal for swimming, which is performed by the tail, than for

balancing, or diving, or supporting its young. They are about six feet long. It has but a single blowing-hole or nostril, placed in the upper and front angle of the head. In blowing, the jet of water is thrown upwards and forwards, spreading out like a stalked plume. In the head is a large triangular cavity called the "case," which contains often a ton, or more than ten large barrels, of spermaceti. This oily fluid, from its extreme lightness enables the animal to keep its vast head out of the water. Below the case is a thick elastic mass, infiltrated with oil and spermaceti, which also contributes to the lightness of the head.

The skin of the sperm whale is generally black, and immediately under it is an oily mass on the breast, about fourteen inches thick, and on other parts of the body eight to eleven inches thick. It is called by sailors the "blanket," an appropriate name, as it serves to protect the animal from the cold of the water as it approaches Antarctic regions, and also adds greatly to its buoyancy.

When cut off it is known as blubber, and furnishes the greater part of the oil for which the creature is killed. A full-sized sperm whale, such as has been described, is about eighty-four feet long, with a depth of body of twelve or fourteen feet, and a circumference, therefore, of thirty-six feet. The head is from eight to nine feet deep, and five to six wide. Such is a very brief description of the mighty Leviathan of the South Seas. He is also powerful in strength, and sagacious, and is believed to be capable of feelings of revenge against those who attack him.

Among the earliest captors of the sperm whale were settlers in what were then British colonies of North America. They pursued the animal when it appeared off their own coasts, in open boats, after a rude fashion learned from the native Indians. Their descendants have persevered in the occupation, and at the present day they send out more vessels to the South Seas, from Boston and other parts of the United States, than do all the other nations of the world put together.

About ninety-two years ago the first expeditions were fitted out for the capture of the sperm whale, from English ports, encouraged by high bounties. The principal resorts of the animal not being known, and the seamen probably not being very expert, no great success was achieved.

English vessels were, however, the first to follow the chase in the Pacific and off New Zealand and Japan, where they met with abundant success. The most enterprising merchant who engaged in the trade was Mr. Enderby, at the end of the last century, and his descendants have till within a few years continued to carry it on with great vigour. Their last enterprise was the formation of a whaling establishment on the Auckland Islands, granted by Government to their firm; but it was after a time, from various causes abandoned. At one time a number of South Sea whalers sailed from London, Liverpool, and other British ports, but at the present day there is not one engaged in the trade belonging to any English port. The reason of this is simple: they had to remain out two, three, and even four years, and often in a battered condition, to make the long voyage home. It was therefore found to answer better to fit out vessels at Sydney and other Australian and New Zealand ports in the very centre of the regions where the whales abound, and to bring home the oil in ordinary traders, sailed at a much less expense than are whalers. To those ports, therefore, the English trade has been completely transferred, though it is still pursued vigorously from Boston and other ports in the United States.

The vessels employed in the trade were and are of from three to four hundred tons, barge-rigged, with somewhat short yards, so as to be easily handled, wall-sided, and painted black. They carry six boats, long, narrow, and sharp at both ends, hoisted up three on either side, and about thirty-two men, including a surgeon. They are furnished with casks and huge cauldrons for boiling down the blubber, part of which serves for fuel.

The boats are fitted in a peculiar manner. At one end, looked upon as the stern, is an upright piece of wood called the logger-head, and at the other a groove through which the harpoon-line runs out. Each boat has two lines of 200 fathoms in length, coiled carefully away in their respective tubs. There are also four harpoons, three lances, a keg containing a lantern, tinder-box, and other small articles; the object of the lantern being to show a light in case of being benighted; three or four small flags, called whiffs, to be inserted in the dead whale, should the boats have to leave it in pursuit of another; and also some pieces of board called drougues, to be attached to the harpoon-line, in order to check the speed of the whale when running or sounding. Four of these boats are generally employed at a time, with six men in each, commanded by the captain and his mates, who steer the boats till the moment for attacking the whale arrives, when they change places with the headmen and act as harpooners.

Arrived on the ground the vessels are kept ready, with two men aloft on the look-out for whales. "There she spouts!" cries one of them. "There again!" pointing in the direction where he has seen the spout. In an instant all is activity. The boats are manned; away they go at full speed after the whale. Before they reach it the animal sounds, that is, dives beneath the surface. The experienced captain has marked where he went down, and, as the whale cannot remain under water beyond a certain time, looks anxiously for his re-appearance. Up the whale comes. Again the boats are in hot pursuit. The captain, who has been steering in the leading boat, springs to the bows, and seizing the harpoon darts it with all the force of his muscular arm into the animal's side. "Stern all!" he then cries; and high time it is to be out of the huge creature's reach, for he begins to lash with his tail, and turn and twist in every way, till the surrounding water is a mass of foam. Sometimes he darts off, with the boat dragging after him at a furious rate. At other times he sounds, and then, when the first line has nearly run out, the second is attached, and at times the other boats, coming up, their lines are also joined on, to such a depth does the whale sink. In this case, however, as well as from running, the whale soon exhausts himself, and the boats, dashing after him directly he appears, more lances are plunged into his side, and the death flurry soon comes on. A violent shudder passes through the vast frame, and the animal then begins to lash his tail and twist and struggle more furiously than before. Woe betide the boat and her crew within reach of those vast flukes at that moment. One blow from them would dash her to fragments, and send the men swimming for their lives. When sounding, a large whale has been known to take out 800 fathoms of line—that is, four lines; at other times, having upset one or more boats, he breaks away, with harpoons fixed in him, 200 fathoms of line, and a drougue or two on to it. In most instances he is overtaken by the other boats, and finally killed, when he turns over on his side.

It is very exciting when a "school" of whales are found, and perhaps each boat is fast to one of them or

again, when several rival whalers are together, and their boats are in chase of the same whale. The prize belongs in such cases to the boat which first is fast.

The whale being killed, the vessel sails up to him, or if there is a calm he is towed alongside. He is first hooked on through a hole cut near the head. The head is next cut off and secured, snout downwards, astern. Then, with ropes round their waists and armed with spades, they descend on the carcass and commence the operation of "cutting in." This is to cut with the spade a strip between two and three feet broad, in a spiral direction round the body of the whale. This strip, called the blanket-piece, or pieces, is hauled on deck by tackles from the main yard, worked by the capstan, and as the blanket-pieces ascend the body turns round and round until the whole is cut off to the flukes. The lean carcass is then cast loose to float away, and the fluid spermaceti is drawn up by a bucket out of the case, astern, and when that is done the junk is cut off and hoisted on board.

The next operation is that of "trying out," that is, boiling down the blanket-pieces and spermaceti. The cauldrons, or "try-pots," are fixed in their places on deck. The crisp membranous parts, after the oil is extracted, called "scraps," are employed as fuel. The valuable spermaceti from the head is boiled by itself, and of course kept in separate casks.

The operation of boiling down the blubber of a large whale, and stowing away the casks into which the oil is put, amounting to about eighty for each, occupies about three days. A whaler, while this business is going on at night, presents a wild and curious scene, the light of the flames falling on the smoke-begrimed countenances and figures of the men, as with brawny arms they handle their long forks to throw the blanket-pieces into the pots or to feed the fire with scraps. It has, as may be supposed, a repulsive appearance, though in reality the dirt produced is not so great as might be expected, nor does any disagreeable smell attend the operation.

Vessels have been known to return home with upwards of three hundred tons of oil, while others, after an absence of three years, have come back with a shattered hull and worn-out sails, not half full. No wonder, then, that, after the discontinuance of the bounty system, English merchants found more profitable ways for the investment of capital. The largest amount of sperm oil brought into the port of London in one year appears to have been about 8,000 tons. Still, Americans find it answer: the reason is, that the masters are part, if not entire, owners of the ships. They often take their wives and families with them, and make their ships their homes during the cruise; they have followed the calling from father to son; and, what is more, they have picked crews, who remain with them from voyage to voyage, and have an interest in the enterprise, each man, according to his rating, sharing in the profits.

Of late years fire-arms have been used to project harpoons, and it is believed that they answer their purpose, and prevent the necessity of boats approaching quite so close to the whales as was required with the common harpoon; and by this means the risk is somewhat lessened. The chase of the whale still remains, however, the most dangerous pursuit followed by the hardy sons of the ocean.

ABRAHAM LINCOLN.

III.

For the next five years after leaving Congress, Mr. Lincoln quietly pursued his profession of the law, taking

no part in politics during General Taylor's administration. His great political leader, Henry Clay, had resumed his place in the Senate, and was earnestly striving to avert the dangers to the country, which he believed to be threatened by the fierce contests over the

question; so much so indeed that he reduced the Douglas party in the state of Illinois to a hopeless minority.

Proud of his eloquent advocacy and uncompromising zeal, the people of Illinois, when called upon in 1855 to elect a United States senator, chose Mr. Lincoln. This

question of slavery. It was, with the slave States, a desperate struggle to retain the balance of power in the Senate by rejecting the application of another free State for admission, the granting of which would destroy the exact equilibrium then existing. The policy of admitting a slave State along with every new free one had substantially prevailed for years; but at this time, despite the extensive additions of Mexican territory, there was no counterbalancing slave State ready for admission. When California was admitted as a free State it was by compromise with the Southerners; and an agitation followed which threatened serious consequences, and which only subsided on the agreement, in 1852, of both parties to accept the compromise as a final settlement. Mr. Lincoln had no share in this settlement, though it is likely that, on the whole, he approved of it.

In 1854 came a shock to all opponents to the spread of slavery, which, like an alarm of "Fire!" in the night, startled them all into immediate action. This was the introduction of the Kansas-Nebraska bill—a bill to admit Nebraska and Kansas as slave-holding States, and which was the cause of the anarchy and bloodshed that prevailed in Kansas during the following year. Indignant at this gross violation of the most solemn pledges, Mr. Lincoln at once addressed himself to the task of opposing so great a wrong. He laid aside his profession, and, determining to do battle for the right, entered into the canvass of 1854, as one of the most active leaders of the anti-Nebraska movement. He addressed the people repeatedly with all his characteristic earnestness and energy. He met, and cowed, Judge Douglas, the author of the "Nebraska Iniquity," in the presence of the masses, and powerfully influenced public feeling on the

was an honour greater than any he had yet attained to; but he saw that his acceptance of it would damage the popular interest, and he at once besought his friends to transfer their votes to Mr. Trumbull, whose election he well knew would be more to their advantage. Mr. Trumbull was accordingly elected, and Lincoln's voluntary self-sacrifice had the effect of giving permanent organisation to the anti-Nebraska party.

In the formation of the Republican party, which in a manner superseded the old Whig party to which he had hitherto adhered, Mr. Lincoln took a prominent part. In 1856, the year of the nomination of Presidential candidates, he adopted the platform of the Republicans of Illinois, which was totally opposed to the spread of slavery, and, starting on the canvass, laboured strenuously during the campaign in sustaining the nominations of Fremont and Dayton. Buchanan, however, was elected President, and came into power in March 1857, and ere long was found to be favourable to the foul policy pursued towards Kansas, and acting in accordance with the dictates of the pro-slavery interest. Then came the Lecompton Convention, which, under its leader, Calhoun, was nothing less than a conspiracy to force in an underhand way a slave constitution on the people of Kansas. Judge Douglas supported the Convention with all the eloquence at his command, and with still greater sophistry; but Lincoln met him, or followed after him, and was successful in overthrowing his arguments and exposing his casuistry. Much of the dispute turned on the Dred Scott decision, the purport of which was, as the reader will recollect, that an escaped slave should be restored to his owner when caught in a free State. Judge Douglas would have made this decision

a perpetual law—a charter, in fact, for slavery; Lincoln would have it reconsidered and reversed, so that it might be quoted as a charter for freedom. His arguments on this question, which we have not space to give here, were most subtle and ingenious, while they were

its work, Judge Douglas, who more than any one else had nursed it with strength, suddenly turned round and embraced the opposite side of the question. Whatever his motive, people did not fail to attribute his tergiversation to the fact that his seat in the senate would

A. Lincoln

obviously unanswerable. They were indeed so little to the taste of his learned opponent, that that worthy

depend on the election which was shortly about to come off in Illinois, where the disputant whose arguments he

LINCOLN HOUSE, SPRINGFIELD, ILLINOIS.

showed ever afterwards a decided disinclination to a personal renewal of the dispute.

In 1858, after the Lecompton Convention had done

so little relished had already been nominated, and where, on the 15th of June, a resolution had been passed at Springfield, declaring "That Abraham Lincoln is the

first and only choice of the Republicans of Illinois, for the United States Senate, as the successor of Stephen A. Douglas."

The contest was both sharp and severe, and none the less so that it was carried on without any show of acrimony on either side. It was prolonged until the end of October, and created an extraordinary interest, not only in Illinois but throughout the whole country. It was evident to most observers that Lincoln was from day to day gaining a decided advantage over his antagonist, whom he repeatedly forced into admissions essentially damaging to his political character and prospects. In the joint discussions held from time to time, the balance of argument seemed invariably to the credit of Lincoln. In the end, however, Lincoln was defeated, not for want of votes, for he had, altogether, more than a thousand majority over Douglas, but by the clever tactics of Douglas's party, who, by diverting their votes, managed ingeniously to obtain majorities in the greatest number of the legislative districts, and thus to make their candidate secure.

The great talent and the manly conduct manifested by Lincoln in this contest were, however, in the end productive of more advantage to him than the gaining of his election as a senator would have been. Throughout the whole campaign he showed himself an able statesman, a powerful orator, a true gentleman, and an honest man; and it was these qualities which now led to the spontaneous suggestion of his name in various parts of the country as a candidate for the presidency. While, therefore, Douglas was returned to the senate, there was a general presentiment that a juster verdict was to be had yet, and that Lincoln and his cause would ultimately triumph.

In 1859, Mr. Lincoln was again on the canvass for the Republican party, and earnestly opposing measures, the tendency of which was to encourage slavery. He visited the State of Ohio, speaking first at Columbus and then at Cincinnati, in both places with marked good effect. In the spring of 1860, in answer to calls made upon him, he visited and spoke at various places in Connecticut, New Hampshire, and Rhode Island; and journeyed also to New York, where, at the Coopers' Institute, he delivered, on the 27th of February, one of the greatest speeches of his life. It was during his stay at New York at this time, that an interesting incident occurred, which is thus related by a teacher in the Five Points House of Industry, in that city:—

"Our Sunday school in the Five Points was assembled, one Sabbath morning, when I noticed a tall and remarkable-looking man enter the room and take a seat among us. He listened with fixed attention to our exercises, and his countenance manifested such a genuine interest, that I approached him and suggested that he might be willing to say something to the children. He accepted the invitation with evident pleasure, and, coming forward, began a simple address which at once fascinated every little hearer and hushed the room into silence. His language was strikingly beautiful, and his tones musical with intensest feeling. The little faces around would droop into sad conviction as he uttered sentences of warning, and would brighten into sunshine as he spoke cheerful words of promise. Once or twice he attempted to close his remarks, but the imperative shout of 'Go on! Oh, do go on!' would compel him to resume. As I looked upon the gaunt and sinewy frame of the speaker, and marked his powerful head and determined features, now touched into softness by the impressions of the moment, I felt an irrepressible curiosity to learn something more about him; and when he was

quietly leaving the room, I begged to know his name. He courteously replied, 'It is Abra'm Lincoln, from Illinois.'"

In the spring of 1860 all eyes were turned towards Chicago, where the Republican National Convention was to meet, to consider what names should be put on the Presidential ticket, and to discuss the merits and availability of the men who should be proposed. On the morning of the 18th of May, amidst the most intense though subdued excitement of the twelve thousand people inside the "Wigwam," in which the Convention was held, and the anxious solicitude and suspense of the still greater number outside who could not gain admission, it was voted to proceed at once to ballot for a candidate for President of the United States. Seven names were presented in the following order:—Seward, Lincoln, Dayton, Cameron, Chase, Bates, and McLean. Loud and long-continued applause greeted the first two of these names, and it was soon apparent that between them the chief contest was to be. On the third ballot the name of Lincoln was fifty votes ahead of that of the highest of the competitors. The scene which followed—the wild manifestations of approval and delight within and without the hall, prolonged uninterruptedly for twenty minutes, and renewed again and again for half-an-hour more—it is impossible to describe. Never was a popular assembly more stirred with a contagious and all-pervading enthusiasm. The nomination was made unanimous on the motion of Mr. Everts of New York, and speedily the news of the event sped along the electric wires to all parts of the land. The demonstrations at Chicago were but a representation of the common sentiments of the masses of the Republican party, and of thousands among the people, not before included in its ranks, in the country at large. From that day forth the wisdom of the nomination of Abraham Lincoln for the highest place in the American Government was universally acknowledged. As a man of the people, in cordial sympathy with the masses, he had the unreserved confidence of the sincere friends of free labour, regardless of party distinctions. As a man of sterling integrity and incorruptible honesty, he was felt to be a suitable agent for upholding the Federal Government in its impending days of trial.

The following is a copy of Mr. Lincoln's letter, accepting the nomination:—

"HON. GEO. ASHMUN, *President of the Rep. Nat. Con.*

"SIR,—I accept the nomination tendered me by the Convention over which you presided, and of which I am formally apprised in the letter of yourself and others, acting as a committee of the Convention for that purpose. The declaration of principles and sentiments which accompanies your letter meets my approval; and it shall be my care not to violate, nor disregard it in any part. Implying the assistance of Divine Providence, and with due regard to the views and feelings of all who were represented in the Convention, to the rights of all the States and Territories, and the people of the nation, to the inviolability of the Constitution, and to the perpetual union, harmony, and prosperity of all, I am most happy to co-operate for the practical success of the principles declared by the Convention.

"Your obliged friend and fellow-citizen,

"ABRAHAM LINCOLN."

The popular favour with which the nomination of Mr. Lincoln had been received was strengthened by the spirited canvass that followed. The result of operations was not declared until the 13th of February, 1861, when it was found that for Abraham Lincoln the electoral votes were more than double the number

obtained for any one of the other candidates. The Vice-President, Mr. Breckenridge, therefore officially declared Abraham Lincoln elected President of the United States for four years, commencing on the 4th of March, 1861.

On the morning of February 11th, Mr. Lincoln, with his family, left Springfield for Washington. A large concourse of citizens had assembled at the depôt on the occasion of his departure, whom, with deep emotion, he addressed as follows:—"My friends, no one not in my position can appreciate the sadness I feel at this parting. To this people I owe all that I am. Here I have lived more than a quarter of a century; here my children were born, and here one of them lies buried. I know not how soon I shall see you again. A duty devolves upon me which is, perhaps, greater than that which has devolved upon any other man since the days of Washington. He could never have succeeded except for the aid of Divine Providence, upon which he at all times relied. I feel that I cannot succeed without the same Divine aid which sustained him; and in the same Almighty Being I place my reliance for support, and I hope you, my friends, will all pray that I may receive

that Divine assistance, without which I cannot succeed, but with which success is certain. Again I bid you all an affectionate farewell."

Having traced the career of Abraham Lincoln from infancy to mature manhood, and from the humblest industrial labour to the possession of the highest dignity which his country could bestow, we take leave of him here, feeling very sure that the lesson of his life can hardly be lost or misapprehended. The events of the four years that followed his assumption of the Government—years of unparalleled suffering and trial, and of unflinching adherence to right and justice amidst the horrors and alarms of the bloodiest struggle of modern times—these are too well known to need recapitulation. How thoroughly the man of the people redeemed his pledge to the people, and postponed every consideration of his own interest or ease to their welfare—how ready and prompt he was to stay the shedding of blood and quench the spirit of revenge when his enemies were at his feet—and how, in a moment of seeming rest and tranquillity, he fell by the assassin's hand—all these things are still fresh in our memories, and we recall them involuntarily with the honoured name of Abraham Lincoln.

THE TOMB OF ABRAHAM LINCOLN.

COTTON AND RAILWAYS IN INDIA.

At the end of last autumn Mr. William Campbell, a gentleman connected with railways in India, and recently returned from the East, communicated valuable information upon the capabilities of the Punjab and other districts for growing cotton. He was asked by the Council of the Cotton Supply Association to furnish them with a written report. Residing at Umritsur, which he describes as the Manchester of the Punjab for commerce and enterprise, he had opportunities of witnessing the marvellous changes effected by the opening of the railway from Lahore to Multan. He is of opinion that the Punjab could by railways and by irrigation be made one of the most fertile and prosperous countries of the world. Scinde and the Punjab, with the States under control, cover an area of 130,000 square miles, with a population of about 25,000,000, industrious and hardy for labour; and the administration is a model to all parts of India.

Mr. Campbell's report, apart from its mere commercial aspect, presents so interesting a view of the progress and prospects of railways in India, that we are sure our readers will be glad to have some extracts from the personal narrative:—

I visited the railway stations at Bombay, and saw the passenger trains arrive and depart. There were crowds of native passengers, all of whom were quiet and orderly. I saw also the goods trains, and every waggon was well loaded, and full of cotton and general merchandise. It was said all over Bombay that the railway companies could not meet the wishes of the trading community, arising from a deficiency of rolling stock. Parties in the cotton districts had to wait for weeks before they could get their goods sent to port for shipment.

The passenger trains were well filled with second and third-class passengers. Many of the Parsee ladies rode

in the trains unveiled, a proof that caste is gradually giving way to modern customs.

After spending a few days at Bombay I left by steamer for Kurrachee, where we arrived on the second day at eight a.m. We landed, and proceeded at once to the Scinde railway-station. The traffic passing to and from the custom-house was very great, and increasing daily. The goods were being carried on bullock carts, camels, ponies, bullocks, mules, and on men's heads.

Kurrachee is the head-quarters of the Indo-European Telegraph, and has now become the port at which all European troops arrive or depart from India. It is also the western terminus of the Scinde Railway. The late General Sir Charles Napier said, in 1842, "If any civilised man should ask—Were you ruler of Scinde, what would you do? I would abolish the tolls on the rivers, make Kurrachee a free port, protect Shikarpore from robbers, make Sukkur a mart for trade on the Indus. I would make a trackway along its banks. I would get steamboats." These words were written twenty-three years ago, when Sir Charles Napier was Governor of Scinde, and I could not help thinking how prophetic they were when I was travelling through Kurrachee, and up the Indus. Sir Charles Napier says, "I would make a trackway along the banks of the Indus." I saw the staff of civil engineers who were engaged in the survey of the Indus Valley Railway, which will be the connecting link with the Scinde Railway at Kottree, and will join the Punjab Railway at Moulton. Sir Charles Napier further says, "I would get steamboats." I went from Kottree to Moulton by steamer, and made some of my notes on board. While at Kurrachee I saw large quantities of cotton arrive by train, and waiting to be shipped for England. Kottree is the eastern terminus of the Scinde Railway, and the departure port of the Indus steam flotilla. The traffic from Kurrachee to the Punjab and Central Asia will pass through Kottree. Here river travelling terminates, and the remaining distance is accomplished by rail. Trains leave Kottree for Kurrachee daily. The distance is about one hundred miles, and the time occupied upon the journey about five hours.

At Kottree, on the banks of the Indus, and near to the railway-station, was to be seen the whole of the cotton coming down the river by steamers and native boats.

The cotton occupied a large space. None of the bales were pressed. The Indus was high and rapid, and the current strong, and we proceeded only a very short distance the first day. We stopped every night at sundown at one of the wood or fuel stations. I landed and walked some distance inland to collect wild plants and flowers, and examine the quality of the land. The soil is in very good condition, and, in my opinion, well adapted for the growth of cotton. It is an alluvial deposit of great depth. I was a month journeying on the Indus, and I examined the soil at sundown (at twenty-eight different places) for twenty-eight days. I never saw anything to equal the rich quality of the soil on the banks of the Indus.

At Sukkur we stopped for half a day and a night to land goods and stores for the English army in Peshawur and Rawal Pindee, and other places in the Punjab. The goods were transhipped on small steamers, which plied on the Sutlej and some of the other rivers, from which great quantities of cotton were conveyed and left at Sukkur for the return of the Indus steam flotilla steamers.

I saw piles of cotton on the banks of the river at Jukhar, and ascended one of the highest minarets, and

had a most extensive view of the surrounding country. There is a very large tract of land, stretching as far as the eye can see, capable by a judicious system of irrigation of producing crops of wheat or cotton or of rice. A branch railway in connection with or from the Indus Valley Railway, from Sukkur by Shirkapore, and Jacobabad to Dodur, near to the entrance of the Bolan Pass, will add much to the prosperity of the town. Sukkur is the *entrepôt* of the produce and the manufactures of Kandahar, Bokhara, Herat, and other places, from whence come quantities of dried fruit, Persian carpets of beautiful texture and designs, wool, etc., for exportation. I saw the Bolan Pass from the steamer. When we entered the province of the Punjab, I observed a marked difference in the wheat, barley, and other crops. The wheat looked healthy and abundant, and the whole country along the banks of the river looked delightfully green and grateful to the sight after the dry and parched land of Scinde. The Persian wells were to be seen in great numbers on the banks of the Indus. At Moulton there were some thousands of bales of cotton waiting to be shipped on board the steamers and other boats for Kottree, thence by railway to Kurrachee.

Moulton is the western terminus of the Punjab Railway. I left Moulton for Lahore by rail. The country on either side of the railway is a jungle, but the land is level and good, and a canal made from Lahore to Moulton would soon improve the state of the country. As soon as I entered the Punjab I saw signs of British enterprise in all directions, and as a proof that British rule is popular and good, the maharajahs and chiefs of the province have subscribed nearly £20,000 sterling for the purpose of erecting some suitable testimonial in honour of the previous governor, Sir Robert Montgomery. The whole of this sum is left in the hands of Mr. Cooper, C.B., her Majesty's Commissioner at Lahore.

I left Lahore for Umritsur, where I remained for several months. While there I had opportunities of acquiring a local knowledge of the traffic of this city. Umritsur is the Manchester of the Punjab for commerce and enterprising merchants. I saw the old mode of transit of goods from Umritsur to Moulton and other places by road, and witnessed the transfer of that traffic from the road to the railway, on the opening of the Punjab Railway from Lahore to Moulton, and the change was so great that I was deeply impressed with it, more so than by any similar change I have witnessed, though closely engaged in railway work in England for more than a quarter of a century. When telegrams were received from England for cotton, a demand was made all over the city and in the country for vehicles and camels. I saw the native mode of transit, which I note, so that you may have some idea of the change. There were thousands of camels employed, and the bullock train was used for the conveyance of general merchandise and cotton. I saw this wretched bullock train—the necks of the animals being covered with dreadful sores, going at the speed of two and a half miles per hour. Cotton was also carried by every other conceivable method—on camels, ponies, bullocks, mules, donkeys, hackneys, and on men's heads, going from Umritsur to Moulton, a journey of upwards of 258 miles, there to be shipped to Kurrachee, thence to England. Man and animal used to travel day and night, resting but very little on the journey, exposed by day to a blazing sun and clouds of dust, and to the dews and deadly fogs at night. The time occupied on the journey varied from ten to twenty days. The goods are now sent 258 miles by railway in one day,

This, then, is a simple account of the change effected in the conveyance of goods; and, when I think of the dreadful torture to dumb animals all over India previous to the introduction of the railway system, I cannot help expressing my admiration of the immense benefits derived from the change, and the pleasure produced by the extinction of a practice at once barbarous and cruel.

Umritsur, besides being the wealthiest city in the Punjab, is a place of pilgrimage for the Sikh nation. There are 600 priests attached to the temple, and service is performed in it day and night. I shall now note the change in the passenger traffic. I witnessed the change from the road to the rail in England. I now witness the change in India, which is much greater. The native pilgrims to and from the Ganges, native pilgrims to and from Mecca, the pilgrims to and from the Golden Temple of Umritsur, the poorest native woman with her baby, to and from the Bazaar, now feel that they travel in perfect safety. All classes and castes have taken kindly to railway travelling. Passenger traffic is on the increase all over India. I have myself assisted in putting as many as 3,200 natives in one train in perfect order. Some of the carriages in the Punjab contain two storeys. The native women have carriages for themselves, and they prefer to ride in the top storey. The starting of the train is orderly, much more so than a train containing a similar number of passengers in any part of England. But on the arrival of a train the noise is perfectly deafening, particularly if the night is dark—wives calling for their husbands, husbands responding and calling upon their wives, make it a scene of noise, bustle, and confusion that once seen can never be forgotten. All is over in about twenty minutes, the platform cleared, peace restored, without any accident or harm happening to any of them.

The journey from Lahore to the base of the Murree Hills was performed during the night in a garry, or native two-horse vehicle. I arrived at the ferry of the Jhelum river at three o'clock in the morning. I was actually six hours in crossing. Every second yard the boat stuck in the mud. A correspondent of an Indian newspaper, as far back as April, 1855, says, "I brought to England a small quantity of cotton (the raw material), grown from acclimatised American cotton seed, in a district on the banks of the river Jhelum. This specimen I had shown to several cotton spinners in Manchester. They pronounced it to be the finest specimen of cotton they had seen grown in India, even directly from American seed, and to be worth from $6\frac{1}{4}d.$ to $6\frac{1}{2}d.$ per lb."

The rivers in the Punjab are the Indus, which flows under Attock; the Jhelum, which flows under Jhelum city; the Chenab runs between Guzerat and Wuzerabad; the Ravee flows under Lahore; the Beas, between Umritsur and Jullender. The Sutlej flows near Lodiana, and the Jumna, near Delhi. The Trenab is formed by three rivers flowing into it—the Jhelum, Ravee, and Chenab. Along the banks of these rivers lie portions of land admirably adapted for the growth of cotton.

I saw in the Bazaar at Rawal Pindee a large space of ground occupied with cotton bales, to be sent by bullock trains. At Rawal Pindee I engaged a doolie, that I might be carried some 8,000 or 9,000 feet up in the Himalayas. I may remark that the first bales of cotton I saw were in the harbour of Alexandria, and the last far away in the Himalayas, many thousands of miles apart. I met about twenty men early one morning loaded with cotton: they looked tired and footsore. Each had a heavy load of cotton on his back, and to each burden was attached six pairs of straw sandals.

They were very fine men and very courteous. They said they came from (or near) Gilzit, a region occupied by a class of people whose traditions tell them that they are the descendants of Alexander the Great's army.

As a proof of how general the growth of cotton has become in the East, besides the places already quoted, I may state that I saw it on my return journey to Delhi and Calcutta, at every station and in every town, and on the roads, being there carried by camels and bullocks.

Appended to Mr. Campbell's narrative is a statement of the existing condition of the railways of India:—

The East India Railway Company, the head offices and eastern terminus of which are at Calcutta. The north-western terminus is at Delhi. At present the trains start from Delhi, on the east side of the Jumna river. A railway bridge over the Jumna and a terminus were nearly finished when I passed through Delhi. This bridge will connect Delhi with Calcutta and the Delhi Railway to Umritsur without any inconvenience to travellers.

The Madras Railway Company has its head office and terminus at Madras, and its western terminus at Beypoor. It will join the Great Indian Peninsular Railway at or near Hyderabad. By this junction Madras and Bombay can exchange traffic.

The Great Indian Peninsular Railway has its head office and its eastern terminus in Bombay. A branch of this line goes to Jubbulpore, and joins there the East Indian Branch Railway to Allahabad, thence to Delhi or Calcutta.

The Bombay and Baroda Railway Company has its head office in Bombay. It is proposed to make a branch to Hyderabad, the great military station in Scinde, where it will join the eastern terminus of the Scinde Railway and the junction of the proposed Indus Valley Railway.

The Scinde Railway Company has its head office and western terminus at Kurrachee. Its eastern terminus is at Kottree, the starting-point of the Indus steam flotilla. It will join the Bombay and Baroda, as stated above, and exchange traffic with the Bombay Presidency at or near Kottree.

The Indus Valley Railway Company. This line will be a continuation of the Scinde Railway. It has been surveyed, and is only waiting the Government sanction to construct it. It will join the Scinde Railway at Kottree, and follow the course of the Indus to Mooltan, where it will join the Punjab Railway. It will have a branch from Sukkur to the Bolan Pass. This line will be one of the connecting links which will join Central Asia to Central India, by which passengers and goods will be conveyed to and from those countries.

The Punjab Railway Company has its head office and western terminus at Lahore; its eastern terminus at Mooltan. It was opened for public traffic from Lahore to Mooltan in May, 1865. It will join the Indus Valley at Mooltan.

The Umritsur Railway has its head office and eastern terminus at Lahore; its western terminus at Umritsur. It has been opened for several years, and is about thirty miles in length. It joins the Mooltan line at Lahore. Trains for passengers and goods run regularly between Umritsur, Lahore, and Mooltan. Umritsur, it is thought, will be the terminus of the Delhi Railway Company.

The Delhi Railway Company. This line has its head office in Lahore: it is being constructed, and is expected to be opened in a few years. It will connect the East India Railway at Delhi, and the Punjab and Umritsur Railways at Umritsur.

The Lahore and Peshawar Railway Company. This line has been surveyed, and will be a most important link with all the great railways in India and Peshawar, at the entrance of the Kyber Pass. It has to cross three rivers—the Ravee, the Chenab, and the Jhelum. The country from Lahore (its southern terminus) for eighty miles is flat, so that there will be no engineering difficulties. The northern terminus will be at Peshawar, the north-west boundary of British India, and near to the Kyber Pass. I saw the traffic locally on the Grand Trunk Road by day and by night. It is proposed to make a branch to the salt range, the mines of which the Government have the monopoly, and they are inexhaustible. There will be a tunnel in the salt range about a mile and a half long. Mr. Lee Smith, civil engineer, who was in charge of the survey of the line, kindly showed me all his plans, which he was preparing for the Indian Government. The subject of a railway to Peshawar I found to be the engrossing topic among all classes along that part of India, which is the only apology I can offer for the length of my remarks on it.

During my journey through the cotton districts in India, I observed immense piles of cotton and other goods at the railway-stations, waiting the arrival of waggons to convey the traffic to seaport towns to be shipped to England. It was found perfectly impossible to meet the demand for rolling stock; in reference to which Mr. Danvers, the Government director of the Indian railways, in his report of 1865-66 to the Secretary of State for India in council, says: "At some of the stations on the East Indian Railway such was the demand for trucks, that it is supposed bribes were given to secure a preference, and it was proposed by a committee appointed to apply a remedy, that the trucks should be put up to auction, ignoring altogether the established rates. This would not have been a proper arrangement, and it was accordingly decided to fix higher charges generally. The rolling stock is inadequate for the present traffic. Orders have been given for 418 engines, delivery of which will, however, be spread over three or four years."

Since then the companies have made great exertions to get the necessary supply of engines and waggons, and in the Government official report of 1866-67, I find that most of the railways have increased their rolling stock. The number of locomotives added in 1866 was 70. The number of passenger carriages in 1866 was 250. The number of trucks and waggons in 1866 was 1,273, which, added to the rolling stock on hand, made a gross total on all the railways on the 31st December, 1866, of 19,280 vehicles.

"The length of line open for traffic had, during the year 1866, been increased from 3,331 miles to 3,638 miles, and the extent now sanctioned (including the Indian Branch Railway) is 5,641, instead of 4,924 miles. One-third of the whole will probably have to be made with a double line within the next five or six years.

"On the 1st January last, the total amount of goods which had been provided for the railways from this country was 3,195,862 tons, which cost about £20,200,000."

In 1864-65 the number of passengers was about 12,500,000. In 1865-66, they amounted to about 12,867,000, and 10,120,920 train miles were run.

It appears that 94 per cent. travel in third, 4·78 travel in the second, and 1·12 in the first class, from which it will be seen that "cheap fares are stronger than caste."

It is fully expected that by the beginning of 1869 continuous railway communication between Calcutta, Madras,

Bombay, and the Punjaub will be established. The clearing-house system of this country will soon be applied to India, and the most satisfactory arrangements will be made for the interchange of traffic, which must be advantageous both for the companies and the public. There will also be a thorough audit of accounts by well qualified persons.

The railway system in India is a great boon to the English soldier. Nothing so tends to swell the sick list of a corps as the ordinary march through the country, owing to the men being exposed to varieties of temperature, dew, and chill, and to bad water, fertile sources of dysentery and other fatal diseases.

Those who have travelled much through the north-west provinces and parts of the Punjaub must frequently have remarked the numerous rude pieces of tin bearing a name, probably half obliterated, nailed to trees and posts in the vicinity of encamping grounds, these homely mementoes being placed there to denote the last resting-place of a comrade or friend.

Such scenes are of course rarer now than formerly. The large number of deaths constantly occurring on the line of march must naturally diminish on the completion of railway communication.

There are many men now in India who will recollect being on the march during the Sutlej and Punjaub campaign from five to six months, and after all they did not arrive at the scene of conflict in sufficient time to participate in what they reckoned the honour of an engagement with the enemy.

When the Presidencies are joined by the railway system each with the other, the Commander-in-Chief can, in the event of mutiny, invasion, or war, telegraph to all the military stations, and order, if necessary, from Bombay, Madras, and Bengal, simultaneously, by the various railways, an army of 100,000 soldiers, including every arm of the service. This army can be landed in one week at the Khyber Pass, or in any part of India to which the railway system will be extended.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

WHY should a man "*be dead a hundred years*"—by which time nobody cares much about him—before it is reckoned quite timely to illustrate his character by publishing any of his correspondence? Assuredly there are very many letters of the recently lost, and even of the living, which may be laid before the world, not only to the profit of the readers but to the honour of the writers. Her Majesty has afforded us a most admirable example of this in the publication of the Memoirs of her lamented Consort. And it must have occurred to every thoughtful mind, that a single letter, or a single expression in a letter, has often marked a striking trait in the character of the writer, which might furnish a key to the right interpretation of much of his outward life and action.

My present object, however, is far from discussing the general question, and simply refers to the first of these propositions, and a desire to submit some characteristic examples from a few letters which may possess peculiar individuality, and sometimes throw a light upon points of public interest. They are taken from a mass of papers accumulated during a long period, in correspondence with many of the memorable men of the times; and I trust that not a line has escaped me which could hurt a feeling of the living or violate a sanctuary of the dead. I regret that the necessity for conveying

the complete sense of the letters should have forced me to allow passages complimentary to myself to pass, but the dilemma could not be avoided; and it would be easy (without claiming personal desert) to show the reason why such liberal praise was bestowed upon the conductor of a periodical (the "Literary Gazette") which had the merit of originating a new and popular form of intellectual intercommunication, opening hitherto sealed sources of information, and supplying a more frequent channel for letting the world know what was doing by the working men in science, literature, and the fine arts. They were pleased with this ready means, and during many years contributed to the success of their medium, till numbers divided attention, and it passed away, leaving the enlarged and important sphere to be enlightened by the great amount of talent now illuminating the periodical press with every succeeding week. And I trust that small apology may be deemed necessary for an editor who could not regret that his holding the candle was recompensed by so much laudation.*

So, without further preface, I begin my series with one estimable friend, lately lost to the science he so especially adorned—

MICHAEL FARADAY.

His simplicity of manner, genial character, and scientific attainments, have been so unanimously dwelt upon by the public press, that I will confine my introductory remarks to a very few words. Without a trace of assumption or self-assertion, the great philosophical unfold of the hidden phenomena of Nature resembled in society a fine ingenuous boy, quick and "all-alive" to whatever was going forward, with a merry laugh on occasion, and never a dogmatic brow. He was truly a delightful companion, and a wonderfully clear instructor when drawn upon for the latest discovered secrets, of which he held the master-key. The annexed, relating to an important epoch in the Royal Institution, is, in my humble judgment, purely characteristic of the writer:—

Royal Institution, January 23rd, 1833.

DEAR SIR,—So soon as I was allowed I hasten to tell you of what I am sure will, in your public and private capacity, give you great pleasure—Mr. Fuller's splendid patronage of science at our Institution. He has communicated to the managers his intention of founding a Professorship of Chemistry in the Royal Institution, with a salary of £100 per annum. He is now engaged in securing trustees of the highest national character, in whose name he may invest the large sum necessary to produce this income; and in a week or two you will hear of the act being completed.

I need not tell you what pleasure and encouragement it gives us, at this commencement of a new season, to find that our exertions at the Institution are not in vain, but that, besides the award of high praise as to scientific character, both abroad and at home, we are also securing a continued existence by obtaining support.

I cannot resist telling you that Mr. Fuller makes it a condition that I should be the first to fill the new chair. You may be sure that I will endeavour to fill it honorably, and, if possible, make the Fullerian Professorship high in character from its very commencement.

I am allowed to tell you these things as matter of conversation; but, if you think right to use the knowledge, you must not refer to me as the source: it would look too like quackery. Whether you care about noticing Mr. Fuller's generous intentions or not, I am sure you will be glad to know them.

I am, dear Sir,

Most truly yours,

M. FARADAY.

I am tempted to add an extract from a much later letter, to show how prompt he was to acknowledge the

merit and spread abroad the fame of his contemporary labourers.

Royal Institution, 11 January, 1837.

MY DEAR SIR,—I write this note principally for the purpose of stating the subject of the opening ceremony, which I must give. I thought that perhaps you would like to mention it in the next Gazette, as being new to English men of science. Mossotti, who is, I believe, appointed a Professor at Corfu, has, by recent clever and deep investigation, shown that it is probable the phenomena of *electric* attraction and repulsion, with the attraction of *aggregation* and the attraction of *gravitation*, may be reduced to one simple law, as much more universal than gravitation as these three sets of effects exceed those of gravity alone. It will, of course, be my business to give this as popular a form as I can at the meeting in question.

Ever, dear Sir,

Yours faithfully,

M. FARADAY.

It was with great gratification that I have observed Her Majesty's spontaneous command to the Earl of Derby, as Prime Minister, to take into consideration the claim of Mr. Faraday's widow to national consideration. For our quiet philosopher was not only most worthy of honour for his splendid achievements in the highest walks of science, but eminently deserving of reward for the application of his researches to public services of general utility. In 1842 I was one of the witnesses of the experiments on his admirable invention for carrying off the heat and products of combustion from artificial light (an invention worthy to compete with his predecessor Davy's safety-lamp); but this was only one of many of the beneficial improvements in the general requirements of civilised society, which he was always suggesting or bringing forward. His portrait, engraved by C. Turner in 1838, ought now to be revived and published.

HANS CHRISTIAN ANDERSEN.

On selecting a foreign subject for my next illustration, a brief explanatory introduction may serve to give it more point. In October 1846, noticing in the "Literary Gazette" the author's "Poets' Bazaar," I expressed a hope that he would fulfil "his intentions of coming to visit us in London." A letter from Copenhagen, to his friend Mr. Lahmeyer in London, and courteously communicated to me, informed us of, at any rate, merely the postponement of this hope, as Andersen had returned from Naples, broken down in health, though shielded by three royal orders, and was forced to discontinue his projected travels through Spain and Portugal to England. He, however, soon after made out the journey direct, and, expressing a wish to be introduced to me, I met him with most cordial feelings, and had my admiration of the poet exalted by an equal esteem for the man. To me his genius seemed to revel within a sphere of perfect purity. He was simplicity itself—the child of nature. I had great delight in doing what I could to render his stay amongst us agreeable to his wishes.

I can imagine no other human being expressing more frankly the genuine feelings of the heart, with the utmost sincerity and without the least reserve, than Hans C. Andersen. The following note, brief as it is, may be reckoned a fair specimen of his enthusiastic and poetic spirit* :—

Lexmount, Trinity, near Edinburgh.

16 August, 1847.

DEAR FRIEND,—I am in Scotland, in the town of Walter Scott, in the mountains of Burns; it is beautiful sunshine, and I am in a hospitable Danish home: it cannot be better. Next

* The needful introductory matter is as brief as possible, and if a brief anecdote is here and there thrown in, it will, it is hoped, be found in harmony with the design.

* The names of places, it will be seen, are not correctly spelled: but I have given the writer liberality, and the localities will be readily recognised not only by Scottish but English readers. Andersen's mastery of our language is far beyond the ordinary foreign mark.

Thursday I intend going to the Highland, and, if health and strength permit, to Loch Lagan, where Prince Albert will see me; but first of all, my dear friend, I must send you my kind regards and sincere thanks for all your friendly attentions. In ten or twelve days I shall return to London, where I only remain two days; time will not permit a longer stay, as I must be in Lipsic on the first of September. Do you think I could have the pleasure of meeting Bulwer and Dickens—my dear Dickens—in these two days? I shall previously inform you of the day of my arrival. Pray present my kind regards to your home, and remember me to Lady Blessington.

Yours truly,

H. C. ANDERSEN.

I have only to explain that his compliment to Lady Blessington was due to her hospitality in having invited him the first on his arrival, under my charge, to Gore House, where, to his unfeigned and never-forgotten astonishment, he dined with the present Emperor of the French and the Duke of Wellington, (then Prince Napoleon and Marquis of Douro), at the head of the table. The bewildered author could by no means reconcile himself to the fact that the nephew of the mighty Napoleon, and the son of the conquering hero, could sit down, even with a lady between them, without fighting à l'outrance.

In the way of illustrating by characteristic letters, I may here introduce another tribute to the Danish Knight (of Danneburg), an invitation at once cordial and flattering, but amusing from the contrast, and the "base use" of being one of the attractions in a Lord Mayor's fête. The note is from the celebrated civic magnate, Sir Peter Laurie:—

7, Park Square, 29 June, 1847.

MY DEAR JERDAN,—I have this moment received a note from Mr. Andersen, saying he is engaged for to-morrow. Now I have told the Lord Mayor, &c., &c., and they are coming to see him, and Haynes is coming to report his speech. Can you see him? and, as we dine at five, he can get to a fashionable dinner at half-past seven. Pray see him; he says some other opportunity we shall have. No other opportunity for twelve months. I want a "lion;" poor Sir Geo. Pollock is not well enough.*

Yours truly,

P. LAURIE.

After his return home I received the following:—

Copenhagen, 17 March, 1848.

Dronningens tvegade, 147.

MY DEAR FRIEND,—My happy stay in England, where you, in particular, contributed so much to my comfort, stands so vividly in my thoughts that it almost appears to me as if it were but a few weeks since I was there; if, however, I look into the almanac it shows me that it is months since, and I reproach myself for not having written to you, not thanked you for the indescribably hearty reception you gave me, and that good feeling you have shown towards me. Almost every week have I thought of writing to you; but a new story, a chapter of my new work, or a business letter which I was compelled to answer, has sprung in between. But now I will write, and in thought look into your clear, honest eyes, &c. * * * * * But this is altogether in thought; yet this letter is but a shadow thereof, and this I send you, and know that thoughts are realities.

I have, since we saw each other, had the great misfortune to lose my beloved King Christian the Eighth. He was a noble, an accomplished, and an amiable man, who felt warmly for all that was good and clever. To me he was more than

gracious, he showed the most sincere sympathy and kindness towards me. I cannot as yet accustom myself to the thought that I have lost him for ever in this world. I will here give you a little trait of him, which shows how thoughtful he was even in minor affairs. When I left here for England, he said to me, on taking leave, "It is expensive to live in England; I should not like you to be in any pecuniary embarrassment there, and if it should be the case, then write to me." I felt this tender care for me, it affected me, and I thanked him, at the same time telling him that I should not be in any difficulty, as I had a certain sum which I had received for the German edition of my collected works, and that more I should not and could not expend. "I mean it with the best intention," said the king: "it might happen that you required more; if so, write to me." It was said so kindly and so heartily, and I answered as I ought to do, "No, your Majesty, I cannot accept your offer, I do not require it, and I have already had so many and different proofs of your great condescension; but if you will permit me to write a letter to you, and tell you how it fares with me, what impression the country and the people make on me." And the king allowed it, and I wrote such a letter as he received with his whole heart and mind.

You know not how firmly, how sincerely I loved that man; not for his crown's sake, but for his whole personality. May God gladden him in heaven, as he would willingly have gladdened all on earth. It was, of course, only an accident, but there often lies in that accident a strangely poetic one. It is said here that on the very day the king died a wild swan came flying towards Roeskilde church (the cathedral church in which all the Danish kings are entombed); the swan's flight was so rapid that it struck its breast against one of the spires, and fell down dead.

The late great events that have taken place in France have also affected me deeply; it is a serious time that now unfolds itself; yet, whatever may happen, however much may change and fall, there is One who will never change, never fall—God!

Among the few sunbeams that have of late fallen on me, and which I gather to my heart, like a cheerful scene on a gloomy day, is a kindly letter from Charles Dickens, and a truly sisterly one from Jenny Lind, in Stockholm. She speaks with much pleasure of her coming departure for London; I wish that I could think of a similar one, but it will not be. The Grand-Duke of Weimar has done me the honour to send me a knight order, and the King Oscar of Sweden has conferred on me the order of the North Star. These proofs of a desire to honour and gratify me always make a sad impression on me; and yet I am glad, but feel an anxiety as if I did not deserve them.

My new work I think will appear in London in July. It is now twelve years since I wrote my first novel, "Only a Fiddler." I hope that this will surpass the earlier ones in the rounding off and drawing of the characters.

How is that excellent young man Mr. Durham? He promised me that I should have a cast of Jenny Lind's and my own bust early in the spring. Glad as I should be at any time to receive such a gift, yet I think I must beg you to remind him, if it interests him, to leave these two works of art in the Danish Gallery of Art, which opens on the second of April, and continues open for five weeks; that, if he sends the busts well packed to Mr. Hambro and Son, 70, Old Broad Street, London, they will forward them by the first vessel.

Will you give my most hearty and respectful compliments to the Countess of Blessington? I have a little story for her next Annual, which I will take the liberty to send her. I hope she received a book from me through Mr. Bentley.

My compliments to Dickens—I will write to him myself soon, to thank him for his friendly letter. Give my heartfelt greeting to your family, and be you yourself a friend, as I shall be, and am,

Your sincerely attached

HANS CHRISTIAN ANDERSEN.

The "excellent young man Mr. Durham" has since risen to be the eminent sculptor, and member of the Royal Academy, to which distinction his busts of Hans Andersen and of Jenny Lind were admirable stepping-stones to pave the way.

Of Andersen's second visit to London, though the novelty had worn off, much might be written; but I have already for the present filled my space, and have to bid my dearly valued friend farewell.

* Poor Sir George Pollock had returned, laden with laurels, from the India he had redeemed by his daring and glorious march through the Khyber Pass to Afghanistan, and had not yet recovered from his warring labours and responsibilities. He is now healthily and happily enjoying the highest Indian honours he so nobly won; and how cheering must be the reflection of our youthful friends, that by their own conduct the respected chief citizen of London, and the victorious general, had raised themselves from the ranks. Sir P. Laurie had been a saddler in the employment of Her Majesty's saddler, Mr. Pollock, King's Mews, Charing Cross, when George his son was a young boy!

† Further praises, in anticipation of meeting, though extremely characteristic of the writer, are omitted.

THE LEISURE HOUR.

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Corper.*

THE OLD LOCKET.

THE MORTONS OF MORTON HALL.

BY THE AUTHOR OF "THE GREAT VAN BROEK PROPERTY."

CHAPTER XVI.—TELLS HOW HENRY TALBOT MET WITH AN OLD SCHOOLFELLOW, AND WHAT CAME OF THE MEETING.

FOUR days after Henry Talbot's abrupt departure from St. David, Mary received the expected letter which announced that he had reached London in safety and in time to embark on board the American packet-ship Amazon, which was to "haul out" of the West India Dock on the following morning. It was therefore with a mingled feeling of surprise and dread that she received

a second letter a few days later, bearing the London post-mark, and directed in her brother's well-known handwriting.

"What can have happened?" she thought to herself. "Has Henry lost his passage after all?" The handwriting, clear and firm, forbade the supposition that her brother was ill—at all events so ill as necessarily to prevent him from embarking, and a feeling of gladness, for which she blamed herself, crossed her mind as she thought that the ship must have sailed without him.

"It is wrong," she thought, "for me to wish that Henry has met with disappointment, and forfeited his

passage-money, and—at least until the Amazon returns to London—has lost his outfit and all his effects; and yet, if the mishap would only induce him to remain in England I could not regret it. He could take the little store of money I possess, and make all right again. I wonder what *has* happened.”

While the young lady was thus puzzling her brains to conceive the reason wherefore her brother had not already sailed for America—for that very morning Miss Wardour had brought her a newspaper just arrived from London, which announced the fact that the Amazon *had* sailed on her voyage—she might easily have ascertained all she wished to learn by simply breaking the seal and reading the contents of the letter. But, like the majority of persons who have not a large correspondence, who receive a letter they have not expected, or one which they fear may contain disagreeable tidings, she turned it about in her hands, and examined the superscription in various lights, as though, through some mesmeric influence, she could thus acquire an inkling of its contents.

At length, however, the seal was broken with trembling fingers, and the mystery disclosed.

Thus Henry had written—

“Hammersmith, September 10th, 18—.

“MY DEAR SISTER—You will doubtless be surprised when you receive this lengthy epistle, which is penned at old Mrs. Margaret’s snug little cottage at Hammersmith.

“The Amazon duly sailed from London on the appointed day; and now I fancy I hear you say, ‘Henry has lost his passage, and I really am not much grieved at it.’ (I don’t really think the loss *would* grieve you very much). No such misfortune, my little sister, has occurred. The Amazon sailed from London on the morning after my arrival from St. David, it is true, but, luckily, I called very early in the morning at the Jerusalem Coffee-House, and saw Captain Dobson.

“‘So you received my letter, and have come up to go on board the ship, young gentleman,’ quoth the captain.

“‘Yes,’ I replied, ‘and greatly to my disappointment. I expected to remain three days longer with my sister.’

“‘Waal now, I hardly thought you’d come up,’ continued the captain; ‘but as you wished me to write you when the ship was about to haul out of dock, I dropped you a line, ’cording to promise.’

“‘You thought I’d forfeit my passage-money, did you?’ said I, ‘or did you think I’d swim off on board as the vessel sailed past the coast?’

“‘Now, I reckon you think yourself uncommon spry,’ returned the captain; ‘but I didn’t think nothing of the kind. I thought, though, you’d join the ship at Southampton, where she’ll remain a week, to receive freight and passengers. I shall join her there myself. You must be uncommon fond of being on shipboard.’

“‘Remain at Southampton a week to receive freight and passengers!’ said I, somewhat nettled, I can tell you, to think that I’d torn myself away from St. David in such an unpleasant manner, and under such disagreeable circumstances, to come all the way to London, and pass an unnecessary fortnight (between the British Channel and Southampton together), on board ship; besides putting myself to needless expense, when I might have remained quietly in the village. ‘Why didn’t you mention in your letter that such was to be the case? Why, in fact, did not you tell me that the ship would put into Southampton when I paid my passage?’

“‘As to telling you when you paid your passage-

money,’ replied the captain, ‘I didn’t know of it myself till a week ago. I thought to sail right away from London as usual. And as to writin’ a long rigmarole in my letter, you must think a shipmaster has precious little to do, specially when you might have seen for yourself, if you’d sarched the noospapers. ‘Ta’n’t every captain as ’ud have writ at all; but I promised, and I kep’ my word; though, if you’d have staid where you were, I’d have saved feedin’ ye for a fortnight.’

“‘But I’m not obliged to join the ship *now*?’ I put in.

“‘Not by no manner o’ means,’ returned the captain. ‘You’re safe enow for another fortnight, good, if you’re a mind to go back ag’in, and you’ll see in the papers when the ship’s goin’ to sail from Southampton.’

“‘Then I go back, I assure you,’ said I. ‘I have no wish to be cooped up on shipboard in the Channel, and in Southampton, when I can be free on shore.’

“‘Very good, youngster,’ replied the captain. ‘I reckon you’re wise myself. On’y don’t say as I ha’n’t done my dooty to’ards ye. And now, since you’ll save me boarding you a fortnight, suppose you just bring yourself to an anchor, and take breakfast along with me? I’m just a goin’ to sot to.’

“So Captain Dobson and I sat down to a capital breakfast together, excellent friends; and, when breakfast was over, the captain shook hands with me, and told me he hoped to welcome me, ‘all right and spry,’ on board the Amazon at Southampton, that day fortnight.

“Now, my dear Mary, you’ll be saying, ‘Why didn’t Henry come back to St. David immediately?’

‘I’ll tell you why. While roaming through St. James’s Park, that same afternoon, I met an old school-fellow, who has recently come of age. He was a minor, and has just stepped into a large fortune and a baronetcy, and he positively insisted that I should run down with him to his seat in Kent, and spend a day or two. I refused; but he pressed me so earnestly (and he belonged to the same form with me at Eton), that at last I consented, and a lucky visit it has turned out to be to me. But I’ll tell you all about *that* when I see you. I have but just returned from Kent, and have run down here to see old Mrs. Margaret, who sends all manner of good wishes and blessings, and has loaded me with kind messages for you.

“To-night I shall start for Falmouth, and to-morrow night I hope to be with you again.

“Until then, when I shall have a week to remain at St. David, believe me,

“Sincerely your affectionate brother,

“HENRY.

“P.S.—I was rejoiced to learn from your letter that poor Mr. Aston has partially recovered consciousness, though I am sorry to hear that Doctor Pendriggen fears that a long time must elapse ere he will perfectly recover his health. H. T.”

Mary Talbot was alike surprised and delighted on reading the contents of her brother’s letter; though she could not very easily forgive him for spending two or three days of his brief respite even with an old Eton schoolfellow.

However, Henry arrived at the farmhouse the next evening, shortly after dark, and was rapturously welcomed by his expectant sister, who in her gladness forgot to scold him for his brief truancy.

The first question put by the young man, after an interchange of brotherly and sisterly greetings, was respecting the condition of Mr. Aston.

“He is still *very* ill,” replied Mary, “though Doctor

Pendriggen says he is improving as fast as he can expect; and the doctor believes that, in course of time, he will perfectly recover his health. But the shock to his system was a severe one. The doctor says he must have been in a state of great nervous excitement when he was seized with the fit, and that he was probably endeavouring to overcome this excitement. You now may be able to explain something about it. As yet he has not spoken a word himself. Poor gentleman! I am very sorry for him. I like him very much, and he has behaved in such a kind, almost fatherly manner to me, and to you too, Henry. I should so like to see him; but as yet, no one except the doctor and the nurses may enter his room."

"Then I cannot see him?"

"I fear not, Henry. I doubt whether he would recognise you. His mind sometimes wanders throughout the whole day, although he has occasional glimpses of consciousness."

"Then he has not yet been able to explain anything about the attack?"

"No. We know nothing more than what I learnt from you, and what the fishermen who brought him home have told us."

"Well, I'm sure I sincerely hope he will recover, although I should not care to see him myself, until you have had an opportunity to explain to him the circumstances which compelled me to leave him in such an apparently careless, unfeeling manner."

"Was there any cause for excitement, Henry? Did you remark anything strange in his manner previous to the attack? Surely there had been no quarrel with any one? He had had no words with you?"

"On the contrary, Mary, he had been unusually kind in his manner and conversation, and we did not meet a soul until he was suddenly struck down. Still, I did fancy there was something strange—something peculiar in his conversation that morning."

"We talked chiefly about America, and about his children, to whom he was to give me letters of introduction that he had written, he said, the night before."

"But he spoke like a man who has something on his mind which he wishes to disclose, and who yet scarcely knows how to introduce the topic. Sometimes his voice and manner were really affectionate."

"Poor gentleman! Depend upon it, Henry dear, I will explain to him fully the cause of your quitting him, and all of us, so abruptly, as soon as I have an opportunity; and possibly, before you leave me again, he may so far recover that you may be admitted to him, and bid him good-bye."

"But now, Henry, about yourself. Who is this old schoolfellow whom you have visited, and for whom you could spare three whole days from your sister?"

"I don't recollect hearing you speak of any very particular favourite at Eton, though I suppose all boys have their chosen friends. And what has been the good fortune you met with? You wrote that you had a story to tell me, and I am all impatience to hear it. You know that women are naturally curious. Now, sir, please to explain your delinquency. What kept you so long in London?"

"Too many questions at once, Mary," replied Henry. "I shall begin by exciting your curiosity still further, and perhaps by exciting your cupidity also;" and, drawing forth a new pocket-book, the young man took from it four brand new crisp Bank of England notes for fifty pounds each, and spread them open upon the table before his sister's wondering eyes.

"What is the meaning of this, Henry dear!" ex-

claimed Mary. "Where did you get so much money from? It is not your own?"

"It is my own, Mary," replied the young man, enjoying the amazement of his sister. "My own, at all events, to make what use of I please, until I am in a position to repay it—without inconvenience."

"Under no other conditions would I accept the money."

"Henry dear," said Mary, gently, and placing her hand on her brother's shoulder, "do you not remember that dear mamma begged us never to involve ourselves in debt willingly, or to an amount that we had no prospect of being enabled to repay? You would not borrow of *me* what would have been no loan, but a free gift."

"Because if I were starving I could not rob you of your little pittance, Mary. But, as to this money. It is a loan. Had I willed it, it might have been a free gift—twice as much, if I would have accepted it. I refused even to borrow, until the old schoolfellow of whom I wrote, and who is the owner of a vast fortune—to whom this sum is in fact a mere bagatelle—was angry at my refusal. He urged me, pressed me to accept the loan, wanted to make it five hundred pounds, and at length I felt almost obliged to accept it. 'I shall never be able to repay you,' I said. 'I shall never ask you to do so,' he replied; and at length, as I have said, perceiving that he was hurt at my obstinate refusal, I consented, feeling that the money would really be of service to me. But I accepted it on the express condition that I was to repay it as soon as I was really able; but that—this *he* insisted upon—I was not to think of repaying it until I could do so without inconvenience to myself."

"And who is this generous friend who has shown so much kindness to my brother?" inquired Mary, placing one hand again upon the young man's shoulder, while she passed the other fondly across his brow.

"That is a secret I am bound not to disclose even to you, Mary."

"A secret! why a secret, Henry?"

"Oh, there's no mystery—nothing wrong—nothing that I need to be ashamed of, unless it be a crime to be poor, and to accept a favour from a friend," replied Henry, smiling at his sister's amazement.

"You need not look as if you thought I had been an accomplice in some terrible crime," he went on, "or had received a reward for wrong doing. The secret, dear Mary, is simply this. When at length I consented to accept the loan, I said—

"There is not another person in the world who would act so generously, old fellow; and I don't know that I would lay myself under an obligation to any other—"

"Not even to your sister," put in Mary, reproachfully.

"Not to my sister, when by so doing I should deprive her of her little all," replied Henry. "But to my story—

"Don't speak of it, then," said my schoolfellow. 'Never allude to it under any circumstances, to me nor to any other person, or I shall think you are pained at the thought, and that you don't regard me as a friend. Promise that you will never mention to any living creature that you have gratified me by permitting me to help you with such a trifle.'

"And I did promise."

"Arthur," I said, 'I must tell my sister that a friend has assisted me with a loan; but even to her I will not mention that friend's name, until I am able to repay the money. Then I shall introduce you to my sister, and

say, 'Mary, this is the friend to whom I am indebted for the loan which has enabled me to help myself forward in the world.'

"For, to tell you the truth, Mary," continued the young man, "though I spoke lightly of it, I *have* thought at times, that, in case of any unforeseen accident or delay at New Orleans, I might find myself awkwardly situated."

"At least tell me where your friend—Arthur, resides," said Mary.

"Ah!" cried Henry, with a laugh, "I have, I find, unwittingly spoken of my old schoolfellow by his Christian name. "Now, you would have me say where he lives, and then your curiosity would lead you to hunt up some county directory, until, between the Christian name and the residence, you succeed in discovering the secret—eh?"

Mary smiled in reply, and Henry went on—

"I didn't forget *you*, Mary, though in truth, in my hurry I came near doing so. I have got a little present for you."

"For me, Henry dear?"

"Yes, for *you*—a keepsake."

"I shall need none, Henry, to keep you in my memory."

"Nevertheless, I have purchased one, and here it is."

Taking a small parcel from his pocket, Henry opened it, and displayed—carefully wrapped in floss cotton and tissue-paper—a slender gold chain, to which a small but heavy and beautifully chased gold locket was appended.

"Oh, how beautiful!" exclaimed Mary, with a natural feminine admiration of such costly ornaments, as her brother held the chain and locket to the light. "How *very* beautiful! But you should not have spent so much money as those trinkets must have cost you, upon me, dear," she added. "It is very extravagant; and then it would ill beseem me to wear such a costly ornament here, at St. David, and in my present position."

"Why not? At any rate you can keep it until you *are* in a position to wear it, which time, I trust, will not be long in coming. Or you can wear it without exposing it to view. However, as I just now hinted, it was by mere chance that I came to buy it. Touch the spring, Mary."

The locket flew open at a touch of the spring, and disclosed inside a miniature portrait, beautifully painted on ivory, of a little girl of ten or twelve years of age.

"Ah!" exclaimed Mary, "that *is* pretty; but, Henry, what does it mean?" and the young lady glanced at her brother with a look of surprise and perplexity.

"You recognise the portrait, then?" said Henry.

"It is very like the miniature portrait of mamma when she was a little girl—the miniature that poor papa took to sea with him on his last voyage."

"It is very like *yourself*, Mary, when *you* were a few years younger. In fact, it resembles you *now*. Any one would perceive the resemblance."

"The miniature I speak of was said to be very like me, Henry. But what does it mean?"

"The portrait? It means, unless I am very much mistaken, that that locket, which, as you perceive, is of massive gold and old-fashioned workmanship, was once in mamma's family. I do not speak from the miniature alone. That may be but a singular coincidence. Sometimes people do greatly resemble each other. But look at the locket itself. You remember papa's gold seal, that was given to him by mamma soon after they were married, with her father's motto and crest engraved

upon it? And you recollect the coat-of-arms and seal in mamma's Bible, that she had kept from the time of her childhood?"

"Yes, perfectly well, Henry."

"Well, then, look at the outside case of the locket, and you will see that the crest and motto are the same. There is the shield with the same quarterings, containing two daggers and two stars, surmounted by a griffin, and in a scroll beneath, the motto of the Mortons—

'Aut viam inveniam, aut faciam.'

You remember mamma often saying how proud our uncle Charles—whom we never knew, and who was slain at the siege of Gibraltar—was of the motto?"

"Yes—it means—I have almost forgotten——"

"It means, 'I will either find my way or make it.' Poor uncle Charles! He fought *his* way to a glorious death, as it is called, at Gibraltar, and the rest of the Mortons have found their way to the grave. Well, I shall adopt the motto *now*, and we shall see if it be not to me a brighter omen. But to the locket in question.

"I saw it—open—exposed for sale in the window of a jeweller's shop, and the striking resemblance of the miniature to that of which we have just spoken, and to mamma and yourself, Mary, induced me to enter the shop and inquire the price of the trinket. No sooner, however, had the jeweller handed it to me, that I might examine the portrait more closely, than I immediately recognised the motto and crest. I was determined now to possess it, and again I asked the price.

"'It is very solid and heavy, sir,' replied the shopman; 'heavier than they make these articles nowadays. The price is seven guineas, and that is little more than the value of the gold, which is very fine. It weighs nearly two ounces.'

"It was a high price. Still I thought, 'it *is* gold, and will always fetch nearly its value,' so I paid the man his price, and then he suggested that—as I probably intended it as a present to a lady—it needed a gold chain. Then I thought it would do as an ornament for you; so I selected a chain, for which I paid five guineas—twelve guineas in all; so don't say that it is a paltry gift."

"It is far too costly a gift, Henry. But if it really once belonged to mamma, or grandmamma, more likely——"

"You're glad to possess it as an heirloom? So am I. I do not doubt that it once belonged to the Mortons, Mary. The crest and motto of no other family would exactly resemble theirs.

"When I had fairly secured my purchase, I told the shopman that the crest and motto were those of my grandfather Morton, and asked him how he became possessed of the locket. He hesitated, and seemed not to care to tell me. At length, when I pressed him closely, he said he had purchased it of a stranger, who looked like a gentleman's servant, and who told him (the jeweller) that it belonged to his wife, who had been a lady's maid, and that it had been given to her by her mistress. The man added that he and his wife were compelled to sell it against their will, through the pressure of poverty, both being out of employment. I should have endeavoured to learn more, but some ladies entered the shop, and, being in a hurry, I came away."

Various surmises were made by both the brother and sister as to the way in which the trinket, if it really, as they did not doubt, once belonged to the Mortons, had come into the jeweller's possession—of course, to no purpose; and at length, after having been again admired by

Mary, it was carefully wrapped up and put away in the drawer of the young lady's writing-desk.

Henry and his sister sat chatting over family and other affairs until a late hour, and then they bade each other good night, and retired to their respective chambers.

"You must have spent all your money, Henry, with the exception of your friend's generous loan—all the money you had in your possession when you left St. David, I mean—between the cost of your journey and the price of the locket and chain," said Mary Talbot to her brother the next morning.

"Not all," replied Henry; "I have still a few guineas left. I was very careful in London, I assure you, until I met with my lucky adventure. Now I have the four new fifty pound notes intact, besides the loose gold, none of which I need to spend until I set out for Southampton."

"Because," continued Mary, "if you *should* need money, it would be a pity to change the notes until you arrive in America, and—I—"

"Could supply me with money, you want to say. You are really very anxious to persuade me to dispossess you of your spare cash, sister mine; but, really and truly, there is no need of any such generosity and self-sacrifice on your part;" and Henry again proudly displayed his crisp Bank of England notes.

Satisfied on this score, Mary made no further attempt to force her money on her brother's acceptance, and while she went forth on her daily duties Henry renewed his acquaintance with his former friends, and apologised for his abrupt departure without even bidding them good-bye.

A week soon slipped away, and the day came round when Henry Talbot was to set sail for Southampton to join Captain Dobson, and embark on board the packet-ship Amazon.

Before he quitted St. David on this occasion, however, he bade farewell, individually, to all his friends, with the exception of him who had, on his previous visit, shown him more kindness and attention than all the rest.

Poor Mr. Aston was still confined to his bed, and still Doctor Pendriggen would allow none but the hired nurses from the Falmouth Hospital to enter the sick chamber. The invalid was, however, rapidly improving; but he had sunk so low that the doctor was fearful, until his patient grew stronger, of the effect upon him of the slightest excitement. So Henry was compelled to leave it to Mary to explain, whenever Mr. Aston should be in a condition to listen to her, the urgent reasons which had induced him to leave St. David so hurriedly, and to part from one who had shown him so much kindness at such a critical moment.

Mary Talbot accompanied her brother to Southampton, and took her latest farewell of him—for she knew not how long, nor whether it might not be for ever—on board the ship.

She stood on the quay late into the evening twilight, watching the vessel as it slowly sailed down channel before the faint autumnal breeze, until the hull at length disappeared from her view, and she saw but the shadowy sails; and at length, when they too had disappeared, she returned slowly and sadly to the hotel at which she had engaged a room for the night.

The second parting seemed to her more sorrowful than the first, when Henry had hastily bade her good-bye, and left no time for thought, and grief, and tears. She had then sorrowed after he had gone, when she returned to her lodgings at night and missed his

cheerful greeting; but now she had anticipated his departure, and had grieved while he was still with her, dreading the parting moment.

That night, before she retired to rest, she prayed long and earnestly for her brother's spiritual and temporal welfare. But though she strove to comfort herself with the thought that the same gracious Providence that had watched over him on his native shores from the days of his infancy, could equally as well guide and protect him over the waters of the deep, and in a foreign and far-distant land, it was long before she could compose herself to sleep; and even then, when sleep closed her eyelids, her slumbers were broken and troubled by uneasy dreams, and she rose in the morning unrefreshed, and possessed with a sense of indescribable loneliness.

That day she returned to St. David; but though the rector and Miss Wardour, and her other friends—compassionating her, and sympathizing with her natural grief—redoubled their kindness towards her, a long time elapsed before she recovered her former cheerfulness.

Are there such things as presentiments, forewarnings, as it were, of forthcoming trouble or peril? Or are those forebodings which most of us have experienced at some period of our lives, and which we have believed to have been subsequently realised, simply caused by some peculiar position of attending circumstances, or by events, trivial perchance, and perhaps apparently disregarded at the moment, which have yet lingered in our memory, and, affected by certain conditions, have brought about the evil which we have mysteriously dreaded? Providence has wisely and mercifully veiled the future from our eyes. It is well for us that we know not what is to befall us, either for good or evil. Yet, if trouble be brought about through attendant circumstances, it is possible that by dwelling upon or brooding, unconsciously perhaps, over these circumstances, certain results may be foreshadowed in our minds, which, when eventually they come to pass, lead us to believe that we had a presentiment of their forthcoming; while, if nothing occur to cause us uneasiness, the circumstances and the fancied presentiment of forthcoming evil are alike forgotten.

Mary Talbot, after her brother's departure, felt her spirits depressed by a dread of some impending trouble. Whence it would arise, or what form it would assume, she could not conceive, and in her brighter moments she struggled hard to shake off these—as she then regarded them—idle, foolish fears; but her efforts were in vain. The shadow loomed larger and darker, and day by day seemed to be drawing nearer, until at length, in her case, the presentiment of impending evil was verified—the trouble she had dreaded came upon her.

THE MONEY MARKET.

To the vast majority of English men and women outside the commercial circle, the Money Market is a mysterious intangible something, of which they have no definite conception. Though they see it figuring in the columns of the newspaper whenever they take one in hand, if you were to ask them "What is the Money Market?" or "Where is the Money Market?" most of them would be puzzled to answer. Perhaps some would refer it to the Stock Exchange, and some to the Bank of England, while the idea of others would be that it was connected with the change-houses and bullion-shops where they see the big piles of notes and bowls full of gold displayed in the barricaded windows in Lombard Street and the neighbourhood. For the benefit of readers

who entertain such indefinite notions, we shall jot down a few sentences concerning the Money Market, not with any intention of treating the matter fully—for to do that would require a pretty large volume—but with the view of giving them some elemental knowledge of a subject fraught with interest, and a knowledge of which may lead to a right understanding of matters with which it has not always an obvious connection—matters, for instance, of history or of home politics.

The Money Market, then, has no visible existence, and, of course, cannot have any definite locality. It may be said to exist only in the imagination; for it is impossible to point it out and say "Here it is," or "There it is." People may suppose that it lives somewhere in the atmosphere of Threadneedle Street, the Exchange, in Lombard Street; but such a supposition would be fanciful, and, if not absolutely false, yet infinitely wide of the truth. The truth is that the Money Market is everywhere, and it has been well compared to the principle of life in the human body, active in all the members but having its seat in the heart; for the Money Market is the circulating system of the whole material organisation of society—its controlling masses being in London, but the channels through which sensation and vitality are received and transmitted, ramifying in all conceivable directions, and spreading out through all parts of the kingdom. Many people belong to it all unconsciously to themselves, for it includes all who are lenders or borrowers of money, from the contractors of a national loan of millions to the thrifty lass who deposits her savings in the Post-office Savings Bank. The central force is the Bank of England, which at times has the power to retard and suspend the action of all the other forces, and will exercise that power if necessary. The City private banks come next, who, by virtue of the familiar combination that exists among them, and their common clearing-house, may be regarded as one institution. Then come the numerous joint-stock banks, whose number has much increased of late years, and whose deposits, amounting to many millions, have more than doubled within the last decade. After the City banks come the City brokers, men whose establishments consist perhaps of a single up-stairs room, who make no show and court no observance, but not a few of whom, nevertheless, are the possessors of immense wealth, won for the most part by the exercise of a talent peculiar to themselves. They affect a class of business about which bankers care little; they know everybody from whom it is possible to borrow, and to whom it is safe to lend, and are thoroughly posted up in everything that has the remotest practical relation to money. They have the faculty of reading men's faces, and can get at the financial predicaments of a borrower through the quiver of his lip or the unsteady glance of his eye. They are said, figuratively, to know a bad bill by the *feel* of it, and to be able to scent the taint of insolvency miles off, snuffing it in the air. From their intimate knowledge they are able to engage in transactions which a banker would refuse, and would not, indeed, be justified in accepting. They calculate risks to a hair's-breadth, and regulate their terms accordingly, and, confident in the security their system guarantees them, will extend their accommodations to the utmost limits of prudence.

A different section of the Money Market are the bankers of the West-end, old firms some of them, who date their origin back to the time of Charles II. These are the bankers of the aristocracy, the peers, and the landed gentry; they do not dabble much in speculation, do not offer sliding-scale interest on deposits, and can keep themselves perfectly comfortable in times of panic,

without sending delegations to the Chancellor of the Exchequer. Kindred with these, though of a more humble rank, are the provincial bankers of the market towns and rural districts—warm men, with well-furnished pockets, well acquainted with the fiscal liabilities of the gentry around them, and seldom averse to advancing a good solid sum in mortgage upon the "dirty acres," every tree and hedge-row on which have been familiar to them for years. The provinces also have their joint-stock banks, many of which have stood the test of severe trial and bravely weathered the storms under which they were expected to succumb. The farthest from London, but more than rivalling the London bankers in the soundness of their theories and in their practical skill, are the bankers of Scotland—men who justly pride themselves upon carrying out a system of banking which has not its equal in the world—a system which has been worked for a hundred and twenty years together, with the rare occurrence of anything like run or panic, and the still rarer occurrence of loss to the shareholders. The Scotch banking system is admitted to be the strongest in existence; but it is said to be peculiar to the Scotch people, and not transplantable to an alien soil. Last to be mentioned as lying within the domain of the Money Market are the banks of Ireland, which on the whole have been extremely well conducted and bear a high character. The Bank of Ireland, managed much after the system of the Bank of England, occupies the noble building in Dublin which was the Parliament House when Ireland had a Parliament. It is to Ireland what the Bank of England is to this country—steadfast to all its engagements, and ever faithful to its trust. The Irish joint-stock banks have also been of signal service to the country, in developing its industry, and, with a single exception only, have suffered no taint of discredit.

All this multitude of banks, scattered throughout the United Kingdom, may be considered as forming one system; because, in the first place, all of them are under the frequent necessity of making payments in London, which they do by commissioning their agents, by letter, to make such payments; and in the second place, all are occasionally liable to the need of accommodation which only the London banker or broker could afford them. Paying by correspondence, instead of by sending the cash, is the grand medium by which modern commerce is facilitated and accelerated: it is said to have been derived from the Jews of the Middle Ages, who by its means were able to baffle the designs of marauders and the hatred of priests and kings; but the plan did not originate with the Jews, who are supposed to have derived it from the money-dealers of India, where it has been in operation from time immemorial. With us it has long been naturalised, and has been worked in every practicable way, its last and most popular phase being the system of post-office orders, which may be said to be the banking of the people.

As London is the great centre of the Money Market, it will be evident that the tendency of all balances not wanted in the country is to flow up to London, because country bankers will seek to make a profit of their surplus by putting it out to interest, while private investors are willing to do the same; and neither of them, as a rule, can have recourse to any other quarter, seeing that the London Stock Exchange is the regular mart for stock of every description. If the flow of money into the market were uniform and regular, the distribution of it could be so systematised as to prevent any great scarcity or over-abundance; but it is not so, being, on the contrary, exceedingly fluctuating and uncertain. One result of this irregularity shows itself in occasional gluts

of money in the hands of London money-dealers, and such gluts, if they are continuous, are apt to lead to reckless speculation, culminating in panic and ruin to thousands. For there are always a host of speculators who will borrow cash on almost any terms, and embark in any venture, however rash or unprincipled, and who will contrive to make a gain out of it by the loss of others. When money is scarce and stocks are low, such speculators would not be listened to, and they keep in the background; but in seasons of glut they come forward with their specious projects and grand and delusive promises; and then that section of the silly public which is always ready to be devoured rushes to the lure like the moth to the flame, and, in the foolish expectation of twenty per cent., parts with its capital, never to touch it again. One would think there were always investments enough open to those who have savings to place out, without having recourse to new ventures; and so indeed there are, as a glance at the Share-list will show. Every morning's "Times" gives a catalogue of from four to five hundred different ventures in which a man may embark his capital if he chooses, but none of these ventures have the dazzling aspect of the speculator's bubble; and though some of these shares may be had cheap enough, supposing they paid a dividend, there may be the ugly fact with regard to them, that they do not pay any dividend at all. A little study of the Share-list, with a reference to the rates of dividend, will serve to show the justice of the Duke of Wellington's maxim, that "high interest means bad security." The student will see that Consols, at the average at which they have sold for some years past, pay but three and a quarter per cent.; that railway shares in the aggregate pay no more than four; and that our colonial Government securities oscillate between five and six. He knows that of these the only infallible security is the Consols; that the security afforded by railways, though based on solid property, is not so firm, and that colonial security, assuming it to be unimpeachable in all respects, is at least liable to be shaken, perhaps shattered to pieces, in the event of a general war. If he look further he may find shares that have paid and are yet paying their seven and eight per cent. and even more, but he will find on examination that their high dividends are compensated by risks proportionately high; and he would be pretty sure to find, if he could get at the truth, that those who buy them seldom keep them long—regarding their transactions in such wares rather as speculations than investments.

Assuming that the reader has now gathered some idea of what is meant by the "Money Market," we will turn our attention to this morning's paper, and see what further light the money article will afford us. The first sentence tells us that Consols drooped a little, and left off one-eighth lower than yesterday, the cause being some anxiety concerning affairs on the continent. Then we are told of depression in the railway market, and certain lines are mentioned as having fallen rather heavily. Then comes a special feature in to-day's market, a serious fall in the Royal Mail Steam Company's shares, on intelligence of the disastrous hurricane at St. Thomas, by which four steamers were lost and others damaged. The shares, says the report, were done to-day as low as 65, but rallied a little, and closed at 65 to 70—a fall of more than £8 below the quotations of yesterday. The next paragraph tells us that there has been an increase in the demand for discount, and the rates have tended upwards. Then there is an extract from the Bank return for the past week, showing that the bullion has been reduced so much, the reserve of notes

so much, that other securities have fallen off so much, and private balances have diminished so much. Then follows an account of stocks of all kinds, showing the prices at which they stood after the business of the day was over, and the fluctuations, if any, which they underwent during the day, in the following order:—Consols, Foreign Stock, English Railway Shares, Foreign ditto, Colonial Railways, Colonial Government Bonds, American Securities, Miscellaneous Securities, and Bank Shares. To the above may be added the latest quotations from the continent, through Reuter's telegraph, comprising accounts of operations in the money-markets of Paris, Amsterdam, Hamburg, Frankfort, Berlin, and Vienna. Once a week the money article contains also the Bank return for the week, showing the state of its issue department and banking department, and comparing the business done with the business of the week preceding. Every kind of intelligence which has a practical bearing on commerce and money-dealing may be also looked for in the money article—such as the failures of great firms, the loss of vessels at sea richly laden, financial schemes at home or abroad, insurrections in continental states, etc., etc. Appended to the money article is the Share-list, containing from four to five hundred different stocks, and showing the prices at which they all stood at the close of the day's business.

Now let us look at some of these items, and note how their publication is calculated to be useful. The first item is to the effect that Consols are falling in value; then, if you wanted to sell Consols, it might be wiser for you to wait a day or two until they had risen again; or if you wanted to buy, it might be prudent to buy at once, before they rise again. The second item tells of certain railway lines which have fallen heavily; then, if you happen to have confidence in these lines, or any of them, and feel that your confidence is well founded, you may do a good stroke of business by purchasing as many shares as you can while the depression continues, and selling them again when they rally and recover their value. The third item is that sad account of the disaster at St. Thomas, which has cast down the shares of the Royal Mail Steam Company; then, if you had been alert when that news came and produced its first depressing effect, you might have made a good thing by buying up shares at the depression price and selling them again, perhaps on the same day, when they rose to their just level. The fourth item records an increase in the demand for discount; then, if you are a money-lender you can increase your rate of discount, and if you are a borrower you know that you will have to borrow at a higher rate, whether you do business with the Bank or with any one else. The fifth item tells of a reduction in the bullion, the resources, etc., of the Bank, and you will know if that reduction goes on that the Bank will have to contract its issues, and you may calculate how far that may affect you, either as a borrower or a lender.

But we need not pursue this examination further. We see now that there is not, there cannot be, an atom of intelligence set down, either in the money article or in the tabulated Share-list, which is not calculated to be interesting to somebody. Indeed, it is a question whether these financial columns are not more studied every day in the year than any other portion of the newspaper. Of the upper, middle, and professional classes—the classes who find the morning paper on their breakfast-tables—a very large proportion are given to speculation in stock or shares to a greater or less extent, at some time or other. To many of them the Share-list, dry and repulsive as it looks to the ordinary

reader, presents the most startling details—the minute figures and fractions, when read by the light of experience, being far more eloquent than the tropes of rhetoric, and fraught with the evidence, now of enormous gains, now of the most frightful loss and domestic ruin. Any man conversant with the history of the Money Market for the last dozen years, needs but to glance down the Share-list of to-day, to discover the source of many a rich man's wealth, and of many a poor man's poverty. When he sees shares which were once at a premium of ninety or a hundred per cent. now quoted at a discount, he knows what that means; he knows that the difference between the paltry values now registered and the excessive values of a past period—a difference representing vast sums—has all gone into the pockets of the knowing ones, and out of the pockets of the simple, leaving their “larders lean and cellars dry.” Not that people consult the money article to moralise over it. Nothing of the sort. The shareholder looks into it to see whether his shares have risen or fallen, whether he is worth more to-day than he was yesterday, or is worth less. He likes to see his investments going up, even though he has no thought of selling, and it annoys him to see them going down. If he have a little cash to place out, he will run over the list to see how certain shares stand, and perhaps, if he likes the look of them, he will write to his broker and commission him to buy a certain number. Or perhaps he sees that certain shares he holds have gone up to a point which will pay him a good profit on their original cost; and, having reason to think they will go no higher, he sells them out at once and secures the profit. Stockbrokers may examine the list as a guide to their transactions. Perhaps they have commissions standing over to buy in or sell out such or such securities when they touch a certain point, and they do buy or sell accordingly, when that point is reached; or, having no such commissions, they do business on their own account, when, judging from experience, they infer from the state of prices that it may be done advantageously. In short, everybody at all interested peruses the list from an interested standpoint, and acts, or refrains from acting, according to the view each takes of the information it affords. In a country like ours, where commerce is all in all, the mutations of the Money Market are of paramount import, not to money-dealers only, but to every department of trade, and to the workers in all descriptions of industry. Some trades stop altogether when money is what is called “tight,” that is, procurable only at a high rate of discount; and it happens again and again that thousands are thrown out of employ when money is at eight or nine per cent., who would be in constant work if the rate could be maintained at anything below five. Meanwhile, it must be evident that, even to the industrious classes, who can have no personal interest in the rise and fall of the values of securities, the publication of the money article is a boon, inasmuch as its tendency is to shed a light on all kinds of monetary transactions—to place hindrances in the path of underhand dealers—to give timely warnings by casting the shadows of coming events on the dial-plate of to-day—and to promote free trade in money.

ROBERT GROSTESTE.

ONE hundred and fifty years before Wickliffe protested against the authority of the popes and the temporalities of the Roman church, and upheld that the common people should be instructed out of the Holy Scriptures,

a prelate sitting in the see of Lincoln had done the same. His name deserves one of the loftiest niches among the noble band of worthies who have been called “Reformers before the Reformation.” Not unlike Wickliffe in character, in steadfastness, and in some of the circumstances of his life, both had the same peaceful death, surrounded by faithful friends, despite the ravings of fierce enemies who would have longed to burn them; both were honoured by a papal rescript ordering the disinterment and destruction of their mortal remains. But the good they had done lived after them, immortal as their faithful and steadfast souls.

Robert Grosteste, Bishop of Lincoln, was of mean descent, born at Stradbroke in Suffolk, about the year 1175. When he was charged with his obscure parentage in after life—for even in the reign of the second Henry, plebeian birth could be taunted as a crime—Grosteste was wont frankly to acknowledge and in nowise to extenuate the charge. Yet what a dead level of the forgotten do all the Norman-blooded of the age, except a handful of names, appear to us of the nineteenth century! His name, it may be remarked, was merely a Christian name, Robert: the affix was given him at Paris, after the manner of the times, either from a personal peculiarity, (it signifies “greathead”), or from admiration of his uncommon mental capacity. His contemporaries, in writing of him, style him simply Robert, or Bishop Robert.

The earliest picture we have of his life is a touching one. A friendless boy, begging about the streets of Lincoln, he chanced to come to the door of the mayor. Here was the turning-point for Grosteste, as for a certain little Luther some three hundred years afterwards, standing before the house of the burgher Cotta. The good mayor speaks to the little mendicant, is charmed with the child's artless story, takes him up as a *protégé*, and puts him to school.

Thenceforth we find Robert always a student. In due time he went to Oxford, and made the fullest use of all the advantages of that seat of learning. He studied the Greek language, and became an excellent proficient therein, while it was almost unknown throughout Europe, and rarely heard of in the universities. His tutor was called Nicholas the Greek, being one by nation: a man of fortune, who attached himself warmly to his clever pupil, and went with him subsequently to Paris.

Grosteste learned Hebrew from Jews living in the Jewry at Oxford. Both these acquirements brought him face to face with Scripture, and helped him to the consummate knowledge of theology ascribed to him. If we are to believe his admiring contemporaries, the young Oxonian knew well-nigh everything—“logic, ethics, economics, the branches of natural philosophy then known, such as the doctrine of the sphere, of comets, the rainbow, the atmosphere, light, catoptrics, motion, together with arithmetic, geometry, music, the learned languages, medicine and ecclesiastical law, astronomy, metaphysics, and theology.” A tolerable list of attainments, requiring a pretty “large head” to stow them all away! And we are to remember that at the period there was not a single book, in our acceptance of the word, throughout Europe—nothing but manuscripts; “and a good manuscript was worth a good horse.” More than two hundred years were to pass ere Koster of Haarlem should cut his wooden types, and give the earliest idea of printing. How lessened would be the number of our own literati if their only means of learning was through the difficult and varying caligraphy and contractions of manuscripts! I suppose the only person in our day qualified to estimate the hardship of

such study is an editor; and I have looked with reverence and with pity at his piles of papers, wondering how one poor pair of eyes could get through them all.

The embryo bishop acquired manuscripts in Paris, and also learned to speak and write the language of the country to perfection. A *patois* of French was the current tongue

Grotesteste's humble prebendal stall for four successive archdeaconries; and so the former beggar-boy climbed onward to his bishopric.

For many years of this period, Robert Grotesteste had been more remarkable for science than spirituality. Severely merited he was always, even when a high-spirited

BISHOP ROBERT'S CONTEMPT FOR THE POPE'S BULL.

of the higher classes in England at that time; our marvellous composite English was spoken only by the churl and the serf, in terms unrecognisable by ears polite of the present. As yet the very earliest premonition of a national literature was not; Latin was the medium of monkish annalists, and Norman-French that of social intercourse.

While very young, Robert Grotesteste lectured in his university on the grave subjects of philosophy and divinity; and at the age of twenty-three had acquired a reputation for learning and steadiness, which caused William de Vere, Bishop of Hereford, to send him an invitation to become one of his household or ecclesiastical establishment. On this occasion Giraldus Cambrensis, whose name is known to most of our readers as an historian of eminence, wrote a letter of the highest encomium to the Bishop concerning the youthful Robert. But this patron died very soon, and Grotesteste continued lecturing in his college until he came under the notice of Hugh de Welles, Bishop of Lincoln, an eminently pious man, which was not always an episcopal qualification in those turbulent times; and finding in his diocese this ripe scholar (for Oxford was then a part of the Lincoln diocese), he was glad to advance him as he could. In the course of twelve years he had exchanged

youth among crowds of foolish young men; and, as an ecclesiastic, he was irreproachable where reproach was common. But it would appear to have been a dangerous illness, in 1232, which caused him fully to dedicate himself to the service of God. His sincerity was evinced by the immediate giving up of all his church preferments, and his return to the prebend's stall. We are told that his sister, a nun, wrote to him to inquire for his health; and in his reply he informs her of this resignation of his dignities, and hopes she will not fret about it, as his object was the better fulfilment of his duties.

Heretofore he had amused himself with experiments in natural science, which had gotten him the name of a magician, and with calculations in astronomy, which had caused him to be dubbed astrologer. The poet Gower, writing of "the great clerk Grotesteste," tells a story of a brazen head which he forged, and which could speak, and "give counsel in doubtful cases." One day, as it was being set up, it fell and was broken in pieces—the work of seven years destroyed in a moment, quoth the legend—and the fragments lie dormant in some vault of that very noble pile, Lincoln Cathedral, of course amid supernatural company. Another story, detailed by Richard of Bardney, a monk who composed a rhythmical life of

Groteste in Latin, is to the effect that once when the Bishop of Salisbury had promised to officiate at Rome on a certain day, and was unable to go, he sent for his archdeacon Robert the very day before, and stated his difficulty. Groteste bade him be comforted, for he himself would get to Rome that night and officiate in his stead. Away goes the archdeacon; summons to his aid a spirit-horse, by whose wings he forthwith mounts among the stars; finds—strange to say!—the sun revolving round the earth, and all things planetary in the erratic order assigned them by Ptolemy, and descends into the midst of Rome just in time to do the duty assigned to the missing bishop! A modern biographer guesses that the nucleus of truth here consists in the unusual energy of Groteste's character having conquered the difficulties of transit, and brought him to and from Rome in some space of time so short as to be incredible to that credulous age without the aid of necromancy.

That was the minstrel period, when bard and troubadour were largely honoured throughout Europe. During Groteste's lifetime, Richard the Lion-heart had been discovered in his Austrian dungeon by his musician Blondel, the lay sung and harped without the fortress being taken up by the captive prince within; and in the early ecclesiastical years of our Robert, the harp formed a chief delight of his leisure. He composed long religious "romances," or lyrical narratives, to be set to the harp; and De Brunne, a Gilbertine monk, who wrote concerning him in the reign of Edward III, says:—

"He lovèd much to hear the harp,
For man's wit it maketh sharp:
Next his chamber, beside his study,
His harper's chamber was fast thereby.
Many times, by night and days,
He had solace of notes and lays."

The poet goes on to state that one asked Groteste "the reason why he had delight in minstrelsy?" To which the bishop gave answer, that the harp and its music reminded him to worship God to the best of his power, as did David—

"In cords, in organs, and bells ringing,
In all these worship the Heaven's King."

Groteste was himself a poet of no mean note in his times. Seventeen hundred verses is the length of his "Roman des Romans," or Romance of Romances; also entitled "The Castle of Love," signifying thereby the love of God to men. It is an allegory of the fall and the redemption of the human race; written, as those testify who have read it, in the vivid manner of a mind which lived continually in the conscious presence of things unseen and eternal. The key to the theme of the poem is found in the lines—

"We oughten over alle thing
Worship Him with truë love."

These words are not Groteste's original, which was composed in Anglo-French; but from an ancient translation into what philologists call "early English." Another poem of the bishop's is his "Manuel Peche," wherein he treats of the Commandments, and especially those seven offences which the church of Rome is pleased to style "deadly sins." The before-mentioned Robert de Brunne published a translation of this popular composition about 1320, more than a century after the poem was written; his manuscript is still preserved in the Bodleian library. He states that his object was that it might be sung to the harp in public entertainments; some of his introductory words are as follows:—

"For lewede (unlearned) men I undertoke
In Englysh tunge to make thys boke.
For many be of such mannere
That tales and rymes wyl blythely hear."

There is a passage in Groteste's "Castle of Love," at the opening, which deserves transcription, and was eminently characteristic of the subsequent life of the man.

"The good one thinketh, good may do,
And God wyl helpe him thereto:
For was never good work wroughte,
Without beginning of good thoughte,
Ne never was wroughte none evil thinge,
But evil thought was the beginning."

We have much modernised the spelling of the specimen.

An era in Groteste's spiritual life was the appearance of the new orders of mendicant monks. They came as reformers, these Dominicans and Franciscans, with their vows of deep poverty, of perpetual preaching, among the slothful and sensuous Benedictines who lived on the fat of English land. Groteste had long regretted the intense worldliness of the clergy, seculars and regulars, and hailed the Franciscan zeal with gladness. He lectured for ten years in their chapel at Oxford, though he never took the habit of a friar; and his sermons were expositions of Scripture, with wondrous gleams of truth in them, considering the dark times and the dark audience. At this period he wrote a controversial work addressed to the Jews concerning their leading error, the perpetuity of their law: "a masterly argument, an admirable production," says a late biographer. He deserves a certain honour for having written "in a spirit of gentle candour" to a people detested and despised as the Jews were then; it was not so long since the regal dastard John had tortured and butchered numbers of the helpless Israelites. Everywhere spoken against, by every man considered fair prey on which to wreak his rapacity and cruelty, it is to the credit of Groteste that he was sufficiently in advance of his age to use only the modern weapon of the pen against them, and that with a gentleness and consideration which might be a pattern to controversialists among ourselves.

Of the friends and fellow-labourers surrounding Groteste in the university at this time, but few names have survived oblivion. We hear honourably of one Stow, his fellow-countryman, from Suffolk, as "a clear interpreter of Scripture;" of Adam de Morisco, on whom was bestowed the title of Illustrious Doctor for his learning and piety; above all, of Friar Roger Bacon, who calls Bishop Robert his "great master," and in 1234 was joined with him in a commission from Henry III for the better regulation of the University of Oxford.

Bishop Hugh de Welles died in 1235, and Groteste was his successor. He was sixty years of age; but nearly twenty years of good work for the church (not understanding by that term the Romish apostacy) was before him. A humble-minded man—there is extant from him a letter of touching modesty, penned when he was Archdeacon of Leicester, in which he states that he felt his acquirements trifling, when compared with the vast abyss of unsounded truth. "In innumerable matters which are objects of knowledge, I perceive myself enveloped in the darkness of ignorance;" and it was no mean proof of his advanced knowledge, that he could see the vast extent of undiscovered country beyond. Now was this humble man signing himself "Robert, by divine permission, the poor minister of the church of Lincoln." He owed his preferment to personal merit, and the free election of his brother priests. Six furnished palaces were for the residence of the former pauper boy; and never did a man "risen from the ranks" conduct himself in a more unassuming manner.

We have a picture of his entertaining the king at one time, the weak and unprincipled Henry III, during one of his royal progresses, and the monarch observed that

he was surprised to find a person of the bishop's mean extraction and severe habits of study able to acquit himself so elegantly as host. Whereunto Grosteste replied by acknowledging his obscure descent, but stated that he had, from the time of his beginning to read the Scriptures, always endeavoured to imitate the models of behaviour that he found therein. The king and his subject were not always on such friendly terms of conversation. Henry was determined to evade Magna Charta as much as he could, and constantly supported the pope in his illegal oppressions of the English church. Bishop Robert would not yield one jot of the national freedom to either prince or pope. Hence came many sharp contests.

His rule about the promotions in his diocese cut right at the king's and the pope's habits of presentation to non-resident persons, whose qualifications to fulfil the offices they undertook was the very last consideration in the minds of those who gave the benefices. But Grosteste wrote thus: "I dare not, for the love of God, confer the care of souls upon any person who will not sedulously discharge the office in person. For the office is of the greatest importance, requiring one who applies himself to it with vigilance, prudence, diligence, and fervour; who preaches the word of the Lord in season and out of season; who exhibits himself as an example of good works; who, when he gives salutary admonition, and is not regarded, can grieve and lament; whom no prejudice, passion, entreaty, gift, nor partiality can divert from the path of rectitude; who delights in labour, and whose sole desire is to profit souls." Under which description, from the pen of a medieval bishop, might be written, "Portrait of a true Christian Pastor."

Acting upon such principles, he utterly refused to consecrate a young man who came to him clothed in scarlet, and wearing a ring, as candidate for a large cure, though backed by a powerful courtier. This was almost the first act of his episcopate, as almost the last was his firm stand against a similar aggression of Pope Innocent's. The bishop had received a Bull of Provision commanding him to appoint one Frederick Savonia, an Italian youth, to the first canonry that fell vacant. Should the bishop presume to institute any one else, it would be null and void. Should he refuse to obey, or should he obstruct the appointment of Savonia, he must look for excommunication; and the bull ends with the celebrated clause of *non obstante*, or notwithstanding, setting aside all laws that could contravene.

Grosteste wrote a letter in reply, which has survived, and identifies his memory with the boldest of reformers. "It almost retorts excommunication for excommunication." "Your provisions are to destruction," he tells the pope. "Flesh and blood, and not the heavenly Father, hath revealed such doctrines. Your *non obstante* clause overflows with uncertainty, fraud, and deceit, and strikes at the root of all confidence between man and man. . . . No sin can be more adverse to the doctrine of the apostles, more abominable to Jesus Christ, than to defraud and rob these souls which ought to be the objects of pastoral care, of that instruction which, by the Scriptures, they have a right to. Such mandates ought not to be obeyed, though an angel from heaven should command it."

Never had the Holy Father heard such language in all his sacerdotal existence. No wonder that he burst into a storm of rage. "Who is this old dotard, deaf and absurd, who thus rashly presumes to judge of my actions? If I were not restrained by the goodness of my own heart," added Innocent, with an appropriate papal oath, "I would make such an example of him as would

astonish the world. Is not his king my vassal, my slave?" And the bishop was excommunicated; it was the year of his death, 1253.

But in the interval before this period he had worked well in his vast diocese. The city of Lincoln alone contained fifty-two churches; whence may be judged the magnitude of the concerns which Grosteste had to manage. He found reformation imperatively needed. Crowds of useless clergy and indolent monks met him on every side, who had taken orders to escape into a luxurious life from among the hard-working commonalty. He was continually making progresses throughout his province, and preaching himself in every place to which he went. Almost immediately on his accession he removed seven abbots and four priors for various offences. The clergy grumbled, waxed wroth, stirred up against him whatever powers they could. But he persevered. Once, having given notice of his intention to visit his cathedral, the prebendal churches and others, his dean headed the malcontents, and issued a mandate that the bishop should not be obeyed when he appeared. With his usual meekness of temper, Grosteste wrote a reply, averring his purity of intention, and praying his clergy, in all friendship, to show him any mistakes he had made or might make: he was willing to rectify any such, and make what reparation lay in his power. The dean and canons would not even answer his letter. When he arrived on the appointed day, no bells were ringing, no respect was shown to the diocesan. The dean and chief clergy had set out for Rome, the other clergy were not to be found. They had appealed to the Archbishop of Canterbury, who would do nothing; and then they forged a foundation charter of the church of Lincoln, which named the king as arbiter of all disputes between the clergy and their bishop. The decision was referred to the pope, finally, and a bull was given partly in Grosteste's favour. His canons again fling his mean extraction in his face, and declare their bitter repentance for having elected him bishop, and procure a secret assassin to give him poison, whence he recovered with difficulty, by the help of the Dominican Friar John de St. Giles, who had once been physician to the French king.

It came to his ears that Pope Gregory ix had promised to his Romans all the vacant benefices in England. After the news came a confirmatory bull, desiring the Bishop of Lincoln not to dispose of any preferment until 300 young Italians had been served. Grosteste cast the parchment from his hand with indignation. "If I should commit the care of souls to them, I should be the friend of Satan." Thereupon the pope deposed him, and sent a foreign prelate to take his diocese; but the people rose in arms, and protected their bishop.

The Legate Otho was called "fleece of the land, gulf of Roman avarice." Grosteste had frequent skirmishes with him, as may be imagined. When Otho revenged an affray of the Oxford students by an interdict and confiscation, the re-establishment of the University fell into Grosteste's hands. He wrote to the divinity teachers, requiring that they laid well the foundation of true theology. "The fundamental stones are the books of Moses and the prophets, the apostles and the evangelists; which you rightly lay, when you explain those books to your auditors by the gift of discerning spirits, according to the sense of the text." He adjures them in Christ Jesus to let their lectures be upon the New and Old Testaments only, and not on other matters compiled by worthy writers, and supposed to conduce to this end." He would have Scripture the sole textbook of theology: surely a Protestant principle.

A stormy episcopate had Grosteste. Twice excommunicated by popes, often obliged to contend with his monarch, and with his own priests, we find him once under the last ban of Canterbury, pronounced solemnly with bell, book, and candle. He had refused to put his seal to a circular letter for forcibly raising money to pay off the Archbishop's debts.

Three times he was cited to Lyons, then the papal residence. When seventy-seven years of age and very infirm, he appeared for the last time. We are told of his uttering, in the very presence of Innocent, the bold words—"O money! how great is thy power, especially at the court of Rome!" He composed a long sermon on the vices of the papacy, and gave copies of it to the pope and cardinals. We can only wonder that he ever came back to England.

He was dying on the sixth of October in that year. During the long wakeful night of restlessness which almost always precedes dissolution, he conversed with his chaplains on spiritual matters. Speaking of the state of the church, he said that nought but the edge of the sword could deliver it from the Egyptian bondage under which it laboured; he declared the pope a heretic, who for earthly and fleshly gain abused his trust of the care of souls. Some of the dying man's words seem distinct prophecies of the Reformation. And so, as Matthew Paris writes, "the holy bishop Robert departed this world, which he never loved."

Perhaps one of the best eulogiums on him was the triumph and delight of his papal foe Innocent. "I rejoice," he exclaimed, "I rejoice; my great enemy is removed." But all righteous men and faithful "clerks" throughout England went mourning for Robert Grosteste.

E. H. W.

LIFE IN JAPAN.

II. FOOD.

JAPANESE dinners are not very tempting to European tastes, consisting so much of what we are apt to term "messes." Beef, mutton, and pork, the substantial viands to which we are accustomed, are not eaten by the Japanese. The ocean, which surrounds and intersects their islands in every direction, is their store-house, and fish is their principal article of food. When presents are sent from one friend to another, a small piece of dried or salted fish, and some seaweed, accompanies them, tied with a red and white string, and wrapped in a paper, on which is written a sentence that, translated, means, "Happy those who never depart from the wisdom of their ancestors." This is done to keep them in remembrance of their origin from a race of fishermen, and their dependence on the ocean for their daily food.

The dinner-service consists of lacquered or china bowls and plates, on which the dainties are placed. The dining-table is not more than nine inches high, and the guests sit round it on their heels, using chop-sticks to convey the food to their mouths. Dried fish, prawns on a kind of sweetmeat resembling toffee, rock-leeches, pickled eggs, salted ginger, boiled rice, yams, pears, a kind of wild raspberry and radish, with capsi-cums, are amongst the principal dishes at a Japanese repast. Bread is represented by a sweet sponge-cake, and saki or rice wine, in great variety, is the invariable accompaniment. Tea is also largely drunk. A very delicate kind, used only on special occasions, is made from an infusion of dried peach-blossoms.

The coarse brown flesh of the whale is eaten by this nation of fishermen and women. Sharks' fins are par-

ticularly sought after. Bêche de mer, cray fish, dried shrimps, salmon fresh and dried, in fact, almost every kind of inhabitant of the waters, pay tribute to the dwellers on land. Even seaweed is compelled to furnish a nutritious food. Rice is the staple grain; the flour of millet makes nice little cakes; the lotus-seed (a kind of nut) is much appreciated. The Japanese raise a great variety of vegetables, but they are coarse, and without flavour. Beans, peas, lettuce, cabbage, etc., grow well on their fertile soil. Potatoes, also, are successfully cultivated on the hill sides. Large quantities are exported to the neighbouring Chinese coast, where they form a grateful addition to the tables of our countrymen and women in the Far East. Some other vegetables have also been introduced into Japan since it was opened to western intercourse. The cauliflower in particular has been most successfully acclimatised. Some seeds were obtained from England, and planted in the European gardens on the Bluff, near Yokohama, and the result was somewhat startling; for the stems attained the height of five or six feet, and one head was sufficient to supply a large dinner party.

The native vegetables are wanting in flavour, and the people seem to have no delicacy of palate. Many fruits flourish, but the fruit is not permitted to ripen, being gathered before it has attained maturity; thus all their peaches are rendered valueless to foreigners; pomegranates and persimmons are also wasted. Grapes are better appreciated; they are grown on some of the Damios' estates, and are said to belong to the ladies, who, if so, certainly bestow much care upon them. This fruit is occasionally sent great distances, carefully packed in boxes of arrowroot, which effectually secure it from the light and air, and when taken out it is perfectly fresh, with even the delicate bloom untouched, though it may have been transported some thousand miles.

The tender shoots of the bamboo are boiled as an esculent; it has a woody, but not disagreeable flavour; preserved as a sweetmeat it is very nice.

COOKING.

Stewing and boiling are the native methods of dressing food. In countries where coal is not in general use, strict economy in the matter of fuel must be practised, and therefore we see in Japan no vast kitchen ranges consuming large quantities of the black diamond, but instead, various stoves, in which a small amount of charcoal is burnt, just sufficient to produce the necessary degree of heat to cook the food. The kitchens attached to the temples and monasteries are spacious; and stewing, boiling, and soup-making are carried on, on a comparatively large scale, over charcoal fires embedded in brick-work.

In private houses, such as those which belong to the well-to-do shopkeepers and merchants, the cooking is accomplished without much display. A wooden fire-box, about the size of a cubic foot, lined with a substance which answers the purpose of a fire-brick, contains sufficient fuel to prepare a dinner; for, with proper attention from the cook, several pots containing rice, small pieces of fish, and vegetables can be kept at the due simmering degree of temperature.

Baking is done on a small scale, to prepare cakes and biscuits of different kinds from wheaten and rice flour.

Like their neighbours the Chinese, the Japanese convey food to their mouths by the aid of chop-sticks, or thin pieces of wood, bone, or ivory, about nine or ten inches long. It requires considerable dexterity to manage these implements properly. The two sticks are held in a peculiar way between the fingers of the right

hand, and if the rice be the edible undergoing consumption, the small basin containing it is held close to the mouth, and the contents are, as it were, shovelled in in a very ungraceful manner, according to our ideas. Then, if it is desired to partake of any fish, or meat, or vegetables, small pieces are taken out of their respective dishes by the help of the same chop-sticks which had been previously used in the rice, carving-knives being entirely dispensed with, as the food is cut up small before being cooked.

The Japanese china ware used for dishes, plates, cups, and basins is very beautiful. The material itself is excellent, and the colouring with which it is decorated is generally in very good taste and well harmonised. The egg-shell porcelain, which is as thin as the fragile article from which it derives its name, can be used, but it is, of course, too delicate for ordinary purposes. China cups, round which bamboo is beautifully interwoven, like basket-work, or strengthened with lacquer-ware, ornamented with mother-of-pearl, are also seen, but the common china is white, with a blue pattern running over it.

DRINKS.

The stimulating drinks of the Japanese are prepared from rice, and are generally known to foreigners under the name of sakee. They vary much in strength and flavour, probably to as great an extent as our own wines. Sakee is usually drunk warm. Some kinds resemble pale sherry in colour, and are by no means disagreeable; others are very strong, and their effect is soon seen on the people, numbers of whom are, unhappily, addicted to drinking—even the women indulging in this vicious habit. So general is this practice of drinking to excess, that towards evening the streets of a Japanese town become dangerous for quiet people, many two-sworded men, or Yaonins, frequenting them, who, when under the influence of sakee, become peculiarly quarrelsome, more especially towards foreigners; and murders have several times been committed in consequence.

We have already mentioned a delicate drink made from an infusion of peach blossoms, which is offered to favoured guests. The leaves of the tea shrub afford the most common, as well as the most refreshing drink. It is taken without either milk or sugar. Milk is not in any form an article of diet, cattle being kept for agricultural purposes only, such as ploughing, irrigation, etc. Some very choice delicate kinds of tea grow in Japan, the sandy hill sides being well adapted for the successful cultivation of this useful species of camellia. It is a pretty plant, having dark-green shiny leaves with serrated edges, and white blossoms, somewhat like our small dog-rose. The fresh leaf, when eaten, leaves a delicious flavour on the palate, and the odour which pervades the building where tea is being fired or dried resembles the delicate perfume of a hay-field on a dewy summer evening.

Our sisters in Japan are largely engaged in the manufacture of tea. The female hand is well suited to the delicate process of gathering the choice tender leaves of the early crops; and it is women who manipulate the tea in iron pans over charcoal fires, when preparing it for the foreign market. The tea used in Japan is merely picked and sun-dried, and does not require any further preparation. The firing and preparing tea for shipment give employment to large numbers of very poor women, whose appearance becomes exceedingly unattractive after they have been occupied for some time in the warm and dusty rooms, their complexions assuming a greenish hue from the light particles of the tea floating in the air and settling on them.

PETS.

All over the world dogs take the first position, when one wishes to speak of creatures of the animal kingdom selected as objects of care and interest by men and women.

The Japanese ladies possess a very choice breed of pet dog, supposed to be the same as that known in Europe as the Charles the Second spaniel. As some intercourse was still kept up with Japan by England, through the East India Company, during the reign of the Merry Monarch, it is probable that these pets of his court were introduced to this country from the land of the Tycoon. These dogs are small, with beautiful silky hair, fringed paws, and pug nose. So completely is this feature diverted from the purpose it ordinarily serves in dogs as a breathing passage, that it is difficult to believe the effect has not been artificially produced. It was not until we saw some very young puppies quite as deficient in useful noses as their parents, that we could believe the pretty little doggies were not cruelly used in their infancy, by their noses being in some way compressed. They are very delicate little creatures, and the utmost care is bestowed upon them by their mistresses, which they repay by manifesting much satisfaction when in female society, and selecting the long dresses to sleep on. Owing to the peculiar formation of the nose, they snuffle and snort during sleep, and the tongue hangs out from the left side of the mouth. We recollect once going to a dog-fancier's at Nagasaki, where numbers of these little animals were collected for the purposes of sale. They lived in elegant kennels, and at certain times were let out into a small dry courtyard for their morning airing, where they frisked, and barked and snuffled together to their hearts' content, and then these dear little things, dear in more senses than one—for the price ranged from twenty-five to fifty dollars, or from £6 to £12 each—were fed on boiled rice and fish, and replaced in their domiciles.

Japanese cats are different from our English tabbies, inasmuch as their tails are merely stumps. In that respect they resemble the Manx cats. Pussy, without her long curved appendage, loses much of her grace of form and movement, and it is some time before the eye becomes accustomed to the deficiency. Cats are there, as here, the household pets, and are encouraged for the same services which they render to us, viz., that of preying on rats and mice. If Dr. Rolleston's theory be correct, that the white-breasted marten used to be the mouser of the Romans, perhaps pussy has come to us from Japan; only it is curious she should have developed a tail in every other country but the Isle of Man.

A small pond, containing gold, silver, and purple-spotted fish is often introduced into the gardens. These fish are, of course, privileged pets, and swim about in happy ignorance of the fish-devouring propensities of their mistresses. The fins and tails differ much from those of the species we are accustomed to; they are particularly large and diaphanous, and the fish appear to move through the water by the aid of delicate white lace sweeps. The head is square and large, and the prominent eyes give it a singular appearance. A particularly choice kind has a round white body, with a golden head, and tail divided into three.

Japan is the land of pheasants, and the denizens of its woods have been caught and caged, to charm, with their brilliant plumage, those who care for and tend them. That gem of birds, the golden pheasant, with its bright crest, elegantly-marked ruff and rich orange-red breast, graces the aviaries, as well as the quieter silver pheasant, whose delicately-pencilled plumage has

a quiet charm of its own. The purple-breasted and copper varieties are also found in them.

Sportsmen and battues are unknown in Japan, so that the happy pheasants do not number man amongst their natural and most dreaded enemies.

The wild fowl around Yeddo—geese, ducks, teal, etc.—are never disturbed by the sound of fire-arms, it being contrary to the decrees of the government to fire a gun within a certain distance, (10 re.) of the Imperial city; so that they are perfectly tame, and the foreigner has some difficulty in believing that they are not domesticated birds. The bantams are particularly pretty—just such delicate-plumed little creatures that lovers of birds would choose for their pets. The tail of the cock bird is very curved and long, and quite sweeps the ground as he proudly struts about. The eggs are small, delicate in flavour, with very thin shells.

ON BOARD THE GALATEA.

IN our December part we gave some account of the good ship *Galatea*, and of her gallant and royal commander, the Duke of Edinburgh. The progress of the voyage is well known to the public from the official announcements in the press, but our readers may be glad of some further notes from the private letters to which we were indebted for our former communication.

The *Galatea* steamed out of Simons' Bay, Cape of Good Hope, on Wednesday morning, October 2nd, without any ceremonies, but merely a signal from the fleet, wishing her a pleasant voyage. She proceeded on her course with favouring weather, and making way at the rate of from ten to thirteen knots an hour. All went, according to the wish, as merrily as marriage bells, till Saturday the 12th, "when," as our correspondent writes, "after blowing fresh all the forenoon, we got into the fury of a cyclone, and had 'a regular sneezer' during the night. At 12:30 the lower deck was cleared, and all the men in the ship were up and at work on the upper deck to reduce sail, which it took three hours to do, the ship rolling so heavily that they could not stand, and were being continually washed into the lee scuppers. One of the young-officers* set a brave example to the crew, by running out himself upon the fore-yard, and showing the most timid (and, though British sailors, there were some such) what was to be done. Thus the duty was performed and the sail reefed."

Our informant, writing not for public, but private information, goes on with his description, in a manner which we trust will be found of sufficient general interest. "You know," he says, "what a cyclone is. It is a circular wind, and rather a disagreeable thing to encounter, as it sometimes shifts so rapidly as to leave but short time for meeting its tempestuous changes. To give you some idea of its force last night, you must conceive one of the coppers with which ships' bottoms are sheathed, and there were three or four of them lying on the upper deck, which were lifted up and thrown overboard as if they were so many sheets of paper. We were obliged to run before the gale, and for some time in a direct line for the Cape again. It was at times quite terrific. The ocean was one mass of white foam, and the seas immense, rising up and rushing along like so many living monsters, as if threatening every moment to devour the ship. Are you aware that

the waves in these parts are supposed to be the largest in the world? and I believe the supposition is nearly correct. I never saw such, and the *Galatea*,* being so long, works a good deal, and was set leaking like an old basket. I do not mean any serious leak, but annoying little drops dripping from every square foot of the berths, sides, top and bottom, and making dry clothing impossible—every deck wet, and the water washing about everywhere. The gale lasted, on and off, nearly a week, and through it all the gallant ship rolled on. By the 19th the angry winds had moderated, and the weather was again auspicious, with a fine breeze. She had sailed over 300 miles a day, and made 3050 in fourteen days."

On the Sunday our friend treats of an altogether different scene; but if its simplicity touches our readers as it touched our feelings, they will not be displeased if we present, in his own words, his account of a funeral at sea.

"The only new thing in the monotony of a sea voyage is the very old thing, death; and *that* came on board of us last night in the middle watch, and seized its victim, a poor marine, and so departed for the time, satisfied, but who knows how long? We buried him this afternoon at half-past three. If our burial service on land is considered beautiful and impressive, how much more so is the same ceremony performed at sea! Surrounded and alone, as it were, with only the greatest of His works, the mind has nothing to distract it from the contemplation of the solemn and last duty we pay to a fellow creature, taken from the midst of familiar comrades. Dong! dong! dong! Hark, there sounds the bell, and all officers and men, assemble on the deck. All is prepared and ready, the chaplain, in his surplice, waiting for the body, as the first glimpse of the white, red, and blue of the Union-jack appears, as it is carried up from below. We all uncover save the marines, and they present and then reverse arms, forming a lane for the bearers and their burden. After the rattle of the arms has died away, the silence, only broken by the tolling of the bell, the creaking timbers and the sighing wind, is absolute. Even 'look-out' in the fore-top, a hundred feet away, is, I see, standing reverently and bareheaded, to witness the last of one who till late last night was a shipmate. Up into the daylight comes the Union-jack, and as it reaches the upper deck the wind raises the bunting gently, but enough for me to see the grating, and a red stain of a deeper colour than the flag, oozing through the hammock† (his coffin), and marking the wood. And now it is resting on the gangway, partly overhanging the heaving water. I hear the murmur of the chaplain's voice (for I am too far away to hear the words), then a splash sudden and solemn, and the gangway is empty. We have committed the body of our brother to the deep, and before the service is over, and the three volleys of musketry have died away, he is far astern and many fathoms down:

"The bright blue sky above his head,
The waters all around him."

And so ends the last of this strange eventful history. Yet what of that? we are one the less; the band will play, the crew make sail, and the lost mariner will be by most forgotten. Yet he may be missed in some expectant quiet nook of old England as a good husband, a loving father, and a dutiful son, when the sad news

* We may be pardoned for extracting the name of this gallant midshipman—the Hon. Mr. Curzon—whose "pluck" was rewarded by the prince calling him aft when the service was over, and commending him warmly for the intrepid conduct he had displayed.

* Our correspondent, like all true sailors, speaks of his ship as if he loved her. There is nothing to compare with her on the ocean, except, perhaps, her companion, the *Ariadne*, and on the present occasion she "rather astonished some of them" by the manner in which she strained and worked.

† The cause of death to account for this is not stated.

reaches his early home." On the 22nd another man, who died suddenly, was in the same manner committed to his ocean grave.

Our letters of later date tell of the loyal reception and stirring events of the Australian visit; but most of this has been transferred to the English from the colonial newspapers. One thing we may notice, that the duke's "service dinners," of about a dozen guests at a sitting, astonished the colonists who heard of them, and elicited admiration at the cook's art, with materials so limited by the length of the voyage, and the absence of shore supplies. All that foresight and skill could arrange were certainly supplied for the voyage of the Galatea.

A few words in conclusion, about the picture of the Galatea, which forms the frontispiece to our monthly part. It represents the ship, not in the recent cyclone, but in a yet more fearful storm, which she encountered when under another command. She proved herself on that occasion a truly sea-worthy craft. It was one of those tremendous West Indian hurricanes so fatal to many a strong vessel, manned by many a gallant crew. Captain Maguire,* since dead, was the commander. It was a perilous ordeal, out of which the good ship came so severely shaken that it was for some time a question whether she must be left in these seas a shattered wreck, or risk the home voyage.† It was an anxious time for the commander. If assailed on the homeward voyage, could she outlive another storm? Fortunately the substantial safety of the hull was ascertained, and temporary repairs proved sufficient for the return, and the Galatea survived to become more than ever noted in the annals of the Royal Navy.

FAR-OFF VISION.

FROM Apia, Navigators' Islands, Mr. Trood has sent the following summary of his theory and experience as to far-off vision, in reply to the criticisms that appeared on his former paper in the "Leisure Hour." It will be remembered by many of our readers that Mr. Trood, like M. Bonniveau, formerly in the Mauritius, claimed the faculty of seeing ships and other objects long before they were visible to ordinary vision.

* The Galatea becoming historical, any little anecdote connected with her may, at any rate, like the following, be amusing. His royal highness's predecessor, an excellent and highly esteemed officer, had in him a rich dash of the impetuous and genuine Irish character. Once, when earnestly reproving a delinquent sailor, he crowned the lecture with the bitter reproach, "Worse than all, you are a disgrace to the flag you are flying under!" On another occasion, signalling an invitation to a colonial governor and his lady to dine on board, he was adding that he would be happy to receive the family and their governess (a very pretty woman) also, when one of his officers near him hinted that the message might possibly be misconstrued. "Indeed, truly," exclaimed the captain to the signal-man; "*belay the governess!*"

† Mr. Sear, the skilful and experienced chief engineer, was anxious about the machinery, and wished to know the state of matters below the surface. There happened to be a diving-dress on board, but no divers. One of his staff, a young assistant engineer, had been permitted, in calm weather, to disport himself in this panoply, and, somehow, a look towards him was cast in the emergency. But diving was no part of an engineer's duty, and the task was dangerous—so dangerous that the captain would not run the responsible risk of ordering it out of the ordinary line of service. Nor did the youth think it right to volunteer it in a foolhardy manner, but had it intimated to his commander that if he requested, or expressed a wish for it, he would at once equip himself and do his best. The result of his exploration appears in the following record from his captain, and entered as a memorandum at the Admiralty:—"Great credit is due to Mr. Jerdan, assistant engineer, for services rendered in examining the ship's stern and screw well, by diving. He went down in the diving-dress seven or eight times." To this recommendation it is probably owing that the diver was reappointed to the vessel, with whose hull he was so well acquainted, has had the honour to accompany the royal duke, and received his farther promotion to engineer as rapidly as the rules of the service could allow.

The following is Mr. Trood's communication, which we give in full for the sake of those who take interest in the subject:—

I conceive that all clouds exhibit on their outline the outline of terrestrial objects.

Clouds above the horizon exhibit on their outline the outline form of objects above the spectator's horizon.

Clouds on, that is, touching the horizon, exhibit on their outline the outline form of objects beneath the spectator's horizon.

Such outline images appear at times to be reflected from cloud to cloud.

Clear weather, involving a condition of the atmosphere unfavourable to the formation of cloud, exhibits but few form-clouds of objects above the horizon; and the form-clouds of objects at a distance are consequently then less liable to be intercepted by such. Land and vessels at a distance are then indicated by their respective form-clouds, according to the condition of the atmosphere in their several localities. And, in clear weather, it sometimes happens that while objects at a distance of 300 to 350 miles are plainly pointed out by their form-clouds, objects much nearer, say 50 to 100 miles, give no sign of their existence; but usually I found that on a clear day every object within, say 300 miles, was for a few minutes, at some time or other during the day, indicated by its clouds, either in vraisemblance small black form-clouds, or jaunesemblance small yellow, etc., or blancseemblance small white, etc. (See "Leisure Hour," 1866, p. 486.)*

In a state of the atmosphere neither clear nor thick, only objects at a moderate distance, say 100 to 120 miles, can be made out; and, as the atmosphere is then favourable to the formation of cloud, their form-clouds will be larger and more extended, appearing in yellow or black masses (see "Leisure Hour," 1866), according to the hour of the day at which they appear.

In thick weather, the dense masses which fill the heaven wall in the horizon, and bear on their outline the outline forms of objects either above the spectator's horizon or else just beneath it.

Thus, in thick weather, the great number and size of the form-clouds of objects close to the spectator prevent him from perceiving the form-clouds of objects at a limited distance; while, in moderately clear weather, the form-cloud of objects at a moderate distance prevents him from perceiving the form-clouds of objects at a great distance. Also, in thick weather, the clouds just above objects above the horizon exhibit on their outlines, in a more marked manner than in clear weather, the outline forms of such.

Land at a distance is indicated to the spectator by round or pyramid clouds.

Vessels at a distance are indicated by clouds bearing on their outline the outline form of the said vessels, according to their position as regards the spectator; viz., whether broadside on or standing from or to him, etc. If a drawing of a ship or schooner in full sail be cut into relief, placed on a sheet of paper, and pencilled round, the rough outline form thus obtained will present a tolerably perfect resemblance to nine out of every ten vessel-clouds. If the vessel be only from forty to seventy miles off, there may be many such form-clouds on the

* May I point out some errors in the letters published in the "Leisure Hour," 1866 (pp. 485-6):—For "Bottineau" read "Bonniveau" (p. 485). For "at this port" (p. 486, line 22) read "on the south side of this island—Upolu." For "westward" (p. 486, line 54), read "eastward." For "about the same distance" (p. 486, 2nd col., line 53), read "various distances."

horizon at and over the spot where she is. Such form-clouds, though constantly changing, never wholly lose their resemblance to the object; and the two-masted or three-masted image (as the case may be) and bowsprit always emerge from each change of form, and declare distinctly the character of the object. Sometimes the form-clouds of both land and vessels at a distance form an angle with the horizon of 45° to 65° . I noticed, at night at sea, this peculiarity with a two-masted vessel, distant about fifty miles. We sighted her next morning. Her form-cloud extended one-fourth way to the zenith.

The best time for observations is a little before and after sunrise for objects to the eastward; and a little before and after sunset for objects to the westward. When the moon is near or at the full a good observation of objects to the eastward, at moderate distance, may be obtained just before her rising. And note particularly, all clouds that do not touch the horizon are valueless as indicators.

When success first attended my inquiry, I was sanguine that far-off vision might be turned to daily practical use by the navigator, but now doubt of this, unless an instrument can be invented to resolve the cloud distortions into the exact images of the objects. I yet hope that this discovery is destined to act an important part in future voyages of exploration.

In conclusion, it is well for me to remark that I have long since ceased to make regular observations. Unless, therefore, scientific men think the subject worth examining, and (either at the Mauritius, or some other place equally well suited, by its clearness of atmosphere, to the investigation) set on foot horizon-cloud observations, there is every reason for fearing that far-off vision will meet the same fate under my auspices that it did under those of my predecessor, Bonniveau, a hundred years ago; and that its vast and sublime phenomena, which open to science a new and unexplored region of useful research, will continue to pass unheeded before unseeing eyes.

THOMAS TROOD.

P.S. With reference to some doubts raised by Mr. Dunkin, of the Royal Observatory, (see "Leisure Hour," 1866, p. 512), I would submit to that gentleman—First. Although *vraisemblances*, *jaunesemblances*, and *blancseemblances* of land may proceed from change of temperature in the circumambient atmosphere of the land they shadow forth, yet it is unlikely that *vraisemblances*, etc., etc., of vessels are produced in this manner. This argument is supported by the fact that the size of objects appears to be a secondary matter in observation, —small vessels evincing themselves with sometimes greater distinctness than do islands equally distant, that are twenty to thirty miles in circumference. Secondly. Vessels seen by far-off-vision are not reflected by the face of the clouds, as in a mirror, but their presence is declared by each whole cloud. [While on this part of the subject, I may remark, however, that the leading features of near land sometimes appear to be reflected by the face of large clouds.] If, on a clear day, horizon-clouds appear in a direction in which there is no land within four hundred miles, they denote a vessel, and their outlines, not their face, will determine whether she has two or three masts, etc. Lastly. Many sailors can see what is called the loom of land and ships long before the latter appear to landmen; and in small ports, visited by few strange vessels, the residents, especially if nautical men, can generally tell, by the cut of particular sails, and other peculiarities of rig, the names of vessels that frequent the port, almost as soon as they heave in sight.

T. T.

Having submitted the foregoing paper in manuscript to Mr. Dunkin, he appends the following reply:—

The explanation given by Mr. Trood of the phenomenon of "Far-off Vision," as observed by himself and M. Bonniveau, is certainly very ingenious, and I have no doubt he is perfectly sincere in his conviction that the apparent indications which he has perceived in the form of the outline of clouds have originated as he describes. But I must confess that my mind is not sufficiently clear on the subject to believe the possibility of such an occurrence taking place at the distances which he mentions, from 300 to 350 miles. In a former note ("Leisure Hour," No. 763) I pointed out clearly that the small horizon-clouds "may indicate distant land, and can be explained by some of the fundamental rules of meteorological science." Of this there is no doubt whatever; but with regard to vessels this explanation would not account for the phenomenon described by Mr. Trood, because the radiation of heat from any vessel would be far too insignificant to form sensible cloud. Mr. Trood says that "vessels seen by far-off vision are not reflected by the face of the clouds, as in a mirror, but their presence is declared by each whole cloud." By this I am led to infer that the vessel-like cloud-forms are not produced solely by reflection, but that the cloud itself has in some measure originated by an influence which the vessel may have over the immediate atmosphere above it. Now this idea appears to me very unlikely, if not impossible. Again, granting that the origin of these "*vraisemblance* small black form-clouds" do arise from the influence of the vessel on the local atmosphere, such a phenomenon could not possibly be seen at a distance of 300 or 350 miles. I have taken the trouble to calculate what would be the apparent magnitude of an object seen 350 miles off. Let us suppose that the cloud-formed vessel is a mile in absolute length: its height above the surface of the earth does not alter our result. The image reflected on the retina of the eye of the observer situated at 350 miles distance would equal only about ten seconds of arc. In a powerful telescope, magnifying 150 times, this quantity would probably be no greater than a pea, while to the naked eye, looking towards the horizon, it would be scarcely visible, or if so to very acute eyes, it would not be much larger than a pin's point. But I have assumed in my calculation that the earth is flat, which we know for certainty is not the case; consequently, it is a very doubtful question whether the clouds localised at a distance of 350 miles can be seen under any circumstances so far.

Notwithstanding, however, my disbelief in the accuracy of this reputed "far-off vision," I have no hesitation in saying that the vision of Mr. Trood, and also that of M. Bonniveau, has been most singularly acute, and that they have been able to perceive distant objects before persons with ordinary sight. In my opinion the fancied vessel-like forms in the outline of clouds, "coupled with some happy coincidences of arrival, have somewhat deceived them." With the last paragraph of Mr. Trood's postscript I decidedly agree, an illustration of which I gave in my former note. It is a very natural circumstance that when people have been accustomed to use the eye for years for any special purpose, they should be enabled to view minute objects of which others have no visible perception. For example, as it is with the sailor accustomed to be on the look-out for distant objects, so it is with the astronomer, who at noonday is able to observe objects in a telescope, which would be invisible to the most acute eye of strangers, even when looked for through the same telescope.

THE SEARCH FOR THE POCKET-BOOK.

THE MORTONS OF MORTON HALL.

CHAPTER XVII.—MR. ASTON DISCOVERS THAT HE HAS BEEN PLUNDERED OF A LARGE AMOUNT OF MONEY.

MR. ASTON'S recovery was slow and painful. During the early period of his illness he had lain in an utterly passive condition, seeming to recognise nothing that was passing around him, and apparently perfectly oblivious of the past, making neither sign nor motion, and silent save when he gave utterance to a low moan of pain.

Gradually, however, he recovered the use of his

faculties, and then his improvement became more rapid, until—about a month after Henry Talbot had sailed for America—he was able to sit up and receive the visits and congratulations of his friends.

Among his earliest visitors were Miss Wardour and Mary Talbot; and Mary seized the opportunity to explain the cause of her brother's apparently unfeeling conduct and abrupt departure from St. David.

"Doctor Pendriggen has already told me the circumstances, my dear young lady," replied Mr. Aston. "The poor boy had no alternative, and by all accounts he did me the greatest service he could render, by hastening

back to the village and sending a message to the doctor."

"My brother regretted very sorely the necessity of leaving you," returned Mary, rejoiced to find her excuses so well received; "and I am sure," she went on, "he would have gone away much better satisfied if he could have seen you during his second visit to the village."

"Henry could not have been more pleased to see me than I should have been to see him," continued Mr. Aston. "I wanted very much to explain certain matters to him before he sailed for America, and it was with that object in view that I asked him to walk with me the last time we met. I must make *you* my confidante, now—that is, as soon as I grow a little stronger, and *you* must explain by letter to your brother."

Miss Wardour and Mary came away, the latter glad that the explanation which she had dreaded had been taken in such good part, and the next day Mr. Sharpe called at the cottage on his way to the village. The curate found Doctor Pendriggen seated with his patient, and, after a few words of greeting and congratulation, the conversation turned upon the surprise and alarm with which the intelligence of Mr. Aston's sudden and serious attack of illness had been received.

"By the way," observed the invalid, "I must not forget to reward the good fellows who brought me home so carefully——"

"They look for no reward," replied the doctor. "I am a Cornishman myself, and I must say, on behalf of the Cornish fishermen, that they are always ready to perform a generous action, even at great risk to themselves, without a thought of recompense beyond the approval of their own consciences. As to the mere act of conveying a sick gentleman to his lodgings, it was but an act of common humanity that any strangers would have willingly performed. Besides, Tapley tells me the men refused to accept a guinea that young Talbot would have forced upon them."

"Did they? I am afraid that Henry, poor boy, had but few guineas for his own needs when he left us. However, whether he rewarded them or no, there is no reason why I should forget to reward the poor fellows, whose humanity probably saved my life. Mr. Sharpe (addressing himself to the curate), I shall trust to you to become my almoner on this occasion. Will you oblige me by presenting these men—Tapley will tell you their names—with a five pound Bank of England note, to be shared equally between them?"

Mr. Sharpe expressed his readiness to oblige, though both he and the doctor protested against what they regarded as too profuse liberality.

Mr. Aston, however, would not listen to them.

"I will give you the money while I think of it," he went on, and, addressing the nurse, who was waiting in the room, he directed her to bring him the pocket-book she would find in the breast-pocket of his great-coat.

"The coat is in the wardrobe, I suppose," he added, perceiving the woman to hesitate.

"I suspect," interposed Doctor Pendriggen, who remarked that the woman still hesitated, "that nurse must apply to me for the key of the wardrobe, Mr. Aston. In the confusion that occurred when you were brought home in a state of unconsciousness, Mr. Sinclair, who had come down from the Rectory, suggested that it would be advisable to lock up all your effects, since there were so many strangers about. So, as soon as the fishermen had undressed and put you to bed, with the assistance of your man Thomas, the rector and I put all your clothes into the wardrobe—we did not know what valuables your pockets might contain—locked

them up, and locked all your drawers likewise, except one, which we found to contain linen, and other necessary articles that you might require, and at Mr. Sinclair's request I took possession of the keys.

"Here they are," he went on, laughingly, and drawing a bunch of keys from his pocket and handing them to the invalid. "Henceforward I resign my trust."

"I'm sure I'm greatly obliged, both to you and Mr. Sinclair, for your thoughtfulness," replied Mr. Aston, and, selecting one of the keys from the bunch, he pointed it out to the nurse, saying—

"This unlocks the wardrobe. The pocket-book you will find in the breast-pocket of the thick great-coat."

The woman unlocked the wardrobe, and searched for some time unavailingly. At length she declared she could find nothing in any of the pockets.

"Stupid woman!" exclaimed the invalid, giving vent to his natural irascibility; "bring the coat here. Yes; that's it," as she held up a coat for her master to see.

"Theer bean't nowt i' th' pockets, sur," muttered the woman.

Mr. Aston searched the pockets himself equally in vain, and then, looking up with a blank air of amazement, he said—

"It is *not* here; and yet I am positive—*quite* positive—that it was in the breast-pocket of my coat when I was taken ill. I have a particular reason to know. I felt it, and was about to draw it forth not five minutes before I became unconscious."

"Are you sure it did not drop out?" inquired Doctor Pendriggen.

"Quite sure. It *could not* have dropped out. Don't you perceive that the pocket is inside the coat, and that it buttons securely? I felt it from the outside."

"Th' pocket weer buttoned toight oop when aw went to th' wardrobe just now," put in the nurse. "Aw'd a mort o' pains to get it undone."

"Then the pocket-book has been evidently abstracted by some person, and the pocket subsequently buttoned up," said Mr. Aston. "Where is my gold watch?" he inquired of the nurse.

"The watch and seals and a gold pencil-case are in the uppermost drawer of the bureau," said Doctor Pendriggen, answering for the woman; and, taking the bunch of keys from her, he went to the drawer and produced the articles in question.

"And now I think of it, Mr. Aston," he went on, "I do not believe that the pocket-book you speak of was in your coat-pocket when the garment was removed from your person. Both Mr. Sinclair and myself passed our hands over the several garments, and took everything of any bulk from the pockets—some of which we felt—that we might lock the things up in the drawers for greater security. That was how we came to find your watch and pencil-case, and I think, had the pocket-book been in the coat-pocket, we should have felt that, and removed it. However, if it had been in the coat-pocket *then*, it would have remained there, unless some person possessed a duplicate key of your wardrobe, which is not probable."

"Better search the pockets of all the garments in the wardrobe," suggested the curate.

"It will be useless," replied the invalid. "As it is not in the great-coat pocket, I am sure it is in no other one."

The search, however, was made, and made in vain.

"Gentlemen," said Mr. Aston, "the pocket-book must have been stolen from me by some one of the fishermen who brought me home."

"I hope it did not contain any large amount of money," said Mr. Sharpe.

"It contained," continued Mr. Aston, "four Bank of England notes for fifty pounds each, which I had directed my banker to transmit me from London only a day or two before I was seized with illness. Besides the four fifty pound notes there were three or four notes of lesser value—one ten, and two five pound notes, I believe, and three or four guineas. In addition to the money were several letters and papers of great consequence to me, and a trinket which I have retained in my possession from my boyhood, through good and evil fortune; and, much as I regret the loss of the money, I regret still more the loss of the trinket and the papers—though two hundred pounds and more is no trifling sum to be robbed of."

"Do you know the numbers of the notes?" inquired Doctor Pendriggen.

"I do not," replied the invalid. "Perhaps my banker may. The notes were quite new and crisp. As I have said, I had sent for them for a special purpose, which was frustrated by my unfortunate illness. The trinket I speak of was a locket of massive gold, which contained a portrait painted on ivory, of my only sister (deceased), taken when she was a child. The case was engraved with my family arms—the crest a shield, quartered with two daggers and two stars, and surmounted by a griffin—the motto in a scroll beneath: '*Aut viam inveniam, aut faciam.*' I should recognise the trinket at a moment's glance."

"It may have been sold to some pawnbroker or jeweller in one of the neighbouring towns," suggested the curate.

"A thief would not be so rash as to sell such an article to any person in the vicinity of the village," said the doctor; "though it has, very likely, been thrown into the melting-pot before this."

"At all events, I would not have parted with it for a hundred pounds—not for any amount of money, in fact, unless I had been reduced to sore distress," continued Mr. Aston. The papers, too, though useless to others, were of value in my eyes. However, there can be no question but that the pocket-book and its contents are gone—gone long enough to preclude all hope of their recovery. I may never know who has plundered me so shamefully."

"Are you quite sure, my dear sir, that there is no mistake?" inquired Doctor Pendriggen. "I can scarcely believe that any of our coast-fishermen would be guilty of such a theft, under any circumstances. Are you sure that you have not put it away in some secret hiding-place, and forgotten that you did so?"

"I will very soon satisfy you on that point," replied Mr. Aston, sharply, feeling somewhat angry at the doctor's incredulity.

He touched the bell-pull, which hung within his reach, and the old housekeeper Margery presently made her appearance.

"Margery," he said, "do you recollect the morning on which I was brought home ill from the beach?"

"Ees, sure, sur. Aw shauna' easy forget yon mornin'."

"For what did I send you up stairs just as I was going out?"

The housekeeper thought for a few moments, and then replied—

"Aw mind nowt, but thought 'ee sent me oop stääirs to bring 'ee down t' pocket-buke 'at lāaid on dressin-table, i' bed-room."

"You brought it to me as I stood at the door?"

"'Ees, sur, an' tha' bade me put un i' thy pocket, an' button t' pocket ower't."

"You are sure of that?"

"Sartin sure, sur. Aw canna forget, 'cause tha tell'd me to ha' dinner at fower for thysen and Master Talbot, an' said as Miss Talbot 'ud be oop to spend t' evening. Aw gotten dinner a' ready, an' 'tweer spiled 'cause o' thy illness."

"That will do, Margery."

"The woman's a better witness even than I thought she would prove," the invalid continued. "I feared I should have to refresh her memory. Now, doctor, are you satisfied that the pocket-book is lost?"

"My dear sir," replied the doctor, "I did not doubt that the pocket-book was lost, though I did think you yourself had probably lost or mislaid it. I cannot now doubt that it has been stolen."

"It is a very unpleasant affair," the doctor presently went on. "It attaches a stigma to the whole body of the fishermen. However, late as the discovery of the theft has been made, we must set to work at once to find out who was the thief, or whether there were more than one concerned in the matter."

"Too late, I'm afraid," said Mr. Aston.

"I think not. Good opinion as I have of the honesty of the fishermen generally, I don't see who else *can* have stolen the pocket-book. I think it more than probable, whoever stole the property, that it is still in his or their possession. I very much doubt whether there is one among the villagers who would know the value of a fifty-pound note; or, if its value were known, I believe the thief or thieves would be afraid, and even unable, to change a note of that amount. The smaller notes, and the gold, may have been spent; but I believe that if any of our people hold your fifty pound notes, they are very likely to keep them for months—perhaps years—until they fancy the affair is entirely forgotten; and thus, perhaps, a new fishing-boat may be purchased with the money. It is a disagreeable thing to say, but I suspect that the money was stolen in the belief that you would not recover from your sudden attack of illness. The thief, in that case, would wait quietly for your death before he tried to get rid of the notes, and, as he must soon have heard that you were in a fair way to recover, he would still hold on to them, fearful of detection, if it were to become known that he was possessed of so much money."

Mr. Sharpe was of the same opinion as the doctor.

"I don't think," he said, "that any of our people have been absent from the village during your illness, even for a day. If they have, Jemmy Tapley has known of their absence, and we shall learn the truth from him, so far as he knows it, at all events."

"I see no other plan than to cause the arrest of the party who brought you home from the beach—on suspicion—and to submit them to a close questioning and cross-questioning," continued the doctor.

Mr. Aston had sat silent, in deep thought, for some moments.

"No, doctor," he now said; "I will not consent to the arrest of these men. I would rather lose all that the pocket-book contained, twice over, than subject the innocent to suspicion. I have no doubt that one or more of the party stole the property, but I do not believe that *all* were concerned in the theft; and, if the innocent are arrested on suspicion, the suspicion will probably attach itself to them for life, though their innocence be made ever so clearly manifest. Still, I should certainly like to recover my property, or, at all events, the locket, and *one* of the papers I have spoken

of. Would you trust to old Tapley's secrecy, gentlemen?"

"If Jemmy Tapley were to promise to keep a secret, nothing could induce him to break his promise," replied Doctor Pendriggen.

"Then," continued Mr. Aston, "will you request the old man to attend at the cottage to-morrow? We will tell him what has occurred, and ask him to watch whether any of the fishermen, or their wives, appear to be spending more money than usual with them. If he discover that such is the case with any one or more among them, let him make known the discovery, and then we can consult as to our future action in the matter."

After some further conversation on the subject, it was arranged that the curate should see Jemmy Tapley, and request the old seaman to call at the cottage at a certain hour on the next day, and meanwhile that none others—with the exception of Mr. Sinclair—should be admitted to the knowledge that the theft had occurred and had been discovered.

The nurse had been sent out of the room after she had failed to find the pocket-book, and she and the housekeeper were subsequently informed that their master had recollected how he had lost the pocket-book in question. Neither of the women had any idea of the value of the contents of the book; therefore they did not appear to attach any great importance to the fact that it had been, as they were led to suppose, temporarily mislaid.

The doctor and the curate left the cottage together, both exceedingly annoyed at the idea that such an unpleasant affair had occurred in the village.

The doctor was especially annoyed at the thought that he had interfered in any way with the effects of his patient. Not that he supposed Mr. Aston would attach any blame to him. Still, as he observed to the curate, he would rather the watch and seals, and the garments the invalid had worn that day, had been lost, as well as the pocket-book, than that he, under the circumstances, had taken possession of the keys of the wardrobe and bureau.

Mr. Sinclair accompanied the curate and Doctor Pendriggen to the cottage on the following day, when, of course, the robbery was the chief topic of conversation; but to the astonishment of his friends, Mr. Aston, though evidently vexed at the serious loss he had sustained, appeared to think less of the matter than they. He believed, in fact, that too long a period had elapsed since the property was stolen to leave much hope of its recovery, and had made up his mind to submit quietly to his loss.

At the appointed hour Jemmy Tapley made his appearance, and was made acquainted with the circumstances attending the theft.

The old sailor, however, listened indignantly to the supposition that the fishermen had stolen the property. He could hardly be brought to believe that the pocket-book had been lost in the way that was asserted by Mr. Aston; and when so positively assured that such was the case that he could not deny it without charging his informant with falsehood, he said vehemently—

"If 't had been a package o' bacca, or a keg o' rum, or sich-like, or anything o' greater wally from a wrack, as had been fairly cast ashore by t' sea, aw shouldn't ha' been so tuk aback as aw be now; tho', as his reverence do say, that bean't ersackly honest. It bean't no easy matter to make folks b'lieve as what their feythers and gran'thers ha' done afore 'em arn't right and proper. But for to say as chaps as gets theer livin' on saut-wather

—tho' 'em bean't ersackly sailors out an' out—'ud go for to do sich a scurvy trick as to rob a sick genelman o' his money! Theer, now. Aw can't b'lieve it unless it be clear proved ag'in 'em."

The old man could hardly be persuaded to take any part in the endeavour to discover the thief or thieves. The very name of an informer or a spy was odious to him.

Doctor Pendriggen and Mr. Sinclair, however, were so anxious that the guilt should—for the sake of the rest of the inhabitants of the parish—be brought home to him or those who had brought discredit upon their fellows, that Jemmy Tapley finally consented—not, as he averred, to play the part of a spy, but to do his best to discover the real thief, that he might prove to them all, as he was certain he would be able to prove, that the fishermen were unjustly accused.

* * * * *

Time passed away. Mr. Aston was once more able to walk abroad, and was almost restored to his former condition of health and strength; yet nothing had been heard of the lost property, nor had anything transpired to direct suspicion towards any person in the village. The poor fishermen, who had been suspected in the first instance, had been narrowly watched, and were found to labour as steadily as ever at their arduous calling, while none among them appeared to be any richer than they were before.

Doctor Pendriggen, Mr. Sinclair, and Mr. Sharpe, who, besides Jemmy Tapley, were the only persons who had been admitted to the secret of the robbery, though they had no doubt that the pocket-book had been really lost or stolen, had come to the conclusion—despite Mr. Aston's assertions, corroborated as they had been by old Margery—that it had been lost previous to the day on which he had been so suddenly struck down with illness.

They knew that on the previous day he had visited Falmouth, whither, to gratify some whim that no one could understand, he always went on the arrival of the American mail, that he might receive his letters *himself* from the postmaster, instead of allowing them to be brought to the village by the letter-carrier; and it was their firm conviction that the pocket-book had been lost or stolen on that occasion.

During his late illness his mind had wandered, and his memory as well as his other faculties had been impaired, and they thought it very probable that he had been mistaken in his belief that he had placed the book in his pocket at the time when he fancied he had so done; while, as regarded old Margery, she had been so terrified at her master's sudden illness—had been so "dazed," as she expressed herself—that she might easily have been mistaken as well as he.

However, unless the subject was spoken of in his hearing, Mr. Aston never made any allusion to his loss; he never even once questioned Jemmy Tapley relative to the success or ill-success of the old seaman's researches, and in fact seemed to be annoyed or irritated when any of his friends recurred to the matter, as though it were his wish to banish it from his memory.

He occupied his time in visiting his friends, and during his long walks about and around the village, making more intimate acquaintanceship with the people. He appeared to take great interest in the schools, and in the various measures employed by the rector to improve the condition and increase the comfort and happiness of his humble parishioners, and he not only gave his advice and personal assistance to these various projects, but was also liberal with his purse

when money was required. Thus Mr. Sinclair, who had hitherto borne all the expense of his various projects and improvements out of his own purse, found, in the new tenant of Cliff Cottage, a useful and able coadjutor.

Mr. Aston likewise continued to take a kindly interest in the young governess, Mary Talbot, though, somewhat to Mary's astonishment, he now rarely spoke of her brother, to whom, on the occasion of the young man's first visit to St. David, he had shown such marked kindness. She attributed this reticence on his part to some lingering resentment at the abrupt manner in which Henry had left him to the care of a party of fishermen, when he was suddenly seized with illness, though he had expressed himself perfectly satisfied with her explanation of her brother's apparently unfeeling behaviour, and had said that the young man had done him the better service by hastening to the village and sending a messenger to Doctor Pendriggen. She often wondered, too, what it was that Mr. Aston's sudden illness had prevented him from communicating to Henry; for though he had promised to make communication through her, he had never again alluded to the subject.

Here, for the present, I leave the parish of St. David and its inhabitants, while I turn for awhile to widely different scenes, and to other persons connected with this history.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDE.

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."
COWPER.

III.—THE WHITE SLAVES OF MODERN ARCADIA.

IT was very pleasant for me, lately, to be reminded by my morning newspaper that the "Agricultural Gang Act" had come into operation. Many readers of the papers, especially in towns, would pass this announcement with little notice. But to those who know the real state of England it proclaims a mighty change. It not

only proclaimed freedom to thousands of little English children in certain rural districts, but also ordained the establishment of due decency in various agricultural labours. On New Year's Day in the present year this Act came into operation. It was among the last of those passed by Parliament in the previous year (August 15th, 1867, was its date), and will very greatly affect the social condition of a large proportion of the rural population in six English counties. These are the counties of Norfolk, Suffolk, Lincolnshire, Huntingdonshire, Cambridgeshire, and Nottinghamshire, with portions of Bedfordshire, Northamptonshire, and Rutland, forming a district of seven

hundred thousand acres of the richest land in England. And it is this Eastern district, which has maintained a system which is as near to slave-driving as one pea is to another, and which is not handed down to us through the dark ages as a relic of villeinage, or even of that slavery which preceded villeinage in this country, but which is the growth of the present century of boasted enlightenment. For the agricultural gang system, to which my newspaper intelligence referred, is nowhere older than sixty years, and in many places is only half that age; and yet, it was not till 1843 that Parliament made an attempt to deal with the subject, and then, upon failing, allowed it to slumber for four-and-twenty years, while the system was daily taking deeper root and extending its noxious influence over a wider area.

But the Parliament of 1867 took the matter vigorously in hand. The debates in the House of Commons, on February 26th and March 1st, were succeeded, in three weeks' time, by the production of the careful and elaborate report of the Commissioners who had been appointed to inquire into the working of the "public" agricultural gangs—as distinct from the far more numerous "private" gangs which at this present time are being investigated by the Commissioners. This report, and the subsequent debates upon it, led, on August 15th, to the passing of the Act for the regulation of agricultural gangs, which took effect on January 1st, 1868. This Act, besides providing for the licensing of gangmasters in a way that should insure for the future a more respectable class of people being appointed to the office, abolishes the abominable evil of the "mixed gang," by enacting that no females shall be employed in the same gangs with males, or under a male gangmaster, unless a female licensed to act as "gangmaster" is also present with the gang. And another important step made by this Act is to snatch little children from the gangmaster, and thus to confer freedom on many hundreds of white slaves in modern Arcadia. For it enacts that no child under the age of eight years is to be employed in a gang; and to estimate the value of this, it must be borne in mind that six is a very common age at which to be at work in a gang, and that one of the commissioners (Mr. White) mentioned the case of a girl of four years being thus employed. Such children, then, are now freed from that cruel bondage to which they were condemned, not only physically but morally. The same strong arm of the law that dragged them out of the dismal depths of the coal-mine, and protected them in the factory, and is only withheld, it is to be hoped, for a short season from equally protecting them in the brickyard, has now taken the little white slave from the power of the English slave-driver. For this gang-work is really slave-driving, call it by what other name we may; and one woman, whose evidence is printed in the Blue-book (p. 92), and who had herself worked in a gang, bore this emphatic testimony: "I call it no better than negro-driving or slavery, and can't think it anything better. If a person came from a foreign country he would think the same."

This Act, I may remark, is to be accepted as an instalment of the full measure that will doubtless be passed when the inquiry into private gangs has been completed, with its cognate subjects of the educational and domiciliary condition of the people. The Agricultural Employment Commission has issued a paper of questions, which, if carefully and correctly answered, will prove of the utmost value in influencing legislation on this all-important subject.

That such "white slaves" existed in England was a fact scarcely known out of the Fen districts of our eastern counties; and even when made known was scarcely credited, or deemed to be greatly exaggerated, until the very full and exact report of the commissioners established the fact beyond dispute. It is unnecessary to say more of that report in this place, or to describe the composition and occupations of an agricultural gang, and the many evils and abuses which the system naturally engenders, because this has already been done by a competent pen in previous pages of this journal.* I therefore restrict myself to taking up the thread of the narrative where it was dropped, and can now congratulate the little white slaves of modern Arcadia, that the legislature has interfered in their behalf; that, even now, wise heads and warm hearts are labouring for them; and that, instead of being dragged up, as has hitherto been their lot, they will be properly brought up and duly educated. Their case is peculiar; and, happily, it is also peculiar to one district in England. The English Fen-men were always regarded as a peculiar people; so much so, that the old monkish chroniclers gravely spoke of them as being made differently from other men, having yellow bellies and web feet, and therefore specially adapted to fill that amphibious station in life to which they had been called. It was of these Fen-men, or *Girvii*, that the learned Camden said, "They are a sort of people (much like the place) of rugged, uncivilized tempers, envying others whom they term Upland-men, and usually walking aloft on a sort of stilts"—just as the peasants of Les Landes do over their sandy flats. It was probably from this practice that the alliterative nick-name of "Cambridgeshire camels" was given to the Fen-men, the other epithet, "Fen sloggers," being distributed over a wider area. Just as the Sussex girls were said to obtain their long limbs from their early exercise of pulling their feet out of the stiff mud in the notorious boghole described as "the Sussex bit of road," so these Fen-men, in accommodating themselves to the exigencies of their position, would appear to have developed to the stilt condition, in anticipation of the Darwinian theory. Any way, they were a peculiar people. It would be interesting to tell what the perseveringly-practical Romans did for them in making, through their quaking territory, drains and solid roads, such as the Ermyne-street and Carr-dyke—traces of which remain to this very day—and furthermore helping them in "banking" the fens. It would be interesting to describe these ancient fen works, and to tell what was achieved in later times by the formation and sustentation of the great "Bedford Level" by Sir Cornelius Vermuyden, the Dutchman, and his successors Westerdycck, Dodson, Scotton, Kinderley, Rennie, Walker, and others. Then there was the drainage (in 1850-1) of the largest southern English lake, Whit-tlessea-mere, on which Canute and his children were so nearly shipwrecked, and its conversion, with all its adjacent waters, swamps, and rough fen into rich corn-fields and pastures, from which the tall chimney of Easton and Amos's centrifugal pump rises like a triumphant column. It would be interesting also to narrate the more recent triumphs of Mr. Hawkshaw and his fellow engineers in preventing those fat fen pastures from being reclaimed by the sea, in "the Middle Level Deluge" of May, 1862. Despite these successive victories of enterprise and science, the Fen-men of the nineteenth century were still to be regarded as a peculiar people, who inhabited a peculiar district, and cultivated it in a peculiar way; and this way was by means of the gang system.

* See "The Leisure Hour," June 29, 1867, p. 413, for "Rural Labour Gangs," in which article the Blue-book of 150 folio pages is condensed.

The Bishop of Ely, in his primary charge in 1865, especially directed the attention of the clergy and laity to the evils resulting from the maintenance of the system; and it is to the clergy and laity of his diocese that the commissioners were chiefly indebted for the great mass of testimony with which their report was weighted, and for the flood of light that has now been thrown on this dark subject. The unanimity of testimony was indeed striking. Even the class which supported the existence of the gang system could say but little in its favour; though even to it a few conservative rock-limpets are found to cling, with a tenacity worthy of a better cause. For example, the only professed representative of the tenant-farmers of England in the House of Commons—although he admitted that much of the Blue-book evidence was correct—denounced, at a meeting of the Chamber of Agriculture, held at Norwich, October 12th, 1867, the talk about Fen gangs as "sentimental twaddle"—asserted that the sexes could not be separated in field-labour, and also stated that "if there was a girl who was good for nothing, she was the girl who went to field-work:" which was a very significant fact, that went far to prove the necessity for the abolition of the employment of girls in gang-work, which the speaker was advocating. Of course he denounced compulsory education; as also did a Mr. Smith, who, when speaking on this subject at the Shropshire Chamber of Agriculture, December, 1867, said that farmers did not want their labourers and ploughboys taught to read and write, for they did very well as they were; and, if they were sent to school, they might have them turning round on their masters, like trade unionists or Manchester Fenians—a sentiment that was lustily cheered by an audience of upwards of 300 farmers, who, we may hope, are not the representatives of the agricultural mind. Cowper, in his humorous verses on "Tithing-time," asks—

"O why are farmers made so coarse?"

and he might have made the adjective somewhat stronger, if the gang-system had existed in his day. It would have afforded him a fresh theme in his vigorous denunciations of slavery, to know that there existed in his own country, and even in many of the scenes through which his well-loved Ouse,

"Slow winding through a level plain
Of spacious meads, with cattle sprinkled o'er,
Conducts the eye along his sinuous course,
Delighted." (*The Task*, Book I.)—

that there existed in those spacious meads a system which supported white slaves, for no other reason than because it ministered to the money-getting means of the unscrupulous seeker after wealth. We can well imagine how the Christian poet would have lashed the supporters of the gang system, or held them up to scorn with that biting irony with which he depicted the highly-respectable individual who owned he was "shocked at the purchase of slaves," and greatly pitied them for what they suffered, but was compelled to be "mum" on the subject, because of the sugar, rum, tea, and coffee that their labours procured for him, and also because he went "snacks" in the riches obtained "by purchasing blacks." And so with the farmer whose field has been quickly and cheaply cleared of its twitch by the nimble fingers of the little white slaves, goaded to rapid work by the whip or stick of their gang-master. Although the farmer, who may be an affectionate father and a respectable man, may not altogether approve the gang-system as a whole, yet he is content to do as his neighbours do, and to follow the custom of the country; and thus, like Cowper's youngster at school—

"He blamed and protested, but join'd in the plan;
He shared in the plunder, but pitied the man."

But, now that legislation is holding forth its powerful shield for the protection of our little white slaves, we may say, as Cowper said elsewhere with regard to slaves, that Britannia, from this time, "resolves to have none of her own." For the present, however, we must bear in mind that the gang-system is only crippled, and not crushed. There are things that still stand between it and extinction—the law of settlement; the migration of the male population; the facility of procuring from "open" parishes persons who can perform the lighter labours of a farm; and, above all, the lack of cottage accommodation in the sparsely-populated Fen districts. Two thousand cottages are needed; and, as they cannot be raised in a day, a temporising policy is forced upon us for the next few years.

This increase of cottage accommodation for farm-labourers, which would strike at the very root of the gang system, is precisely the method recommended some five-and-twenty years ago by the Highland Society, for an analogous evil in certain Scotch counties—the bothy and the bondager system. These bondagers, who are found in north Northumberland, in Roxburghshire, Berwickshire, and other southern counties of Scotland, are great strapping girls, who are hired and "bound" by the twelvemonth to the labourer or "hind," who, in fulfilment of the "conditions" or mutual agreement between himself and his employer, is compelled to supply such a bondager, and to give her board and lodging for a twelvemonth, the lodging usually being a shelf in that filthy cupboard known as a "box-bed," which takes up the one side of his one-roomed cottage. The obvious evils of such a system, fostered and augmented by the fact of the bondagers being, in the majority of cases, young unmarried women, were paralleled in the mixed gangs, which by law were abolished last New Year's Day. And the bondagers, too, are essentially white slaves, quite as much so as are the members of a Fen gang during the time they are subject to the control of their gangmaster; so that, in the Lowlands of Scotland, and in the low lands of eastern England, we meet with the white slaves of modern Arcadia.

There are other great social revolutions affecting the population of towns, such as the New Factory Regulation Acts, which may afterwards be considered. But at present we confine our view to what most concerns the rural districts. This Act on agricultural employment, even as it now stands, is the most important law for eastern England, passed for the last forty years. But the commissioners are engaged in further inquiries, directed to education and house accommodation; and the whole will undoubtedly be of higher importance than any inquiry during the present century.

THE MIDNIGHT SKY AT LONDON.

MARCH.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

A BRIEF explanation of the seasonal changes in the positions of the fixed stars with respect to the meridian or horizon at any stated hour, will probably be acceptable to some of our readers. Before describing, therefore, the appearance of the midnight sky of March, we will, in a few familiar words, endeavour to state the cause of these seasonal changes in the apparent positions of the stars. We shall suppose that our readers are so much acquainted with astronomy as to know that the earth revolves on its axis in about twenty-four hours, and that a civil day is measured by the time elapsed between

two successive transits of the sun over the meridian of any place. We shall also assume that the cause of the daily or hourly changes in the positions of the stars with respect to the meridian are generally known to be simply the result of the diurnal motion of the earth on its axis. Were the time of rotation exactly twenty-four hours of solar time, there would be no seasonal changes; for then any one star would culminate at the same hour throughout the year. But the interval between two successive returns of any fixed star to the same meridian is smaller by several minutes than that given by consecutive transits of the sun. Hence we have the sidereal day and the solar day. Now, we wish to explain briefly the cause of this difference. In the interval between two successive transits of the sun, the earth has traversed through about one degree of its orbit; this makes a corresponding apparent change in the position of the sun in the heavens from west to east. The effect of this is, that the earth has to make rather more than one revolution on its axis before the centre of the sun can again coincide with the meridian. This is, however, not the case with the stars. Their distance from us is so great that these daily changes in the position of the earth in her orbit have no effect on their apparent movements. The interval of time, therefore, between two successive transits of any star is a sidereal day, and marks the time occupied by the simple diurnal rotation of the earth. Now, a sidereal day being shorter than a mean solar day by nearly four minutes, it will be evident to every one that when any star passes the meridian at midnight on any day—say March 15th—it will on March 16th pass about four minutes before midnight, and on March 17th eight minutes before that hour, and so on. From this it will be seen that in course of time the star will pass the meridian at a much earlier hour, till it is lost in the daylight. After the lapse of one year exactly, it will again culminate about midnight on March 15th. What is done in the case of one star, is done for all, as their relative positions are always the same.

By a comparison of our diagrams for March with those for January and February, these apparent movements of all the stars from east to west can be readily distinguished. Taking Regulus as an example, it will be perceived that this bright star at midnight in January is some distance east of the meridian; in February it is nearly in the centre of the diagram, or near the meridian; while in March it is considerably to the west. In like manner, all the stars in the south diagram have changed their positions in the same direction, some having disappeared in the west and south-west, while others have become visible in the east and south-east. If we wish to examine the heavens at an earlier hour than midnight—we will suppose eight o'clock in the evening—the observer has nothing more to do than to take the January diagrams, with the accompanying explanation, when he will be able to identify the principal stars in the same manner as at midnight in January. Again, if at ten o'clock in the evening, the February diagrams will be perfectly available for the purpose. For instance, Castor, Procyon, and Pollux are due south at midnight in January; in February they will be in a similar position at ten o'clock, and in March at eight o'clock.

Returning to the midnight sky of March, and remembering that the centre of the upper portion of the diagrams is directly over the head of the observer, we will direct our attention, in the first place, to the sky south of the zenith. Several stars of the first magnitude will be at once noticed in different directions. Due west, rather more than half way towards the

horizon, Castor and Pollux can be distinguished above any other object near them. It so happens, however, that if we draw an imaginary line from east to west through the zenith, Castor will be found to be in the northern division of the heavens, and Pollux in the southern. In our illustrations, therefore, Castor is inserted in the north diagram, while Pollux remains in the south. Proceeding towards the horizon in the W.S.W., Procyon, near the western limit of the diagram, is still shining brilliantly. Near the zenith, a few stars in Ursa Major can be easily identified. These, with the exception of Cor Caroli, are the brightest stars in a considerable region south of the zenith. The great constellation Ursa Major, if we except the well-known seven stars in Charles' Wain, is not celebrated for the possession of many stars of large magnitude. Nearly one half of Ursa Major is now south of the zenith. In the south-west, nearly midway between the zenith and horizon, Regulus is visible as the brightest star in that neighbourhood. Between Regulus and the meridian the space is occupied by the constellation Leo, Denebola being at the extremity of the lion's tail, and exactly on the meridian. South-east of Leo is the small constellation known as Sextans, with no star greater than the fifth magnitude; and lower down in the same direction is the rambling, tortuous Hydra, which extends from near Procyon along the whole lower portion of the sky near the south horizon. Its brightest star, Alpha Hydræ, or, as it is sometimes called, Alphard, can be easily distinguished at some distance below Regulus by the considerable space surrounding it unoccupied by any star approaching to it in magnitude. The small constellations, Crater and Corvus, on the back of Hydra, are now near the meridian, Crater being a little to the west, and Corvus to the east. Corvus will be found with little difficulty, its four principal stars forming nearly a square at no great distance from the horizon, between Spica and the meridian.

East of the meridian several important constellations and well-known stars are sure to attract our notice. Nearly over head, at a short distance from the zenith, the tolerably bright star Cor Caroli shines in a neighbourhood chiefly occupied with small objects. Passing the eye downwards, a little to the east of the meridian, we come to Coma Berenices (Berenice's Hair.) It is not difficult to notice this group of small stars, situated exactly midway between Cor Caroli and Denebola. A considerable portion of the south-east sky is occupied by Virgo, with Spica, a star of the first magnitude, and several of the third. One of these stars is near the meridian, immediately south of Denebola. This is known by the name of Beta Virginis. In the space between Denebola and Spica there are four other stars in Virgo, which form, with Beta, very nearly two sides of a right-angled triangle. The star next to Beta is Eta, then Gamma, a celebrated binary star, then Delta, the last being Epsilon Virginis. South-east of the corner star of this triangle the position of Spica is pointed out. East of Spica, near the south-east horizon, two bright stars in Libra have just risen. Nearly midway from the zenith to the horizon, in the W.S.W., Arcturus and several stars of the second and third magnitudes, in the constellation Boötes, are conspicuous objects; while about half way between the zenith and horizon, looking due west, the interesting group in Corona Borealis can be distinguished by its principal member, Alphecca or Gemma. Below Boötes and Corona Borealis, Serpens and portions of Hercules and Ophiuchus are visible, the last constellation occupying the eastern horizon.

At midnight, in March, the following are the principal

constellations above the horizon in the southern half of the sky: Cancer, Leo, Virgo, Libra, Canis Minor, Hydra, Sextans, Leo Minor, Crater, Corvus, Boötes, Serpens, Coma Berenices, and parts of Ursa Major, Corona Borealis, Hercules, Ophiuchus and Gemini.

Though Cancer (the Crab) is one of the most insignificant of the signs of the zodiac, with respect to bright stars, nevertheless it contains several very interesting objects, which are visible only through good telescopes. Among these is Zeta Cancræ, a fine triple star near the hind claws of the Crab. Two of the stars are very close, and afford an excellent test of the power and goodness of the object-glass of an astronomical telescope, as these stars require one of the best quality to separate them. The third star is at no great distance from the other two. It has been found that the two close stars revolve around each other in about sixty years, while the outer one takes five hundred years to perform its revolution around the others. It is thus evident that these objects are not simply in juxtaposition optically, but that they belong to one system. A small nebulous-looking object in the Crab's body, visible to the naked eye on very brilliant nights, is known by the name of the Præsepe, or the Beehive. This remarkable cluster, when viewed through a telescope of low power, is resolved into an aggregation of small stars. It has been specially noticed by the ancients, particularly by the Greek philosophers Theophrastus and Aratus, who have told us "that its dimness and disappearance during the progressive condensation of the atmosphere were regarded as the first sign of approaching rain." It was formerly supposed that this group consisted only of three nebulous stars, which emitted that peculiar light alluded to by old philosophers. The Præsepe is, however, rather scanty of stars if we compare it with many other clusters; but soon after the invention of the telescope Galileo counted thirty-six small stars in the group. Cancer contains several good double stars, which are always interesting objects to the astronomer, though, from their small magnitude, some of them are scarcely visible to the naked eye.

The sun enters Cancer on June 21st; this constellation is consequently the first of the summer signs of the zodiac. The sun at that time is at its greatest north declination, the north pole of the earth being turned towards it at its greatest inclination; we have therefore the longest day in the northern hemisphere. In all countries south of the equator, however, the shortest day will take place at this time.

One of the finest constellations included in our diagram for March is undoubtedly Leo, the fifth sign in the order of the zodiac. Leo is bounded on the north by Leo Minor, west by Cancer, south by Sextans, and east by Virgo. It is wholly situated west of the meridian, excepting Denebola, which is almost due south. The principal star, Regulus, is also designated Cor Leonis, or the Lion's Heart. This star was considered by the ancients as truly royal. By the Arabs it was denominated a "fiery trigon," or lion's heart, as well as a kingly star. Wylliam Salysbury, writing in 1552, tells us that "the Lyon's herte is called of some men the Royall Starre, for they that are borne under it are thought to have a royall nativitee." This royal star can be easily found in the diagram, by the help of which there will be little difficulty in finding it in the heavens. The principal stars in Leo form a large trapezium, consisting of Regulus, Gamma Leonis, a most beautiful double star, Delta Leonis, and Denebola. This trapezium can be readily found by reference to the universally-known pointers in the Great Bear, which serve to indi-

THE MIDNIGHT SKY AT LONDON, LOOKING NORTH, MARCH 15.

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, MARCH 15.

cate the position of Polaris in one direction, as we have before remarked, while the same line produced in the opposite direction will pass through Leo. There are a great number of interesting telescopic objects in this constellation, visible with the aid of ordinary instruments, especially double and variable stars. One of the latter, R Leonis, is remarkable for its blood-red appearance, which is very striking to the eye when viewed through a good telescope.

If we again refer to the upper diagram, we shall find that the appearance of the northern sky at midnight is sensibly different from that at the corresponding time in the preceding month, although, in consequence of the stars being for the most part circumpolar, many of the constellations may not appear to have changed their positions to any great extent. Over head, a part of Ursa Major is on the meridian, the pointers Dubhe and Merak being a little west of it, while the remaining stars in Charles' Wain are approaching the meridian. Rather more than one half of this constellation is north of the zenith, including all the principal stars. Looking due west, Castor and Pollux are visible, Castor being north of the imaginary line separating the two halves of the sky. Pollux, as we have before mentioned, has not yet passed into the northern half, though it is on the point of doing so. The principal constellations between Castor and the north horizon, in this part of the sky, are Auriga, Perseus, and Cassiopeia. The two bright stars rather more than midway between the zenith and horizon, in the north-west, are Capella and Beta Aurigæ. Lower down, approaching the north, is Perseus, with its group of moderately bright stars, amongst which is the variable star Algol, in the head of Medusa; and near the north meridian, about twenty degrees above the horizon, the group of bright stars in Cassiopeia, below Polaris, can be easily recognised. On the eastern side of the meridian, below Ursa Major, the stars in Ursa Minor and Draco are clearly seen; below these is the constellation Cepheus. In the north-east, the brilliant Vega is the most conspicuous object, followed at some distance by Alpha Cygni. Hercules is in the W.N.W., about midway between the zenith and horizon. Polaris is of course sensibly in the same position as in February. The use of this star in navigation is supposed to have been first recommended by the Greek astronomer Thales, and was very anciently known by the name of Phœnice. The poet Dryden has described the infancy of navigation, as practised by the adventurous seamen of Phœnicia:—

"Rude as their ships were navigated then,
No useful compass, or meridian known;
Coasting they kept the land within their ken,
And knew no north but when the pole-star shone."

For splendour, no star can bear the least comparison with the planet Venus, which during this month is a most brilliant object in the western evening sky. On the first day of the month she will set below the horizon three and a half hours after the sun, this interval of time increasing gradually to more than four hours at the end of March. Universal interest is always created in the popular mind when Venus is in this position, though, when she is a morning star, we have frequently considered her to be a still more magnificent object, owing, perhaps, to the clearer state of the atmosphere in the early morning. At such times the light of Venus is so intense, that a sensible shadow is produced by the interposition of the finger before a piece of white paper. At these epochs of great brilliancy she has frequently been observed with the naked eye within an hour of noon.

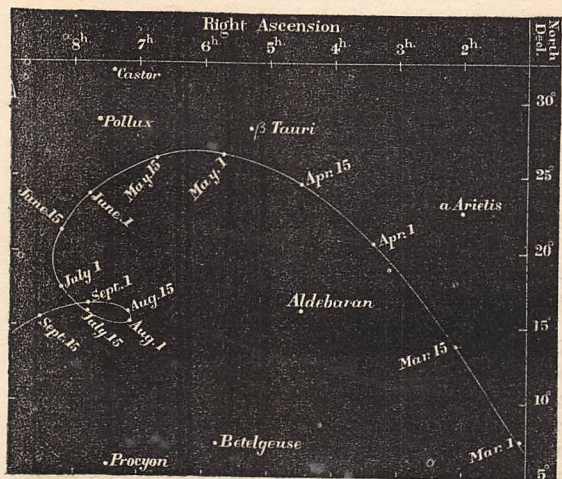

Without entering into much detail, a few remarks on

the appearance and position of Venus in the solar system will probably be interesting. The order of the planets from the sun, omitting the hypothetical Vulcan, is as follows:—Mercury, Venus, the Earth, Mars, the group of minor planets, Jupiter, Saturn, Uranus, and Neptune. Venus is, therefore, the second planet from the sun, around which she revolves in an almost circular orbit interior to that of the earth. The time occupied in her revolution is about 225 of our days; consequently, the inhabitants of Venus enjoy a year about two-thirds as long as ours. The mean or average distance of this planet from the sun is sixty-six millions of miles; and when she is in a direct line between the earth and the sun, or at her least distance, she is about twenty-five millions of miles from us. When near her extreme elongation east or west, she is always seen to the best advantage with the naked eye. She will be in that position, or greatest eastern elongation, on May 7th, 1868. Her greatest apparent brilliancy will, however, take place a month later, when she will be rapidly approaching towards her least distance from the earth. Venus is now truly the evening star, or the Hesperus of the old philosophers. When she is a conspicuous morning star, the ancients have given Venus the name of Lucifer, or the harbinger of day. Let us now, in imagination, direct a telescope to this favourite planet on any day in March, 1868. Instead of viewing a globular object similar to the large and distant planets, we find a gibbous one, in form precisely similar to the moon when between the first quarter and the full. This is owing to a considerable portion of the illuminated disk being turned from us. In short, the phases of Venus and the moon are produced by analogous causes, depending entirely on their relative positions with respect to the sun and earth. The telescopic appearance of Venus is therefore like a miniature moon, sometimes round, then gibbous, and finally a crescent, so fine, directly before conjunction, as to appear like an illuminated hair. As a rule, the crescent form takes place at inferior conjunction, the half illuminated disk at the time of elongation, and full at superior conjunction. The apparent magnitude of Venus varies considerably, according as her distance from the earth increases or diminishes.

The diameter of Venus is 7510 miles, being slightly smaller than that of the earth. She revolves on her axis in about 23h. 21m., thus making the day shorter than ours by a small quantity. Although Venus is now and then comparatively so near us, we know but little of her actual surface, principally owing to her intense brilliancy, which dazzles the eye of the observer. With regard to the two intra-terrestrial planets, Mercury and Venus, it is supposed that they are globes formed similarly to our earth, and illuminated and warmed by the sun. It is believed, also, from special observations of the physical appearance of the surface of Venus, that clouds prevail; if so, there must be water, and probably an atmosphere. This hypothesis would seem to be partially borne out by a phenomenon observed during the transit of Venus across the sun's disk in 1761. While projected on the sun, the planet appeared surrounded by a faint nebulous ring, and at the moment when Venus left the sun, a luminous ring was observed in the same place. These two phenomena could be easily explained, if we suppose the globe of Venus to be surrounded by a very dense atmosphere. Farther than this, the most powerful instrument of the astronomer is unable to add to the little knowledge we possess of the actual formation of these intra-terrestrial planets. Of their peculiar motions in the heavens with respect to the fixed stars, and their effect on each other by their mutual attractions, the

results obtained from modern astronomical observations leave but little more for us to learn.

The change of position of Venus in March and April among the stars is very rapid. A general idea of the amount of this change can be gathered by a reference to the small accompanying diagram, in which a few of the principal stars near the path of Venus are inserted, as an easy means of identifying the planet's position. The following explanation of the diagram will serve not only at present, but also for any future one of the same kind which we may find it necessary to insert. The figures above the diagram represent the right ascension, or the distance in time from the vernal equinox, or, as it is technically called, the first point of Aries. From this point all angular distances in this direction, or right ascensions, are measured along the celestial equator. The figures at the side represent the declination, or the angular distance measured perpendicularly from the celestial equator. Right ascensions and declinations serve the same purpose for distinguishing the positions of celestial objects, as longitudes and latitudes define the positions of places on a terrestrial globe or map.

APPARENT PATH OF VENUS.

During the month of March, 1868, the principal planets, excepting Venus, are very unfavourably situated for observation in the evening hours. The moon, on the 1st and 2nd, is in Taurus, near the bright star Aldebaran; on the 3rd in Gemini; on the 4th in Cancer; from the 6th to 8th in Leo; from the 9th to 11th in Virgo; on the 12th and 13th in Libra. During the remainder of the lunation she rises after midnight. The young crescent moon at the end of the month will again be in Taurus and Gemini. On the 28th the moon and Aldebaran will be very close until moonset.

Mercury sets on the first of the month, about 6.47 p.m.; this planet is not, however, likely to be seen to advantage, as it is rapidly approaching the sun. Venus is the evening star of the month, as we have previously described. This planet sets on the 1st at 9.8 p.m., and at 10.40 p.m. on the 31st. On the 27th the moon and Venus will be in conjunction, the moon being nearly seven degrees south of the planet. Mars and Jupiter set nearly with the sun, consequently they cannot be seen during March. Saturn is a morning star, rising after midnight till the 20th, and after that day before midnight. During the morning hours Saturn is a conspicuous object in the south-east.

The illustrations of the midnight sky for March will be equally available for 10 p.m. on April 15th; for 8 p.m.

on May 15th: for 6 a.m. on December 15th; for 4 a.m. on January 15th; and for 2 a.m. on February 15th. Our complete series of diagrams will therefore represent the visible heavens in the latitude of London for every evening or night hour throughout the year.

CURIOSITIES OF PADDINGTON.

BY JOHN TIMES.

I.

"Pitt is to Addington,
As London is to Paddington."—Canning.

THIS parish, which is a very small one, is named from the Saxon *Pædingas* and *tun*, the town of the Pædings, according to Kemble's "Saxons in England." Its early history is much controverted. The "Great Charters" of King Edgar and Dunstan, professedly granting lands to the monks of Westminster, are proved to have been the fabrication of monks who lived long after the death of the king and the bishop; the hand-writing of the charters is of a later period than the time when the grants are supposed to have been made, and the phraseology is partly Norman. There is no account of the Abbey possessions in Domesday Book. We know from Fitzstephen, that an immense forest, "full of the lairs and coverts of beasts and game, stags, bucks, boars, and wild bulls," existed early in the twelfth century at no great distance from what then constituted London. Only small portions of this forest were then the property of the Crown. It formed part of the public land, in which the citizens had free right of chase, preserved by many royal charters; it was disafforested by Henry III. in 1218. During the Saxon period there were few fixed indwellers in the forest. The Fleeta, the Tybourn, and the Brent were the three noble streams which carried the waters from the hills north of the Thames through this forest to the great recipient of them all; and upon the banks of those streams it is probable the Saxons early settled. The roads made through the forest united in this spot, and, having served the purpose of a military way to conduct the Roman Legions, were now ready for the uncultivated Saxons. This locality is the present site of Paddington, then the Saxon *Pædingas*. The district would appear to have been cleared soon after the Norman Conquest, from the vast forest of Middlesex (with pasture for the cattle of the villagers, and the fruits of the wood for their hogs), and to have lain between the two Roman roads (now the Edgware and Uxbridge roads), and the west bourne or brook, the ancient Tybourn, which has degenerated into the Ranelagh sewer.

In the first authentic document (31 Henry III.), Richard and William of Paddington transfer their "tenement" to the Abbot and Convent of Westminster, they having purchased the right which they could not legally inherit by their former charters; and from the close of the thirteenth century the whole of the temporalities of Paddington (rent of land, and young of animals, valued at 8*l.* 16*s.* 4*d.*) were devoted to charity. Tanner speaks of Paddington as a parish in the time of Richard II.; and by the "Valor Ecclesiasticus" of Henry VIII. the rectory yielded, like the manor, a separate revenue to the Abbey. Upon the dissolution of the Bishopric of Westminster, the manor and rectory were given by Edward VI. to Ridley, Bishop of London, and his successors for ever: they were then let at 41*l.* 6*s.* 8*d.*, besides 20*s.* for the farm of "Paddington Wood," thirty acres.

This is the earliest authentic information which the painstaking Mr. Robins was enabled to discover

relative to the Abbey lands in Paddington, when he wrote his "Paddington, Past and Present," in 1853. In his preface he acknowledges two derivations of Paddington—one suggested by Mr. B. H. Smart, the well-known philologist, from *Padre ing tun*, the father's town meadow; and the other from Sir Harry Dent Goring, of Bayswater House, who writes:—"A Pad is a Sussex word now in common use for pack-horse. '—ings' we have in that county by hundreds. Now the carriers to the great city may have lodged, and had meadows for their pack-horses here; I humbly suggest, therefore, may not Paddington mean *the Village at the Pack-Horse Meadows*?" We, however, incline to Mr. Kemble's *Paddingas and tun*.

Walter, the Abbot of Westminster, who purchased the Paddington soil, gave the manor for the celebration of his anniversary, which was entrusted to the almoner: he was to find for the convent fine manchets, cakes, crumpets, cracknells, and wafers, and a gallon of wine for each friar, with three good pittances, or doles, with good ale in abundance at every table, and in the presence of the whole brotherhood; in the same manner as upon other occasions the cellarer was bound to find beer at the usual feasts or anniversaries, in the *great tankard of twenty-five quarts*. The Dean of Peterborough, however, turns the wine into beer, and makes the tankard hold twenty-five gallons. The almoner had also to provide abundantly for the guests that dined in the refectory, bread, beer, and two dishes out of the kitchen, besides the usual allowance. And for the guests of higher rank, who sat at the upper table, under the bell, with the president, ample provision was made, as well as for the convent; and *cheese was served on that day to both*. And, as bread was given *ad libitum*, we find in this document the real origin of the term *Bread and Cheese Lands*, which is still applied to a small portion of that which was "the Paddington Charity Estate." In accordance with this usage, until the year 1838, bread and cheese were thrown from the steeple of St. Mary's Church, to be scrambled for in the churchyard.

On this feast-day all comers had meat, drink, hay, and provender of all sorts, in abundance; and no one, either on foot or horseback, was denied admittance at the gate. The nuns of Kilbourne had also extra bread and wine, and provisions from the kitchen. The poor, too, had a refecton on this day, of a loaf of the weight of the convent loaf, of mixed corn; also a pottle of ale, and two dishes from the kitchen. There was likewise allowed mead to the convent for the cup of charity, the *loving cup*, and five casks of the best beer were to be provided for this anniversary, which was, however, afterwards modified to singing, chiming bells, two wax candles kept burning at the tomb of Walter; and bread was distributed to the poor, but no alms. This retrenchment was necessary, else the convent would have been ruined by anniversaries, almost every abbot having one. In the twelfth and thirteenth centuries there were unseemly disputes between the Abbots of Westminster and the Bishop of London. On one occasion the abbot had to give the bishop the manor of Sunbury, and the church to the Chapter of St. Paul's; the monks of Westminster did not at all relish this arrangement; and one, more outspoken than the rest, openly declared that "Peter had been robbed to pay Paul." At this time (1291) the land in Paddington paid only fourpence per acre per annum rent.

Water was about this date (1236) brought to the City from Tyburn, for payment of which privilege foreign merchants gave the sum of one hundred

pounds. In 1439, the Abbot of Westminster granted to the mayor and citizens of London a head of water, and all its springs in the manor of Paddington, for which the City paid, on the Feast of St. Peter, two peppercorns: hence Bayard's watering-place, and Bayswater. Part of the great main pipe of lead which conveyed water from this place to the City conduits, was discovered during the repavement of the Strand, in June, 1765; and as late as 1795, the houses in Bond Street, standing upon City lands, were supplied from Bayswater. Two of the original springs on Craven Hill were covered in as late as 1849. The conduit on the site of Conduit Street was supplied from the same source; it was built in 1718, and remains of it were found in 1867 in excavating large wine cellars.

Among the notable persons who held lands in Paddington were Sir Reginald Bray, who came into possession of property by a Star Chamber decision; also Margaret, Countess of Richmond, mother of King Henry VII, who left ten pounds per annum to the poor. Another landholder was Lord Sands, who, with Thomas Hobson, the Cambridge carrier (whose choice is still a proverb), exchanged lands with Henry VIII; and the manor of Chelsea, with those lands in Paddington, which had belonged to Lord Sands, were settled on Katherine, the widowed queen of Henry VIII. Of the Countess of Richmond's grant to the poor Mr. Robins asks: "Where is that large estate in Paddington, which was valued in her grandson's reign at the exact amount she left to the poor?" Denis Chirac, jeweller to Queen Anne, built a large house on Paddington Green. Lord Craven in 1665 gave a piece of ground in the parish of St. Martin's-in-the-Fields, as a burial-place during any future Plague. This being covered with Carnaby Market, and other buildings, the ground was exchanged for a field upon the Paddington estate, which, if London should ever again be visited by the Plague, would be still subject to the said use. The land, however, was not used during the cholera of 1848 and 1849; and at the present time a grand London square, called Craven Gardens, indicates the site of the Paddington pest-house fields.

The history of the charity lands in Paddington has some curious details. Thus, here are three parcels of bread and cheese lands, given by two maiden gentlewomen for supplying the poor with bread and cheese on the Sunday before Christmas. Neither the names of the donors nor the date of the gift is known; but it is a very ancient one: one piece is let to Samuel Cheese. The bread and cheese is no longer thrown from the church among the poor assembled in the churchyard, but the bequest is distributed in bread and coals at their houses. The bread and cheese was bequeathed by two women who had been almost starved, but came to better fortune; still the distribution became a nuisance, and the Sunday before Christmas became a sort of fair day for the vagabonds of London, who came to Paddington to scramble over dead men's bones for bread and cheese. The village Green at Paddington has been wasted to its present dimensions. Chatelain's prints of the Green in 1750 and 1783, show it to have been "eight acres," which it would puzzle a present inhabitant to identify. Here were erected, during the Commonwealth, one of those detached ramparts, which they built up by the side of every entrance into the capital. The neat little gardens of the almshouses, built in 1714, have disappeared, and what remains of the Green is inclosed, or *iron-bound*, in every direction. The Paddingtonians laboured hard to save their Green in 1841;

they offered the bishop and his lessees £3,500 for a piece of ground west of the churchyard, for which the builders had a mind's eye. Four thousand pounds, however, was the lowest sum to be taken for this portion of the old Green; the vestry were obliged to be content with the southern portion, for which the parish paid £2,000. The northern was sold to one of the large capitalised builders, and is now covered with houses; while, on that portion bought by the parish, is built the new vestry hall; "to lay," says Mr. Robins, oddly, "if possible, the ghosts which are said to have haunted it." Hard by, in Dudley Grove, was modelled and cast the colossal bronze statue of the Duke of Wellington, by M. C. Wyatt; it is thirty feet high, was conveyed from the foundry upon a car, drawn by twenty-nine horses, September 29th, 1846, and cost altogether some £30,000. Westbourne Green has been cut up by the Great Western Railway; and Westbourne Place, built with the materials of old Chesterfield House, Mayfair, has disappeared. Here lived the brave soldier, Lord Hill, and at Desborough Lodge, in the Harrow Road, lived Mrs. Siddons, the celebrated actress. The railway terminus has altogether changed the face of this quarter of Paddington: its most magnificent feature is the hotel, designed by Hardwick, in the style of Louis XIV; it has more than 130 rooms, and is said to be a success, though it remained some three years before a tenant could be found for it.

The Paddington estate, or the manor and rectory, is of the value of three-quarters of a million sterling, and dates from 1753, when Dr. Sherlock was Bishop of London. It has a strange history, which Mr. Robins has unravelled: one of its proceedings is the sale of hereditaments and premises by two Oxfordshire ladies, for *ten shillings a piece!* The Grand Junction Waterworks were originally established to supply this estate with water at ten per cent. less than could be supplied by others; they have on Campden Hill a storing reservoir containing 6,000,000 gallons. Next was formed the Grand Junction Canal at Paddington, joining the Regent's Canal, which passes under Maida Hill by a tunnel 370 yards long. On the banks of the canal, the immense heaps of dust and ashes once towered above the house-tops, and were of fabulous value. Maida Hill and Vale, by the way, were named from the famous battle of Maida, in Calabria, fought between the French and the British in 1806.

The Paddington Canal, more of a "silent highway" than the Thames, affords summer recreation to many an over-worked artisan. From the basin are passage-boats to Greenford and Uxbridge, which carry many a holiday freight on this *still* voyage from the turmoil of the great town, to enjoy the pleasant prospects of Surrey, with its spires and well-clothed heights, not forgetting the beautiful foliage of Box Hill, and the more distant Leith Hill, with its old prospect-tower. At Paddington, too, is "a boatman's chapel," on ground leased to the Grand Junction Canal Company. This place of worship, to hold 200 persons, was constructed out of a stable and coach-house, so as to afford the poor boatmen the inestimable advantages of religious instruction.

ALONE AT SEA.*

I INTENDED to start with any freshening breeze, and to get into Littlehampton for the night; therefore the small anchor and the hemp cable were used, so as to

be more ready for instant departure; and well it was thus.

Time sped slowly between looking at my watch to know the tide change, and dozing as I lay in the cabin—the dingey being of course astern; until in the middle of the night, lapsing through many dreams, I had glided into that delicious state when you dream that you are dreaming. On a sudden, and without any seeming cause, I felt perfectly awake, yet in a sort of a trance, and lying still a time, seeking what could possibly have awakened me thus. Then there came through the dark a peal of thunder, long, and loud, and glorious.

How changed the scene to look upon! No light to be seen from the Owers now, but a flash from above and then darkness, and soon a grand rolling of the same majestic, deep-toned roar.

Now I must prepare for wind. On with the life-belt, close the hatches, loose the mainsail, and double reef it, and reef the jib. Off with the mizen and set the storm-sail, and now haul up the anchor while yet there is time; and there was scarcely time before a rattling breeze got up, and waves rose too, and rain came down as we sailed off south to the open sea for room. Sea-room is the sailor's want; the land is what he fears more than the water.

We were soon fast spinning along, and the breeze brushed the haze all away, but the night was very dark, and the rain made it hard to see. Now and then the thunder swallowed all other sounds, as the cries of the desert are silenced by the lion's roar.

In the dark a cutter dashed by me, crossing the yawl's bows, just as the lightning played on us both. It had no ship-light up, shameful to say. I shouted out, "Going south?" and they answered, "Yes; come along off that shore."

The breeze now turned west, then south, and every other way, and it was exceedingly perplexing to know in time what to do in each case, especially as the waves became short and snappish under this pressure from different sides; and yet my compass quietly pointed right, with a soft radiance shining from it, and my mast-light in a brighter glow gleamed from behind me* on the white crests of the waves.

One heavy squall roughened the dark water, and taxed all my powers to work the little yawl; but whenever a lull came or a chance of getting on my proper course again, I bent round to "East by North," determined to make way in that direction.

In the middle of the night my compass lamp began to glimmer faint, and it was soon evident that the flame must go out. Here was a discomfort; the wind veered so much that its direction would be utterly fallacious as a guide to steer by, and this difficulty would continue until the lightning ceased. Therefore, at all hazards, we must light up the compass again. So I took down the ship-light from the mizen shroud, and held it between my knees that it might shine on the needle, and it was curious how much warmth came from this lantern. Then I managed to get a candle, and cut a piece off, and rigged it up with paper inside the binnacle. This answered for about ten minutes, but finding it was again flickering, I opened the tin door, and found all the candle had melted into bright liquid oil; so this makeshift was a failure. However, another candle was cut, and the door being left open to keep it cool, with this lame light I worked on bravely, but very determined,

* "The Voyage Alone in the Yawl Rob Roy." By John Macgregor, M.A., author of "A Thousand Miles in the Rob Roy Canoe." London: Sampson Low, Son, and Marston.

* It was hung on the port mizen shroud. To hang it in front of you is simply to cut off two of your three chances of possibly seeing ahead.

for the rest of my sailing days to have the oil bottle always accessible. Finally the wind blew out the candle, though it was very much sheltered, and the ship-light almost at the same time also went out suddenly. Then I lay to, backed the jib, opened the cabin hatch, got out the oil, thoroughly cleaned the lamp, put in a new wick, and lighted it afresh, and a new candle in the ship's light; then we started all right once more, with that self-gratulation at doing all this successfully, under such circumstances of wind, sea, and rain, which perhaps was not more than due.

What with these things, and reefing several times, and cooking at intervals, there was so much to do and so much to think about during the night, that the hours passed quickly, and at last some stray streaks of dawn (escaped before their time, perhaps) lighted up a cloud or two above, and then a few wave-tops below, and soon gave a general gray tint to all around, until by imperceptible but sure advance of clearness, the vague horizon seemed to split into land and water, and happily then it was seen plainly that the Rob Roy had not lost way in the dark.

As soon as there was light enough to read we began to study Shoreham in the pilot book, and neared it the while in the water; but though now opposite the Brighton coast, it was yet too far away to make out any town, for we had stood well out to sea in the thunderstorm. All tiredness passed off with the fresh morning air, and the breeze was now so strong that progress was steady and swift.

It may be remarked how a coast often looks quite different when you are fifteen or twenty miles out at sea, from what it does when you stand on the beach, or look from a row-boat close to the land. So now we were puzzled to find out Brighton, one's own familiar Brighton, with its dull half-sided streets, neither town nor bathing town, its beach unwalkable, and all its sights and glories done in a day. We might well be ashamed not to recognise at once the contour of the hills, so often trudged over in square or in skirmish in the Volunteer Reviews.

The chain-pier was, of course, hardly discernible at a great distance. But the "Grand Hotel" at last asserted itself as a black cubical speck in the binocular field, and then we made straight for that; Shoreham being gradually voted a bore to be passed by, and Newhaven adopted as the new goal for the day.

We had shaken out all reefs, and now tore along at full speed, with the spray-drift sparkling in the sun, and a frolicsome jubilant sea. The delights of going fast when the water is deep and the wind is strong—ah! these never can be rightly described, nor the exulting bound with which your vessel springs through a buoyant wave, and the thrill of nerve that tells in the sailor's heart, "Well, after all, sailing is a pleasure supreme."

Numerous fishing-vessels now come out, with their black tanned sails and strong bluff bows and hardy-looking crews, who all hailed me cheerily when they were near enough, and often came near to see. Fast the yawl sped along the white chalk cliffs, and my chart in its glazed frame did excellent service now, for the wind and sea rose more again; and at length, when we came near the last headland for Newhaven, we lowered the mainsail and steadily ran under mizen and jib. Newhaven came in sight, deeply embayed under the magnificent cliff, which at other times I could have gazed on for an hour, admiring the grand dashing of the waves, and we had to hoist mainsail again, so as to get in before the tide would set out strongly, and increase the sea at the harbour's mouth every minute.

It was more than exciting to enter here with such waves running. Rain, too, came on, just as the Rob Roy dashed into the first three rollers, and they were big and green, and washed her well from stem right on to stern, but none entered further. The bright yellow hue of the waves on one side of the pier made me half afraid that it was shallow there, and, hesitating to pass, I signalled to some men near the pier-head as to which way to go, but they were only visitors. The tide strongly out, dead in my teeth, yet the wind took me powerfully through it all, and then instantly, even before we had rounded into quiet water, the inquisitive uncommunicative spectators roared out, "Where are you from?" "What's your name?" and all such stupid things to say to a man whose whole mind in a time like this has to be on sail and sea and tiller. I think that in a port like Newhaven the look-out man in charge ought to come to the pier-head when he sees a yacht entering in rough weather, and certainly there is more attention to such matters in France than with us.

During this passage from the Isle of Wight I had noticed now and then, when the waves tossed more than usual, that a dull, heavy, thumping sound was heard aboard the yawl, and gradually I concluded that her iron keel had been broken by the rock at Bembridge, and that it was swinging free below my boat. This idea added to the anxiety of getting in safely, lest such an appendage might touch the ground; and to make sure of the matter we took the Rob Roy at once to the gridiron, and laid her alongside a screw-steamer which had been out during the night, and had run on a rock in the dark thunderstorm. The "baulks" or beams of the gridiron under water, were very far apart, and we had much difficulty in placing the yawl so as to settle down on two of them, but the crew of the steamer helped me well, and all the more readily as I had given them books at Dieppe, a gift they did not now forget.

Just as the ebbing tide had lowered the yawl fairly on the baulks, another steamer came in from France, crowded with passengers, and the waves of her swell lifted my poor little boat off her position, and rudely fixed her upon only one baulk, from which it was not possible to move her; therefore, when the tide descended she was hung up askew in a ludicrous position of extreme discomfort to her weary bones; but when I went outside to examine below, there was nothing amiss, and gladness for this outweighed all other troubles, and left me quite ready for a good sleep at night.

TEETOTALISM.

In a speech delivered at Exeter Hall, shortly after his return from America, the Rev. Newman Hall drew a humiliating contrast between this country and the United States, in the matter of intemperance. He had seen less drunkenness during his whole stay in New York than he was accustomed to see in one night in Lambeth. One of the morning papers, in commenting on this speech, said that Mr. Hall had not seen the two countries under the same conditions. While giving Mr. Hall credit for good intentions, the writer spoke in a depreciating way of what is commonly called Teetotalism. Mr. Hall made the following manly and sensible reply:—

You do not agree with us, but you treat our question and ourselves with respect—treatment which we do not always receive, though it might be expected from all who can appreciate persevering labour prompted only by the desire to do good. There is much truth in what you say. During a portion of my visit I was "put through"—very kindly, yet "put through."

But during several early weeks of my tour I travelled unknown, saw a good deal of all classes of people, and had abundant opportunity of observing American hotel life. Also, when in the cities, being "put through," I made a point of exploring what we should call the lowest neighbourhoods, in order to compare the condition of the people with that of our own. I admitted in my speech that I had seen cases of drunkenness in various cities—also that a system of private drinking prevailed to a great extent; but still I testified that, as regards actual drunkenness, there is very far less of it in America than in Great Britain.

The result is that the working classes in America are much better off; not so much from high wages, which are set off by high prices, as from more temperate habits. It is not unusual for our artisans to spend five shillings weekly in beer. Many of them spend from ten to twenty shillings. How can their families be properly housed, clothed, and fed? How can provision be made for a season of scarcity and sickness? Who can doubt that much more than half the prevailing destitution of London at this moment arises from the drinking habits of the people? The poorest regions support gin-palaces in wealth and splendour. Wherever else trade is slack, it is plentiful there. We provide food, clothing, medicine for the poor; but if we could persuade them not to spend their money in beer and gin they would provide ten times more for themselves than all the combined charities of the empire. I could take you to a hundred families in one district in London, connected with one of our temperance societies, families living in comfort and happiness through total abstinence, who, a few years ago, were objects of charity, the wives and children being often at the point of starvation, and the men often in the hands of the police, through offences committed while drunk. Some of us think it a duty to send missionaries to the heathen. We also believe that the doctrines and precepts called the Gospel should be preached both at home and abroad. By those who do not share in these convictions we are reminded of the obligation to do good at home, and to benefit the poor physically and socially. This we are doing in various ways; but experience proves that we can do it no way so effectually as by inducing our working classes to abstain from the public-house. It is a fact that very few can visit such places without frequently drinking to excess, and always being in danger of moral injury. We find we cannot urge these persons to abstain from places where the drink is sold, so long as they desire the drink itself. To keep them from the beershop and the gin-palace it is necessary to persuade them to give up drinking altogether. But we have not the heart to ask them to make this sacrifice, essential for them, while not making it ourselves. So, to render our persuasions consistent and effectual, we voluntarily abstain, even though we may be morally sure that we could continue to drink in moderation and no evil result to ourselves. But we cannot ask a poor man to keep away from the public-house while we are enjoying our own wine at home. We are not fanatics nor bigots. We do not say that all intoxicating drinks are poison, or that it is wicked to drink a glass of wine or beer. We condemn none for acting on their own judgment. We wish to impose our own convictions on no one, nor make our conscience a standard for our neighbour. We simply say total abstinence is for some a necessity, and for the working classes as a whole would be an incalculable benefit, physical, social, and educational. We joyfully make the little sacrifice of abstaining, for the sake, if not of ourselves, as an example to others, to whom abstinence is a moral necessity. We do not dogmatise, but we endeavour to instruct and persuade. We show what evil the drinking system entails; we show what benefits have resulted from abstinence. We do not deny the existence of exceptional cases, in which wine, etc., may be needed medicinally; but we do invite all those who are able to abstain to share with us the great pleasure and privilege of promoting, by so trifling a sacrifice, the welfare of our fellow-creatures, and diminishing the poverty, crime, and misery which abound so fearfully from this cause.

In conclusion, I will remind you of a paper read before the Statistical Section of the British Association, by Mr. Porter, entitled, "The Self-imposed Taxation of the Working Classes." The calculation is for the year 1849. The quantity of spirits consumed within the United Kingdom was 22,960,000 gallons; the quantity drunk by the adult males was, on an average, each man in England, 2½ gallons; Ireland, 3½ gallons; Scotland, 11 gallons. The quantity of grain used in brewing and distillation was 4,749,000 quarters. The beer brewed was 435,000,000 gallons. And the cost—spirits, £24,000,000; beer, £25,380,000—making a total of nearly £50,000,000 sterling, most of which is spent by the working classes.

Varieties.

FARADAY AS A CHRISTIAN PHILOSOPHER.—Faraday was deeply religious; and not to insist on this special characteristic would be to make a very imperfect sketch of his life. His religious convictions occupied a large place in his whole being, and evinced their power and sincerity by the agreement between his life and his principles. It was not in arguments drawn from science that he sought the proofs of his faith; he sought for them and found them in those revealed truths which, at the same time, he held could not be reached by unaided human reason, even when they were in most perfect harmony with what he had learnt from the study of nature and the marvels of creation. Faraday had for long understood that the data of science, so changing and so variable, will not do for the firm and immovable foundation of a man's religious belief, but, at the same time, he had shown by his example that the best reply that a philosopher can make to those who hold that the progress of science is incompatible with these convictions, is to say to them, "But, notwithstanding, I am a Christian." The sincerity of his Christianity appeared as much in his acts as in his words. The simplicity of his life, the uprightness of his character, the active benevolence which he displayed in his relations with others, won for him general esteem and affection. Always ready to do an act of kindness, he would leave his laboratory when his presence would serve or be useful to the cause of humanity. He would willingly place his science under contribution, whether upon a question of public health and of industrial application, whether to give some practical counsel to an artisan, or to examine the discovery of a beginner in the career of science.—*Professor de la Rive, of Geneva.*

UNJUST TRADESMEN.—From one or two provincial shopkeepers we have received protests against some statements in our article on "Ready Money Housekeeping." If our correspondents lived in London, they would thank us for distinguishing between honest and dishonest dealers. What do they think of the following?—During the past year, remarks the "South London Press," 740 South London shopkeepers have been fined for using, or having in their possession, unjust weights, scales, or measures. The black list is made up as follows:—109 licensed victuallers and beer retailers, 73 bakers, 106 chandlers, 83 butchers, 76 greengrocers and coal dealers, 65 grocers and cheesemongers, 11 oilmen, 4 confectioners, 10 fishmongers and poulterers, 7 eating-house keepers, 5 corn chandlers, 13 marine-store dealers, 1 furrier, 2 curriers, 2 glue and size makers, 2 ironmongers, 3 ham and beef dealers, 2 leather merchants, 2 iron merchants, 1 flock dealer, 3 glass merchants, 1 coal merchant, 1 soap maker, and 8 general dealers. The total amount in fines was £1,070 15s. 6d. During the year 1866 there were 808 shopkeepers fined, which shows a decrease for the past year of 68.

ESQUIRE AND YEOMAN.—This latter name has a stalwartness about it that makes one use it with pride. *Esquire* is an addition now coveted. But Sir Thomas Smith's account of the names is not very flattering. In his "Commonwealth of England" (ed. 1621), he says:—"For amongst the Gentlemen they which clayme no higher degree, and yet bee to be accounted out of the number of the lowest sort thereof, be written Esquires. So amongst the Husbandmen, Labourers, the lowest and rascall sort of the people, such as bee exempted out of the number of the rascability of the popular, be called and written Yeomen, as in the degree next unto Gentlemen."

BOOKS PUBLISHED IN 1867.—During the past year there have appeared 4144 new books and new editions, which may be thus classified:—

Religious books and pamphlets	849	Poetry and the drama . . .	150
Minor works of fiction and children's books . . .	535	Science, natural history, etc.	133
Novels	410	Medical and surgical . . .	123
Annuals and serials (volumes only) . . .	257	Law	101
Travels, topography . . .	212	Trade and commerce . . .	63
English philology and education	210	Agricultural, horticultural, etc.	62
European and classical theology and translations	196	Illustrated works (Christmas books)	62
History and biography . .	192	Art, architecture, etc. . . .	53
Politics and questions of the day	143	Naval, military, and engineering	42
		Miscellaneous	352
		Total	4,144
Last year the total was 4,204.— <i>The Bookseller.</i>

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Courper.*

A SUSPICIOUS SAIL IN SIGHT.

THE MORTONS OF MORTON HALL.

CHAPTER XVIII. — THE GOOD SHIP AMAZON MEETS WITH A SUSPICIOUS-LOOKING CRUISER IN THE GULF OF MEXICO.

FAR away, "o'er the deep waters of the dark-blue sea," a gallant ship was fast approaching her port of destination.

After a passage of six weeks from the port of Southampton, the American packet-ship Amazon entered the Gulf of Mexico. She had met with stormy weather on her passage, and had lain becalmed. She had bounded lightly and swiftly over the water before favouring gales, and had been baffled by foul breezes;

and her passengers fancied that, short of shipwreck, they had experienced during their comparatively brief voyage all the various vicissitudes of ocean life.

Short-sighted mortals as they were! They had yet to encounter one deadly peril that had never entered into their calculations.

For some days past the weather had been extremely sultry, though the fresh sea air had prevented them from experiencing the depressing lassitude from which they, so lately arrived from a cooler region, would have suffered had they been on shore in the same low latitude. Awnings were spread over the poop and

quarter-deck; windsails were set in the cabin skylights, and in the companion-way and 'tween-decks, and every appliance for the purpose of creating a free current of cool air throughout the ship was resorted to. Passengers who had kept their cabins throughout the voyage now came on deck, and spent most of their time leaning lazily over the bulwarks and watching the vast fields of sea-weed of every curious and graceful form, and of every variety of hue, which had floated past the vessel since she had entered the Gulf Stream, and which stretched on every hand as far as the eye could reach.

During the hours of daylight the water sparkled brilliantly, and in the darkness of the night the whole ocean gleamed with the phosphorescent light emitted from countless myriads of animalculæ. Fishes of strange forms and brilliant colours skimmed near, or leaped playfully above the surface of the sea; birds of gaudy plumage flew off from the land and hovered around the ship, or lighted on the masts and spars to rest their weary wings; and the busy hum of insects blown off from the islands filled the air. The sky overhead, and the waters of the ocean beneath, were of a brighter, deeper hue than the sky and waters of the bleak North, and the glimpses caught of the distant shore, lined with cocoa-nut and other tropical trees, revealed a strange and novel description of scenery to most of the passengers on board. Earth, air, and water alike teemed with animal life, and everything, above, around, and beneath, betokened that they had entered the torrid zone.

It was Saturday night at sea—the last Saturday night that the passengers expected to spend on board the ship; for, if all went well with her, the good ship Amazon would, ere another Saturday came round, be snugly moored alongside the *levee* at New Orleans—the Crescent city, the commercial capital, and the great emporium of the Southern and South-western States of the American Union.

All day long the ship, borne slowly on her course by a light, fair breeze, had been skirting, though at a far distance, the north-western shore of the island of Cuba, and while the passengers had been gazing upon the delicate or grotesque outlines of the trunks and branches of the tropical trees, distinctly defined, notwithstanding the distance, through the clear atmosphere, against the bright blue sky, and watching the many novelties by which they were surrounded, the captain, to whom the scenery was familiar, had occupied himself in closely watching through his spy-glass the motions of a small vessel which was manœuvring close under the land between the ports of Matanzas and Havana.

There was nothing remarkable in the appearance of this vessel to the eye of an ordinary spectator, though a sailor or a yachtsman might well have admired the beautiful model of her long, low, black hull, unrelieved by a streak of colour, and the "tautness" and symmetrical proportions of her masts and spars, and the lightness and grace with which she "sat on the water, like a thing of life," scarcely seeming to need the guidance of the helmsman as she performed various evolutions, swinging round from tack to tack without making the slightest lee-way, and sailing, now before the wind, now almost "in the wind's eye," as though she were disporting on the water for very wantonness.

It was not these excellencies, however, which especially attracted the attention of Captain Dobson, though he had a sailor's eye for them too; and, while he admired them, had, perhaps, rather they had been wanting in the present instance. He could not understand what such a beautiful craft was doing off the Cuban coast, nor why those on board of her were thus

idly amusing themselves by testing or showing off her admirable sailing qualities; and, so far as he was concerned, he would far rather have seen a bluff, clumsy sugar-drogher in her place. To be sure, for ought he knew, she might be the Governor of Cuba's yacht, or a Spanish revenue-cutter, whose commander was exercising his crew; or, for the matter of that, she might be an English yacht, whose owner had chosen to take a trip to the Antilles. That she carried guns he was certain, since from time to time he could see their brass muzzles gleaming and shimmering in the bright sunshine; and moreover—and this caused him the greatest uneasiness—he fancied that he could discern a bulky object amidships on her deck, concealed beneath a cover, which might be but her long-boat, protected by a tarpaulin from the fierce heat of the sun, and might be a "Long Tom"—or, in other words, a long eighteen-pound swivel gun. She was but a tiny craft in comparison with his own bulky vessel. In a gale of wind he could have run her down, and have scarcely felt the shock, but she carried a sting, against which he had nothing to oppose; and if it were a "Long Tom" that she had on board, and she were inclined for mischief, he was well aware that she could sail round and round the Amazon with perfect ease, and completely disable her with her shot, without coming to close quarters, until all on board the vessel were entirely at her mercy.*

Captain Dobson consulted with his mate, and some of the older seamen collected in groups on the fore-castle and spoke in low tones and shook their heads, evidently entertaining strong suspicions of the honesty of the strange craft.

Both the captain and the mate went aloft and scanned the horizon with their glasses, in the hope of seeing some other vessel that might at least be some sort of protection in case of any hostile intention on the part of the stranger. The captain would have given a great deal to see a man-of-war—no matter of what nation—heave in sight; but, except the strange craft and the Amazon, not a sail was visible on all the wide expanse of ocean.

All this time the passengers remained in happy ignorance of the fact that the captain had any suspicion of danger near, and he would not needlessly alarm them by confessing his fears.

Still the strange vessel continued her apparently idle manœuvres—now standing out to a considerable distance from the land, as if to reconnoitre, and then again putting about and turning her prow towards the shore. It was this action on her part that rather inclined the captain to the opinion that she was really a Government vessel after all, and that the commander was either exercising his crew or looking out for some expected smugglers; and when at length, late in the afternoon, she set all sail and steered a due course for Havana, he was confirmed in his opinion and dismissed his fears. Long before darkness set in, the suspicious stranger was hidden from sight by the land, and, as Captain Dobson and his mate believed, was snug at anchor beneath the Moro Castle.

The light breeze, that had blown all day, dwindled away towards nightfall to an almost perfect calm. The fiery glare of the tropical sunset tinged the still waters

* Even as late as twenty years ago the West Indian seas, especially off the coasts of Cuba and Hayti, were infested by pirates in almost as great a degree as the islands of the East Indian Archipelago are to the present day. These pirates had their almost inaccessible haunts among the rocky, uninhabited islets of the Antilles, whence they sallied forth and attacked and plundered defenceless merchant ships, and often ill-treated, and sometimes massacred the crews. Small steam vessels-of-war, capable of following the marauders to their haunts, have, however, almost entirely driven these sea robbers from the western seas, where now a pirate vessel is rarely seen or heard of.

of the Gulf to a deep red hue, from amidst which danced and glittered myriads of phosphorescent sparks; and as the sun's last faint parting rays gleamed forth from the lurid clouds with a golden and purple light, and were reflected upon the white sails, which glowed as they flapped lazily against the masts as though they were wrapped in flames, the bold image of the poet appeared to be realised, and the Amazon lay, as it were,

"A painted ship, upon a painted ocean."

The night closed in rapidly, as night ever closes in within the tropics; but the passengers, who had been watching the gorgeous sunset, still lingered on deck, admiring the calm beauty of the scene. "Strike eight bells!" cried the officer of the watch; and the clear strokes of the ship's bell sounded strangely loud and distinct in the stillness of the night.

The watch was relieved, and then the captain spoke aloud. All his fears were dispelled, and his spirits had risen in the same proportion as they had fallen during the day.

"Ladies and gentlemen," he said, addressing himself to the passengers, "it is Saturday night—I hope and believe our last Saturday night at sea this trip. I invite you all down into the cabin. The night air, though it is almost motionless, is damp and chill after the intense heat of the day.

"Steward," he added, shouting down the cabin skylight to that important functionary on board a passenger-ship, "it is Saturday night. Let the hands have a double allowance of grog to-night, to drink to sweet-hearts and wives.

"Ladies and gentlemen," again addressing his passengers, "I shall expect to see you all in the cabin."

The passengers willingly accepted the invitation; and when they entered the cabin they found the table covered with champagne bottles and glasses, and with all the various delicacies that are provided for the refectory of passengers on board a first-class passenger-ship.

At the captain's request they seated themselves around the table, he, as usual, taking his place at the head.

"Ladies and gentlemen," he recommenced, "I beg—nay, on this occasion (glancing smilingly around at the ladies) I *insist*, that you all fill your glasses to the brim."

In a few moments nothing was heard but the popping of champagne corks, and the fizzing of the exhilarating liquor, as the steward and his subordinates rapidly filled the glasses.

When at length silence was restored, the cheerful songs of the sailors—who had immediately gone in for enjoyment, without waiting for ceremony—were audible through the open skylights from the topgallant-forecastle. One of the men was playing the violin, while, to judge from the measured tread, others of the merry crew were dancing to the music.

"Ladies and gentlemen," once more repeated Captain Dobson, as he rose from his seat, glass in hand, and looked smilingly around him, "the sailors, as you hear, have taken time by the forelock, and have already commenced to amuse themselves. I always, when the weather permits, give the poor fellows an extra allowance of grog on Saturday nights, to drink to 'sweet-hearts and wives,' especially when it is likely to be the last Saturday night of the voyage. And since I have had command of a ship—and that is a good many years now—I have ever made it a practice to assemble my passengers around me in the cabin on the last night at sea, to enjoy an hour's good-fellowship, and to wish success to the ship and to each other.

"I am but a rude sailor, and you must not expect any

oratory from *me*. If you do you will be disappointed; but I can say what I mean in my own plain way, perhaps better than I should if I tried to make a fine speech. We have been shipmates now for a period of six weeks, and, take it altogether, we've had a very pleasant time, and been very comfortable and friendly. I hope before the next Saturday night comes round to land you all safely at New Orleans. Meanwhile the worst part of the voyage has been safely made, and it's a common saying that we should praise the bridge that carries us safe over. Now, ladies and gentlemen, the old Amazon has brought you safe over the Atlantic, and into the Gulf of Mexico, and I ask you all to drink success to the good ship, and happiness to yourselves and to each other."

Much good "drinking success" was to do them!

Captain Dobson had just resumed his seat, and the passengers—one and all—had risen from their seats, glass in hand, to do the toast full honour, when the sudden silence of the men in the fore-castle caused them to start, and to stand still with their glasses raised half way to their lips.

A sudden silence is often more startling than is the sudden outbreak of noise; and the passengers glanced at each other with looks of wonder and alarm. At this juncture the mate entered the cabin, and, advancing to the captain, whispered in his ear.

Captain Dobson immediately set down his glass without having drank, and, telling his passengers to make themselves comfortable and he would rejoin them presently, he quitted the cabin with his mate.

Some of the ladies turned pale, and several of the gentlemen followed the captain to the deck, leaving their wine untasted.

"What can it mean—this sudden silence, and Captain Dobson's look of anxiety and alarm?" asked one of those who remained in the cabin.

"Perhaps the ship has run ashore, and we shall all be wrecked and drowned!" cried one of the ladies.

"Nonsense, my dear," said another; "when a ship goes on shore, she makes a great noise and cracks all her masts, and the water comes over in a green sea. I've read about such things often."

"I rather suspect," observed a very young gentleman of the party, "that there is a squall brewing, and that the captain has gone on deck to order the men to shorten sail. I've heard that the squalls in the Gulf of Mexico are very violent, as the calms are frequent."

"Then do pray go on deck, Mr. Talbot," said the lady who had last spoken, "and learn if such be the case, and then return and tell us what is the matter."

The young gentleman, thus appealed to, drank a glass of wine and went on deck, but he did not immediately return. There were matters going on which occupied all his attention; and though there was cause for suspicion, he did not think it yet necessary to alarm the ladies.

When Captain Dobson reached the deck a few moments before, he found the second mate and most of the sailors gazing earnestly over the starboard bulwark into the darkness, and apparently listening attentively.

"Whence came the sound you speak of?" he inquired of the mate.

"From over the starboard quarter, sir;—very faint, yet perfectly distinct."

"I hear nothing but the low murmur of the sea as it rises and falls. Are you sure that you heard the sound?"

"Perfectly sure, sir. Others heard it as well as myself—the measured pull of heavy sweeps. I could even hear the rattle of the rowlocks, and the dripping

of the water from the blades of the sweeps as they were lifted from the sea. Hark—there it is again!”

There could be no doubt about the matter now. In the profound stillness of the tropical night, the slow measured strokes of heavy oars were distinctly audible; and though the sound came evidently from a great distance, the air was so calm that the practised ears of the seamen were enabled to tell, from the peculiar dull “thud” that was heard as the sweeps turned in the rowlocks, that they were muffled.

“The sound comes from the direction in which we lost sight of the schooner just before dusk,” said the Captain, in a whisper, as if he were afraid of the sound of his own voice.

“When does the moon rise?” he asked anxiously. “If it be as I fear, in this thick darkness lies our only hope of escape.”

“At ten o’clock, sir,” answered the mate, in an equally low voice.

“In less than an hour,” continued the Captain.

“Would that a breeze would spring up—a gale. In a strong gale we might yet show our heels; but that schooner would run round us like a dolphin in light weather. Are all the lights out?”

“All, sir. We doused all but the binnacle-lamp when we first caught the sound.”

“That was right. Let some of the hands draw up the windsails, and cover the skylight with tarpauling as quietly as possible, so as to make no noise that may be heard at a distance in this calm, nor yet to alarm the ladies; and, Mr. Willis (to the second mate), go down into the cabin and tell the steward to see that all the state-room port-holes are closed, so that not a glimmer of light can escape from a chink. Make some excuse to the ladies. There is no occasion to alarm them yet.

“I don’t hear anything now, Mr. Adams,” continued the Captain, addressing the chief mate.

“No, sir. They’re resting on their sweeps. They evidently don’t know whereabouts we are.”

“Would it be possible, think you, to get at the guns?”

“Quite impossible, sir. The agent ordered them to be stowed at the very bottom of the hold, for ballast. We have nought but that pop-gun there aft, for firing signals, and I doubt whether we’ve powder enow on board to load the guns twice if we had ’em handy.”

“What folly! what madness! What is the use of carrying guns to be used as ballast?”

“Not much, sir; though, to speak my mind, I reckon if we had the guns on deck, it ’ud be the wisest plan to leave ’em alone. If there were any chance o’ fighting *fair*, I’d go in for fighting to the end; but we could do no good with two such guns as *we’ve* got, and with *our* crew, ag’in pirates; and if that schooner an’t a pirate, my name an’t Adams. We should only exasperate ’em to no arthly purpose, ’cept to make ’em cut our throats. If we make no useless resistance, they may take what they want and be off. And if it do come to fighting for our lives, we can make a stand to the end with the ship’s cutlasses and pistols.”

“And the ladies?”

“Ay. The women folk is orkard in such a case as this. To speak my mind, I’d go down and tell ’em what we expect, right away, and let ’em hide theirselves—stow theirselves away where best they may. Depend on’t that plan’s better nor tellin’ ’em at the last moment, when they’ll all be screechin’ and squallin’, and faintin’.”

“Not yet,” said the Captain. “We’ll not alarm them yet. Let us hope there may be no need. I don’t hear the

sweeps now, Adams. I haven’t heard ’em for some time. Maybe they’ve given the search up and gone back.”

“Don’t trust to that, Cap’n Dobson. Them chaps arn’t so easy shook off when they’ve once got scent of prey. They’re just lying by for the moon to rise, and then they’ll be down upon us like a streak of lightning.”

“It is hard to lie idle and make no preparations for defence against these desperadoes,” grumbled the Captain. “Your advice is good, Adams. I see too plainly that we can do nothing, even to defend ourselves; but if it were not for the sake of the women, I’d arm myself and the crew, and fight to the last.”

“Ay—there’s where it is,” replied the mate. “If ’t warn’t for the sake o’ the wimmen-critturs, I’d say fight till we die, sooner than give up the ship—tho’ fighting ’ud be o’ no arthly sarvice; but the women sort o’ par’lyses us. If we fit, it ’ud be the worse for *them*, and do ourselves no good.—There’s them sweeps agin.”

“Listen! The sound seems more distant. They’re surely pulling for the land again.”

“Don’t you b’lieve it, Cap’n Dobson. They’re just lost in the darkness, like ourselves. There! They’re silent again. ’Seems to me, Cap’n, there’s a catspaw of wind drawin’ from the south’ard.”

“How does she head, my man?” inquired the Captain, of the helmsman, still in a low tone of voice.

“She’s lyin’ her course now, sir; nor-nor west, and has steerage-way upon her.”

“That’s well, my lad; watch her close, and keep her sails full if you can,” returned the Captain.

Then, to the mate—

“Let them haul the main-tack on board, Mr. Adams, as quietly as possible. No shouting. If the breeze *would* but freshen, we might hope to escape yet.”

The mate shook his head.

“We shall have the moon in half an hour,” he replied, “and that dangerous crittur arn’t a mile off, I reckon.”

The main-tack was quietly hauled on board; but the breeze did *not* freshen. The ship just held steerage-way, and that was all.

And now again all was silent. The watch-below, and most of the male passengers, were on deck; but not a man raised his voice above a whisper, and many held their breath as if they feared that might be heard to their harm, though every ear was stretched to catch the slightest sound that came across the water. There was something awful in the profound silence—only broken by the occasional splash of a fish which had leaped into the air and fallen back into the water—that reigned amidst the thick darkness of a tropical night, when the moon and stars are shrouded from view.

Just before dark a thin film of cloud had overspread the sky, and all over head was wrapped in gloom; and there was something far more terrible than would have been the actual sight of danger, in the dread suspicion, the almost certainty, of an unseen peril, which could neither be escaped nor boldly confronted, and the extent of which no one knew.

The pirates, if pirates they were, might be content with plunder, and they might massacre all on board, even in cold blood. Their treatment of their helpless victims depended more upon their humour at the moment than upon aught besides. The passengers were panic-struck—they knew not rightly what to dread; while the officers and crew felt somewhat like

the unhappy victims confined in the Conciergeries during the Reign of Terror in France—they might be simply plundered of all they possessed, and then set free; or they might be sacrificed to the savage whim or vengeance of the moment. Like those poor victims of lawless authority, they knew that they were helplessly, hopelessly, in the power of their enemies.

Even now, the ladies in the cabin knew not what was really wrong on board; for all that has been told occurred within a comparatively short space of time after the Captain had suddenly quitted the cabin. They knew that *some* danger was apprehended, but had no idea of the nature of the peril.

Thus another quarter of an hour passed away, and still the same mysterious quietude reigned around. Many of the crew, and even the Captain himself, reassured by the long-continued silence, began to think, or at least to hope, that their ears had been deceived, and that their fears were but a nightmare, caused by the schooner that had alarmed them by her appearance during the day. The mate, however, persisted that there had been no deception in the sound that had awakened the alarm, and was still confident that danger was at hand. At the end of this period a faint glimmer of light tinged the verge of the horizon, away on the vessel's starboard beam.

"The moon! The moon!" whispered the Captain, and the whisper went round among the crew.

All felt that their doubts and fears would now be speedily dispelled, or their peril fully realised; and soon a crescent of fire appeared above the water's edge. Gradually it rose higher and higher, dissipating as it rose the thin film of cloud that had hitherto obscured the sky, until its entire disc was displayed—not the pale, watery orb of the temperate and frigid zones, but the full moon of the tropics, appearing like a ball of white flame suspended in mid air between earth and heaven, and illuminating the sea and sky with almost the glare of daylight.

A searching glance was cast around the horizon by all on deck, and then a thrill of terror struck every heart; for there, perhaps a mile distant, and between the ship and the land, lay the schooner that they had lost sight of just before dark. All her sails were furled now, and nothing was visible but her low, black hull, and tall, slender masts, with all their delicate tracery of rigging and cordage, appearing fine as a spider's web, yet distinctly defined in the bright moonlight, against the dark-blue sky. Motionless she lay on the glittering water, as though she were at anchor. Not a soul was visible on her decks through the night-glasses of the ship; and, so still she remained for several minutes after she became visible, that many on board the Amazon began to doubt whether the intentions of her crew were really so evil as they had imagined them to be.

Perhaps her captain was conscious that the prize was in his power whenever he chose to pounce upon her, and, like a cat with a mouse, was amusing himself with the fears of his intended victim; or perhaps he was doubtful as to the Amazon's powers of resistance.

Presently, however, two or three dark forms were seen on the schooner's deck; then these increased, until the decks appeared crowded with men; and still the vessel lay motionless upon the water, until suddenly—almost as if by magic—two rows of long, slender, black sweeps bristled from her sides, and were presently set in motion. She suggested the idea of a centipede, with her long, low, black hull, and rows of sweeps on either side, and looked fully as spiteful, and much more dangerous, than the venomous insect, as she came

creeping along, slowly and steadily, towards her helpless prey.

When, however, she was still half a mile distant from the ship, the wind, which had been for some time dallying with the sails, freshened into a breeze. Instantly the schooner's sweeps were drawn in-board, her sails were set, and she bore swiftly down upon her intended prize. She now hoisted Spanish colours, and, when within hailing distance, rounded to, and a voice called upon the captain of the Amazon to heave to, and send a boat on board.

To this command no reply was made, and the next moment a shot was fired from the schooner, which passed over the ship's deck and cut away a portion of her main rigging. Even before this act of violence, it was manifest to all on board the Amazon that escape by flight was hopeless, since the schooner sailed with twice the speed of the heavy-laden ship; and before the echo of the report had died away, a voice hailed again from the schooner in good English—

"Do you surrender? It will be better for you. If you offer no resistance, we pledge ourselves to do you no harm."

"I have no alternative," shouted Captain Dobson, in reply. "My ship is utterly defenceless."

It appeared as if a consultation were being held on board the schooner, as though her crew were still doubtful.

Presently the same English voice hailed again—

"Send a boat on board, with an officer and six of your crew, in token of surrender, and we will do them no injury; otherwise we will hull you with the next shot."

That the pirate would speedily fulfil his threat, none who listened doubted; but none were willing to place themselves in his power. At length the mate said—

"The rascal will fire and sink us in less than five minutes. We'll be as safe on board the schooner as here, for that matter. I'll go in the boat if any six will follow me."

Some whispering occurred among the crew, and then six men stepped forth and expressed their willingness to man the boat, which was immediately lowered and pulled alongside the schooner. The men were ordered to ascend to the deck, and were instantly secured, and then the pirates sheered their vessel broadside on to the ship, and their captain, followed by a party of men, sprang on board and took possession of their prize.

The crew and passengers of the Amazon, with the single exception of the captain, were roughly ordered below, and the hatches were closed upon them; but, while they were obeying the order, an elderly seaman from the schooner approached the Captain, and said, in a low voice—

"I am a countryman of yours—the only one on board: all the rest are Spaniards and niggers. You did well to surrender. Make no resistance, and our young captain will offer no violence. It is lucky for you that he, instead of the old man, is in command."

"I *can't* offer any resistance," replied the Captain, sulkily, "or I would not have allowed you to come on board so easily."

The old seaman smiled.

"I was compelled to join the schooner," he went on, "and I dare not leave her, or I should not be here now. Mind what I've told you, and our captain will protect you and all on board from personal injury. But don't anger the *men*. They're an ill lot, and I mayn't get a chance to speak to you again."

The captain of the schooner—a young and not ill-

looking man, attired in a sort of naval uniform, whose manner and appearance were singularly at variance with the rough, scarred, repulsive-looking men who comprised the majority of his crew—now approached, and civilly requested Captain Dobson to precede him into the cabin.

FINANCIAL NOTABILITIES.

BY THE AUTHOR OF "LONDON SCENES AND LONDON PEOPLE."

WE sometimes use an odd metaphor, which is yet well understood, and speak of individuals "born with silver spoons in their mouths"—the fortunate few who inherit wealth without working for it—and now we propose to chronicle some names of persons fated to gold spoons, whether from inheritance or successful industry. Riches are a source of power. They elevate their possessors to a sort of pedestal, and, more than the bishop's lawn, the physician's cane, or the judge's wig, exercise undisputed influence. Whether wealth is equally certain to yield happiness is more doubtful. This depends on the use, not the possession of wealth. The name "miser" is expressive. A thoroughly penurious rich man is a miserable fool, while his benevolent brother millionaire may be a kind of earthly Providence. Here are a few specimen gold spoons.

Abraham Newland, a cashier of the Bank of England, whose name for a long series of years was synonymous with a bank note, realised a large fortune. He retired in 1807, after a service of more than half a century, his last business act being to decline a pension offered him by the directors. He died within a few months, leaving funded property amounting to £200,000, and a landed estate of £1000 per annum. This fortune was not derived from his salary. In his time Government loans were frequent. A portion was always reserved for the cashier (a Parliamentary report mentions £100,000), and the profits were often very great. The Goldsands were then lenders on the Stock Exchange. They contracted for most of the loans, and to each of the family Newland left £500 to purchase a mourning ring. It was surmised at the period that Newland made large advances to the Goldsands, and reaped proportionate profits. Mr. Newland resided for a considerable portion of his life on Highbury Place, and was remarkable for his frugal habits. He commonly walked to his duties at the Bank, only riding when the weather was unfavourable. The meanest clerk in the establishment would now hardly think of walking there. Mr. Henry Hase succeeded him as cashier, and was equally the theme of ballad-singers; but he does not seem to have realised so large a fortune. Connected with this period the following anecdote is worth preserving. A banker's clerk robbed his employers of £20,000 in Bank of England notes. He disposed of them to a Dutch Jew. For six months they remained untraced. The Jew then came to the Bank and demanded payment, which was refused, on the plea that they had been stolen. The man, who was known to be immensely rich, went quietly to the Exchange, and, before a large assembly of citizens, declared that the Bank authorities had refused to honour their own bills; that, in fact, they had stopped payment. He declared he would immediately advertise the fact. Public credit was not then above suspicion, and the money was paid. We find another strange story in some of the journals of that day. A director had occasion for £30,000—he required it to pay for landed property. He exchanged cash at the Bank for a note of that value. Returning home, and being called out, he placed the note on the chimney-piece in his counting-house,

and when he came back it had disappeared. The conclusion was that it had fallen into the fire. The other bank directors, believing this, gave him a second note, but took no obligation to be responsible for the first. Thirty years afterwards, the person in question having been long dead, an unknown individual presented the lost note for payment. He said it had come to him from the Continent. It was payable to bearer, and the money was obtained. The heirs of the director would not make restitution; but it was soon afterwards discovered that an architect, having purchased the director's house, had pulled it down, had found the missing note in a crevice of the chimney, and had defrauded the Bank of the money. The story is possible, but not probable. No names are given, and no sufficiently lucid explanation of the strange disappearance of the note.

In 1701, a systematic series of frauds on the public funds, by means of circulating false reports relative to the war in Flanders, were seriously detrimental to the public credit. Sir Henry Farmer, then a bank director, employed his great fortune in this unworthy manner. He maintained couriers throughout Holland, Flanders, France, and Germany. He was the first to receive news of the fall of Namur, and was presented by William III with a diamond ring, as a reward for important intelligence. But he fabricated news, and originated various fraudulent despatches. Prices were often lowered four, or even five per cent. in a single day, and his profits were enormous. Medina, a wealthy Jew, accompanied the Duke of Marlborough in his campaigns, and fed the avarice of the great captain by an annuity of £6000 for the right of sending off expresses from the fields of Ramilies and Blenheim; and those victories conducted as much to fill the Hebrew's purse as to extend the national glory.

So low was public credit, that Walpole's axiom, that every man had his price, was generally believed; and bribery became universal. Of five millions granted to carry on the war, only two-and-a-half reached the Exchequer. The House of Commons declared by a solemn resolution: "It is notorious that many millions are unaccounted for." Mr. Hungerford was expelled for accepting a bribe of £21; the Duke of Leeds was impeached for taking one of 5,500 guineas. The price of a Speaker—Sir John Trevor—was £2,005. Officials lent the Exchequer its own moneys in fictitious names; and out of forty-six millions raised in fifteen years, twenty-five millions were unaccounted for. Perhaps we are now almost as much astonished at the smallness of the sums then raised for public purposes, as at the wholesale frauds practised.

Thomas Guy, who founded the hospital so named, in 1724, was the son of a poor lighterman. He began life with a few shillings, and ended it with probably a million sterling. His profits were made by dealing in sailors' tickets. Charles II paid them with inconvertible papers, which the poor men were forced to sell at any discount. The usurer at Rotherhithe robbed them of nearly the whole of their hard-earned wages. Strange that a fortune so iniquitously raised should have been devoted to so noble a purpose!

Sampson Gideon, the great Hebrew broker, and the founder of the house of Eardley, died in 1762. His name was once as familiar as Goldsmid and Rothschild now. He was a shrewd, sarcastic man, and possessed great richness of humour. "Never grant a life annuity to an old woman," he would say; "they wither, but they never die." If the proposed annuitant coughed, he would call out, "Ay, ay, you may cough, but it shan't save you six months' purchase!"

Snow the banker; spoken of by Dean Swift, lent

Gideon £20,000. Soon after, the young Chevalier landed, and Snow piteously entreated the return of his money. Gideon procured twenty £1,000 notes, rolled them round a phial of hartshorn, and returned them to the banker. The Pretender, being on his march to London, stocks were sold at any price. Gideon went to Jonathan's, a coffee-house then much used by dealers in bullion, bought all the market, advancing every guinea he possessed, and pledging his credit for yet further purchases. His profits were enormous. "Gideon is dead," writes a contemporary, "worth more than the whole land of Canaan. He has left all his milk and honey, after his son and daughter and their children, to the Duke of Devonshire, without insisting on the duke taking his name, or being circumcised." His views were liberal, for he left £2,000 to the sons of the clergy, and £1,000 to the London Hospital.

In 1785, Mathewson, thought to be of Scotch origin, appeared to be an exceedingly bold speculator; yet he acted with judgment, for he possessed £500,000 at his death. He was occasionally very eccentric. At a dinner party, he turned to a lady sitting next to him, and said, "If you, madam, will trust me with £1,000 for three years, I will employ it advantageously. She knew him, and accepted his offer. In three years to the very day Mathewson waited on the lady with £10,000, for he had increased her loan to that amount.

The names of Abraham and Benjamin Goldsmid will be long remembered, and a few old men amongst us may recollect their features. They rose from obscurity to be the chief authorities in the Alley. In 1792 they rose into importance. They were the money-brokers who competed with the bankers for the Government loans. They were unboundedly munificent. The poor of all creeds were their pensioners; one day they entertained royalty; the next they paid a visit of mercy to a condemned cell. They were for a while fortune's chief favourites. Everything prospered with them. Ultimately a tremendous reverse awaited them; and Abraham destroyed himself at his country house, Merton. Benjamin Goldsmid made a bold stand against his troubles, but his friends did not yield him the support he expected; and, after entertaining a large party at dinner, he also destroyed himself in the garden of his noble mansion in Surrey.

The Rothschilds hold a high place among financiers, and their history is interesting. Nathan Meyer Rothschild's father was a learned archæologist, and the family have been remarkable in all the cities of the Continent. The first important success of Meyer Anselm, the head of the house, has been ascribed to his possession of the fortune of the Landgrave of Hesse Cassel, which he saved from the hands of Napoleon I. "The prince," said Rothschild "gave my father his money; there was no time to be lost; he sent it to me, and had £600,000 or more unexpectedly sent by post; and I put it to such good use, that the prince made me a present of all his wine and linen."

Nathan Meyer Rothschild (according to his report) came to Manchester because Frankfort was too small for the financial operations of the brothers. It showed great courage to settle there. Though absolutely ignorant of the English language, on a Tuesday he said he would go to England, and left Germany on the following Thursday. He commenced business with £20,000, and quickly tripled his capital. In 1800, finding Manchester too limited a sphere of work, he came to London. He realised vast profits; power of will and readiness of action were his characteristics. Having bought some bills of the Duke of Wellington at a discount, to which the

credit of the State was pledged, he made arrangements to purchase gold to pay them. He was informed "Government needed it," and Government obtained it, but paid freely for the assistance. "It was the best business I ever did," he exclaimed; adding, "and when they got it, it was of no use, until I had undertaken to convey it to Portugal." In 1812, Meyer Anselm died at Frankfort, and Nathan Meyer Rothschild became the head of the family. Before his time foreign loans were unpopular in England, as the interest was made payable abroad in foreign coin. He introduced the payment of the dividends in London, and fixed it in sterling money—a chief cause of the success of such loans. Although termed only a merchant, the Stock Exchange was the scene of his triumphs; and no doubt he manipulated the public funds with shrewd skill, employing brokers to depress or raise the market, and making enormous purchases, in one day (it is affirmed), to the extent of £4,000,000. From 1819 his transactions pervaded the entire globe. With the profits on a single loan, he bought an estate which cost £150,000. Nothing was too large for his attention—nothing too minute. Yet it is affirmed he gave extremely small salaries to his clerks. Though apparently extremely bold in speculation, he must have exercised great caution, for none of the loans with which he was connected were repudiated at his office—a fair price might be obtained for any amount of stock; and it was not uncommon for brokers to apply to Nathan Rothschild, instead of going on the Stock Exchange.

In 1824 financial operations were so all-absorbing, that what Rothschild and other capitalists did, excited as much interest as the greatest public events. Once he was outwitted by a London banker; he lent him a million and a half on the security of Consols, the price being 84. The terms were simple: if the price fell to 74, the banker might claim the stock at 70. The banker began selling Rothschild's Consols, with a large amount of his own. The funds fell, and the unexpected price of 74 was reached—of course, with a heavy loss. On another occasion his master hand was manifest. Wanting bullion, he went to the governor of the Bank to procure on loan a portion of the superfluous store; an arrangement was made, he employed the gold, his end was answered, and the time came for the return of the specie; punctual to a moment, he tendered the amount in bank notes. The necessity for bullion was urged. "Very well, gentlemen, give me the notes. I dare say your cashier will honour me with gold from your vaults, and then I can return your bullion." If he possessed important news likely to cause an advance in the price of stock, he ordered his broker to sell half a million. Capel Court rung with the news, and the funds fell; a panic ensued and the price sunk 2 or 3 per cent. Large purchases were made at the reduced rates. Then the good news was known, the funds instantly rose, and an immense profit was the result. Of course he had reverses, and had enemies, who often threatened him with personal violence. Two strangers came into his office; he fancied they were searching their pockets for pistols; he hurled a ledger at the intruders, who were only seeking for letters of introduction. A friend said to him—

"You must be a happy man, Rothschild."

"Happy! me happy! why, just as I'm going to dine; I get a letter, saying, 'Send me £500 or I will blow your brains out!' Me happy!"

He was believed to sleep with loaded pistols under his pillow, and was in continual dread of assassination. The splendour of his residences and entertainments were ex-

traordinary, and he was the golden idol of all ranks. His mode of letter-writing bespoke a mind wholly absorbed in accumulating wealth, and his language under excitement was rude and violent. He was a frequent subject for caricature. Huge and slovenly of figure, his lounging attitude, as he stood against his favourite pillar in the Exchange, his foreign accent, and rude form of speech, often made him the object of ridicule. Though not remarkable for extensive benevolence, Dr. Herschell declared that Mr. Rothschild had placed a large sum in his hands, for the benefit of his poorer brethren. He died at Frankfort, and his remains were brought to England for interment.

These particulars, relative to Nathan M. Rothschild, are from various sources, but especially from the daily journals, and a work called "The Chronicles of the Stock Exchange," by Jno. Francis.* Here is a story worth transcribing:—

Last century was the hanging century. A great fraud, involving forgery, had been committed on the East India Company. The day of trial was near, and the leading witness against the accused was accustomed to visit a house near the Bank, to be dressed and powdered, according to the fashion in vogue. A note was handed him, setting forth that the attorney for the prosecution wished to see him at his private house in Portland Place. On arriving he was ushered into a large room, where sat several gentlemen, over their wine:

"There is a mistake," said he.

"There is no mistake," said one of them, rising. "I am brother to the gentleman soon to be tried for forgery, and without your evidence he cannot be convicted. The honour of a noble family is at stake. Your first attempt to escape will lead to a violent death. There is nothing to fear, but we must detain you till the trial is over."

The witness acquiesced; but, managing to escape, was pursued, and declared to be insane. A lady passing in a private carriage heard his story, and drove him to the Old Bailey, in time to give the necessary evidence, and consign the criminal to the scaffold.

Here is a companion tale:—A stockbroker, meditating suicide, was on his way to Bankside. A stranger accosted him, who had just landed from Brussels, and informed him of the victory at Waterloo. The ruined jobber hastily returned to Capel Court, and made large purchases of stock. As the news became known, the funds rose rapidly; and his profits amounted to £20,000.

William Coutts was an Edinburgh merchant. His sons came to London, and commenced banking in the Strand; and Thomas, on the death of his brothers, became the sole proprietor. He frequently gave dinners to the principals of similar firms. A guest told him that a certain nobleman had solicited for a loan of £30,000, and had been refused. Coutts waited on the peer, and requested him to call in the Strand, when he offered to discount his acceptance for the required sum.

"But what security must I give?" said his lordship.

"I shall be satisfied with an I.O.U."

£10,000 was received, and £20,000 retained as an open account. The money was soon returned. New customers abounded, and one of them was George III.

The father of Lord Overstone was a dissenting minister at Manchester. Mr. Jones, a member of his congregation, half banker, half manufacturer, had a daughter, who became intimate with Parson Lloyd, and married him. Jones was soon reconciled to his son-in-law; but, not thinking a preacher's business lucrative, made him his

partner. How he prospered need not be told. His son is now Lord Overstone.

The Founders of Barclay's house were linendrapers in Cheapside. On Lord Mayor's Day, 1760, George III paid a state visit to the City. There was a street tumult. A horse in the state carriage grew restive. The King and Queen were in danger, when David Barclay, a draper, came to the rescue, saying—

"Wilt thou alight, George, and thy wife Charlotte, and see the Lord Mayor's Show?"

Presently David introduced his wife after this manner—"King George of England; Priscilla Barclay, my wife," etc.

Barclay attended the next levee.

"What do you mean to do with your son John?" asked the King. "Send him to me, and I will give him profitable employment."

He declined the offer, but John and James became bankers in Lombard Street.

John Baring was a cloth manufacturer in Devonshire. Leaving a large fortune, Francis, his second son, became a banker. He reaped large profits from Government loans, and was created a baronet. He realised a fortune of £2,000,000. Alexander Baring succeeded him. His monetary operations were on a prodigious scale. On one occasion he lent the French Government £1,000,000 at five per cent. He was elevated to the peerage as Lord Ashburton. In 1809 six of the Baring family were in Parliament.

Mr. Morrison, for many years a tradesman in Fore Street, realised a fortune of £3,000,000. Hudson, one of our railway kings, was for a long time the golden calf of the multitude, and might, at one period, have commanded any number of millions. During the late terrible panic Overend, Gurney, and Company failed for £13,000,000; and a renowned baronet and M.P. stopped payment for above half that sum. Indeed, the figures now representing financial operations so far exceed those of former merchants and brokers, that their scale of business seems to have been comparatively small.

We have spoken of enormous financial operations here as a curious fact. By way of contrast, a few days since we were shown a penny Bank of England note. To facilitate some pecuniary arrangement (the transaction took place in the Bank parlour about forty years since), the words Five Pounds were crossed through, One Penny substituted, and an official signature appended. As a great favour, this unique penny note was parted with for forty shillings.

W. H.

IN THE WHITE SEA.

A NARRATIVE OF THE EXPEDITION IN SEARCH OF SHIP-WRECKED CREWS.

THE sad intelligence of the loss of a large number of ships by ice in the White Sea first appeared in the English papers about midsummer last year, and shortly afterwards official telegrams from Archangel confirmed the report. The number was estimated at one hundred, and the crews were said to be living either on the ice, or the bleak Lapland shore, in an almost hopeless condition. Having ascertained that the first vague statements were only too well founded—although the number of wrecked ships and suffering crews was afterwards proved to have been greatly exaggerated—the Government immediately chartered the two steam ships Montezuma and Brenda as transports, for the purpose of affording aid to all the shipwrecked mariners, irrespective of nationality.

* He was a bank clerk. His book went through several editions, and as his employers found no fault with his facts, they were probably true.

ICE-BOUND IN THE WHITE SEA.

Drawn by Commander May, R.N., from a sketch by Captain G. F. McDougall, R.N.

The steamers, at the time of their being chartered, at noon on the 29th of June, were lying in the Victoria Docks at Blackwall, without crews, coals, or stores of any description on board. By noon the next day they were moved to moorings off Deptford Dockyard—kept open by express order to expedite equipments—to ship provisions, clothing, medical comforts, and indeed all that thoughtfulness and experience could suggest, to render the distressed seamen comfortable on their way to their respective homes.

Each ship was under the direction of a transport officer, and two medical officers were also selected to accompany the expedition. The officers on board the Montezuma were Staff-Commander G. F. McDougall, of the hydrographical department, senior officer of the expedition, and Dr. Alexander Fisher, Surgeon; whilst on board the Brenda were Navigating-Lieutenant Benjamin Jackson, and Mr. D. B. Thomas, Assistant-Surgeon, all of Her Majesty's Naval Service.

On Monday, July 1st, the steamers left Deptford, and on the morning of the 3rd arrived off Sunderland in order to complete crews, ships' stores, etc., as well as to receive the latest information on the subject of their mission; and this, in the shape of a telegram from Archangel, was to the effect that, on the 29th June, "Masters of vessels arrived at Archangel reported large numbers of wrecks in neighbourhood of Ponoï River, and Sosnovets Island, on the western coast of the White Sea, and that one hundred vessels had been lost. Of the abandoned ships more than ten had been brought in by English crews."

During the evening of the 3rd July the ships left Sunderland, the Montezuma having embarked as passengers two gentlemen (Messrs. J. M. Carmichael and B. M. Haggard) who were desirous of visiting St. Petersburg *via* Archangel, a route which at least had the advantage of novelty to recommend it, and would enable them to boast of having rounded the North Cape of Europe, as well as having sailed through the little frequented White Sea, whose coasts are at present a *terra incognita* to tourists.

Two days after leaving Sunderland a melancholy instance of the uncertainty of life occurred on board the Montezuma, for the boatswain of the ship, being observed to be in a fit on the fore-yard, was found to be quite dead on being lowered on deck. A minute previously the poor fellow ascended the rigging, apparently in robust health. The same evening the body was committed to the deep with every mark of respect, all on board being present at the reading of the burial service.

Unusually thick weather prevailed during the passage to Hammerfest, and only one satisfactory observation for latitude was obtained, so that the ship's position was not so exactly known as was desirable. Care was however taken to keep a good offing whilst passing the Lofoten Islands, near to the south end of which lies the celebrated maelström, a fearful vortex, which, when increased by a westerly gale, is said to roar with a noise equal to the loudest cataract; in fine weather a short interval of quiet occurs at the change of tide.

These islands are resorted to during the summer months by fleets of fishing-vessels, for the purpose of taking cod, which are found in innumerable quantities in the vicinity. The fish are dried, and from the livers the oil now so universally in use is extracted.

The coast of Norway presents the appearance of a stupendous chain of mountains, with rugged peaks, abrupt promontories, and indented by deep narrow fiords. From abreast the south end of the Lofoten Islands the coast trends to the N.E. as far as the North Cape, in

latitude 71° 10' north, longitude 25° 46' east of Greenwich. The mainland is protected by the long range of the Lofoten Islands, which not only form admirable natural defences against the wild surges of the Arctic or Polar Sea, but are eminently useful in a commercial point of view by securing an inland navigation, which continues with but little interruption from the North Cape to the Naze, or South Cape of Norway.

On the arrival of the ships at Hammerfest, on July 12th, the English consul could give no additional information respecting the shipwrecked crews, as no vessel had yet arrived from the White Sea; but the Norwegian steamer Lindesnæs had passed through a day or two previously on her way thither, for the purpose of rendering assistance to Norwegian or Swedish crews.

The town of Hammerfest, the most northern in Europe, is built on the mountainous and barren island of Kvalø or Whale Island, and stands on the shores of a small bay, about half a mile in extent, with deep water close to the shore. The houses are all built of wood, many of the better sort having stone foundations; most of the warehouses stand on piles, and contain a goodly show of merchandise. During the summer months the bay is frequented by English, Russian, Dutch, Danish, and German vessels; the principal commerce is, however, carried on by small craft from the White Sea, whence the actual necessities of life are principally imported. There is also a considerable trade with Spitzbergen in small vessels, which would be deemed unsafe for English coasters; but they generally make their enterprising voyage productive by bringing back the skins of reindeer, walrus, white bears, and the down of the eider duck.

The population may be estimated at about 1,200, the chief articles of diet being milk and fish. The cattle, *i.e.*, oxen and reindeer, are housed in the winter, and when fodder fails are fed on fish, which are caught in great abundance, and form the principal export from Hammerfest to Archangel and other parts in the White Sea, whence flour and meal are brought in exchange.

The pilot who boarded the Montezuma at Hasvig (Sorøe Island) observed that a man who had resided in the village upwards of fifty years had no recollection of anything approaching the severity of the spring and summer. Snow had fallen almost continuously night and day since the middle of April to within three days of our arrival; indeed, the whole country was thickly covered with snow to the water's edge, although its disappearance is generally looked for towards the end of June.

The vice-consul confirmed the above statement, and remarked that, about three weeks before, the pack-ice approached within twenty-five miles of the coast, a circumstance unprecedented during his residence of forty years in the country.

The church, a red-tiled, commodious wooden building on the south side of the bay, was in a state of good repair. The interior was whitewashed, and fitted with benches instead of pews; over the eastern door was the organ gallery, the organ being painted white and tastefully picked out with gold. On the altar, which was covered with a linen cloth, were four massive candlesticks, and immediately above, a small but carefully-executed copy of Leonardo da Vinci's Last Supper; over it was a larger painting of inferior merit, representing the crucifixion, with the two Marys in attitudes of sorrowing adoration.

Adjoining the church was a capacious school-house for children of both sexes; but though most of the scholars were absent, the place was heated to an un-

pleasant degree. The presence of a harmonium implied that music was encouraged; a gymnasium, that athletic sports were not forgotten; whilst several maps and black boards which adorned the walls were suggestive of geography and mathematics.

A considerable quantity of oil is extracted from the livers of fish, which appear to be used indiscriminately; cod, haddock, and sharks all tend to augment the quantity, and revenge themselves by creating during the process a compound of the vilest smells it is possible to imagine.

As Captain McDougall was anxious to push on, the ships left Hammerfest during the afternoon of the day of their arrival, and, proceeding through Rolfsö Sound, rounded the North Cape at midnight, the sun at the same time being several degrees above the horizon. The following day, July 13th, the expedition closed the island of Vardö, off the northern entrance of Varanger fiord.

On landing at Vardö Island, the officers of the expedition communicated with the English consular agent, and afterwards went to the Fort to call on the governor—Captain Apenes, of the Norwegian army—who received them most kindly, and very sincerely expressed his regret that the urgent nature of the service on which the ships were employed prevented the officers making a longer stay.

The Fort, of small dimensions, star-shaped, and surrounded by a fosse, mounted twelve 24-pounder guns, ancient in date and appearance, with carriages to match; but there were in addition six 8-inch shell guns, all in a serviceable condition.

The garrison consisted of the captain, a lieutenant, and thirty non-commissioned officers and soldiers; but it was evident that the so-called fortress, of the time of Christian III, was retained more for ornament than use. The doctor, a civilian, who also did duty with the troops, had resided seven years in the island, and complained much of the monotony of such isolated existence; for four months included spring, summer, and autumn.

The governor, with pardonable pride, showed his English visitors the oven for red-hot shot; but the rickety brick affair was in keeping with all around, and would have required considerable repairs to render it capable of warming a potato.

The resident population amounts to about a thousand; but during the short summer this number is considerably augmented by fishermen from various parts of the coast, and the crews of numerous small craft, which carry on a considerable trade—for all the necessities of life are of course imported, payment being made partly in kind. Off the island were anchored ten or twelve brigs and schooners, besides smaller craft; and there was an evident appearance of prosperity attending this remote settlement; but an offensively oleaginous and fishy smell could be detected miles off the island, and was just the reverse of the "spicy breezes of Ceylon's Isle."

A profitable fishery exists off Vardö Island, producing cod, haddock, and halibut. The fish themselves are either salted or dried, and from the livers of all, including sharks, the oil is extracted, which always commands a marketable value.

After a short detention of two hours, the officers returned on board, and the ships proceeded on their way, the evening being beautifully fine and clear, with a nearer approach to summer temperature than had been experienced since leaving England. Around the ships both air and sea were full of life. Numerous whales rose on every side, throwing vast volumes of water into the air, as they lazily rolled their huge bodies along the

mirror-like surface of the sea, whilst the noisy gull, screaming tern, and hoarse puffin, revelled in the midst of their happy hunting-grounds.

Early on the morning of the 15th July, when about seven miles off Cape Gorodetski, the temperature of the air fell to thirty-two degrees; and soon afterwards the ships fell in with a stream of loose ice about four miles in length, whilst far away to the eastward an extensive mass of a more compact character was plainly discernible. This latter was probably the main pack, and all on board were prepared to encounter more; but it was soon lost sight of, and a clear and tranquil sea experienced the whole way to Archangel bar, off which the ships arrived on the morning of the 16th July.

When about to anchor, the *Montezuma* was boarded by a pilot, who looked somewhat blank on finding that the draught of water was too great to cross the bar. In answer to inquiries, he stated that six hundred shipwrecked seamen of all nations were in Archangel; but it was afterwards found that half that number would have been a closer approximation to truth.

There being no steamers available, Captain McDougall determined on proceeding to Archangel by boat; and at noon the ship's life-boat, somewhat overcrowded, started with the young flood up the river Dvina, the distance to the city being thirty-five miles. A fresh northerly breeze caused an unpleasant tumble, not only on the bar, but for some twelve miles beyond; and, as the buoyancy of the water lessened after entering the river, it was necessary to keep a press of sail on the boat, and a man constantly bailing. Under these circumstances the officers were not a little glad, after a disagreeable passage of five hours, to land at Solambalski, the port of Archangel, where some three hundred vessels were moored in tiers along the wharves.

After a brief interview with the chief of the Customs, (which was not very profitable, as he had not the most remote idea of speaking English, and Captain McDougall was about as far advanced in Russian), droskies were hired; and the party drove in procession to the English consul's house, at Archangel, a distance of three miles, which was accomplished in a cloud of dust and with an awful amount of jostling, for the Macadam of Archangel must have taken the paving of English dockyards as his type of perfection.

Here the officers were most hospitably received, and found themselves located in probably one of the finest mansions in the city. The Consul, Mr. Charles Renny, immediately telegraphed the arrival of the expedition to the Foreign Office in London (whence answers are sometimes received within twenty-four hours), and officially communicated the main facts attending the destruction of so many vessels.

Mr. Renny was himself an eye-witness of the loss of many ships, having been a passenger on board the steamer *Verona* of Leith, which vessel narrowly escaped destruction in the vicinity of Cape Orlov, where, on the 16th June, she was first beset in company with a fleet of 250 ships. Thence she was carried in the pack (in many places twenty feet thick where a pressure had taken place) to abreast of Poulonga, when, by means of her steam, on the 21st June she was enabled to force her way through the ice into clear water, and crossed the bar of the Dvina on the following day.

The greatest number of casualties occurred on the 18th and 19th of June, when the main body of the fleet, numbering about 250 sail, were all beset close together, some distance north of Sosnovet's Island, and within half a mile of the Lapland shore. To add to their perilous position, a strong north-easterly gale had

been blowing on the 17th and 18th of the month, driving the main body of ice on the Lapland coast, and closing every space of water; whilst the great velocity and uncertain set of the spring tides—especially on the flood—created inextricable confusion, by causing ships and ice to wheel in all directions.

The scene on the above days was described by all the masters of the wrecked ships as being truly awful; for the helpless vessels were entirely at the mercy of the ice, their stout sides being crushed in as if they had been matchboxes. In other cases the pack literally overran ships, and after making a clean sweep of bulwarks and masts, literally buried the hull in its onward and irresistible progress. In one vessel the water tanks from the lower hold were forced through the decks by the upward pressure of the pack; and in another, the ice, having passed through both sides, sustained the upper deck and enabled the crew to seek refuge on the ice: in this latter vessel was the master's wife and two young children, aged respectively three years, and seven months.

The crews of the vessels first wrecked sought shelter on board their nearest neighbours, to be again and again evicted by the terrible pack. Thus this way many of the crews could boast of having been wrecked three or four times in one day. There is necessarily a little uncertainty respecting the exact number of vessels lost, but the following statement is believed to be near the truth.

No. of Ships abandoned	64
„ recovered	14
„ lost	50

Of the last-named eighteen were English vessels, the remainder principally Norwegian. The masters of the English vessels pride themselves on the fact that only one vessel flying the British flag was recovered after being abandoned; indeed, many of them sunk almost under the feet of the crews, and not until the safety of the men rendered it imperative, were they abandoned to their fate.

Thirteen foreign vessels were recovered and taken into Archangel, twelve being navigated by English crews,* some of whom, having lost their own ships, took possession of the foreign derelicts as prizes, and obtained considerable amounts as salvage.

The whole of the English masters are unanimously of opinion that the season of 1867 was an exceptional one respecting ice and wind, the former being more compact than usual, whilst the latter was almost continuous from the N.E., thus closing the water channel generally found along the Lapland shore.

The thickness of the actual floes was from four to six feet, but in many places packed to the extent of thirty feet. There appeared no doubt of its being White Sea ice, its presence in such unusually large masses being attributable to the severity of the season, and the prevailing north-easterly winds.

During the stay of the officers in Archangel they were greatly indebted to the English Consul and Mrs. Renny, who succeeded in making their short visit a most pleasurable one, and all are desirous of acknowledging the kind courtesy they received from their hospitable host and his accomplished wife.

The number of shipwrecked persons—including the wife of one of the masters of the wrecked ships, and her two children—amounted to 131, and these having been

safely embarked, and clothes supplied to those in need, the Montezuma left Archangel Bar on the 19th July, and after a prosperous passage of ten days arrived at Dundee, where 107 of her passengers were landed, the remainder being brought on to the Thames.

CURIOSITIES OF PADDINGTON.

II.

LYSONS talks of “the village of Paddington,” and others of “the pretty little rural village of Paddington;” both descriptions very inapplicable to its present state. We have glanced at the district in Saxon and Norman times, and when it formed a portion of Tybourn manor, and next of the parish. But when Paddington became a separate parish, to it were annexed Westbourn; the manor of Notting Barns (Notting Hill), all that Chelsea now claims north of the Great Western road; as well as the manor of Paddington, and a considerable portion of that which now belongs to Marylebone. The old Roman road we see in Roque's maps, in a straight line from Tybourn Lane (Park Lane), along the high ground, to the top of Maida Hill; and this is thought to have been used until, in the reign of Edward VI, Sir Rowland Hill, Lord Mayor, made the highway to Kilburn. In Roque's maps we see three roads branching off northwards, from the Tybourn Road (now Oxford Street); one opposite North Audley Street; another opposite Tybourn Lane (now Park Lane); and the third, the present Edgware Road. On the triangular or gore-shaped piece of land, westward, between the ancient road and the present Edgware Road, on the highest point of ground on this part of the Tybourn Road, the gallows was erected, when it was removed from the Elmes: where William Fitzosbert, or Longbeard, was executed so early as 1196, as we learn from Roger de Wendover. “At the present time,” says Mr. Robins, “enough of Elmes Lane remains at Bayswater, to point out where the fatal elm grew and the gentle Tibourn ran; Elmes Lane is the first opening on the right hand, in the Uxbridge Road, opposite the head of the Serpentine; the Serpentine itself being formed in the bed of the ancient stream, first Tybourn, then Westbourn, the Ranelagh sewer.” Now, in the lease of the house, No. 49, Connaught Square (granted by the Bishop of London), the gallows is stated to have stood upon that spot. And, in 1811, a cartload of human bones, with parts of wearing apparel attached thereto, was excavated for the houses between Nos. 6 and 12, Connaught Place. Smith (*Hist. St. Marylebone*) states that the gallows was for many years a standing fixture, on a small eminence at the corner of the Edgware Road, near Tyburn Turnpike; beneath, the bones of Ireton, Bradshaw, and other regicides, are stated to have been buried. And in 1860, at the extreme south-west angle of the Edgware Road, were found numerous human bones, doubtless those of persons buried under the gallows. The early “Tyburn tree” was a triangle upon three legs: it was so described in the sixteenth and seventeenth centuries; and we see it so figured in the scarce etching of the penance of Queen Henrietta Maria beneath the gallows; though the incident is disbelieved, the form of the gallows may be correct. Subsequently, the gibbet consisted of two uprights and a cross-beam, erected on the morning of execution across the roadway, opposite the house at the corner of Upper Bryanstone Street, in the Edgware Road. The place of execution was changed in 1783. Two years after, Capon, the scene-painter, made a sketch of the Tyburn gallows; and in 1818 he wrote,

* The following is a list of British vessels lost:—Perseverance, Matanzas, Juno, Effort, Earl of Fife, and Eident, of Aberdeen; Crane, of Arbroath; Venus and Scotia, of Montrose; Brothers, of London; Ken, of Hartlepool; Charity, of Douglas; Trident, of Dundee; Chieftain and Onward, of Banff; Llewellyn, of Whitby; Santiago, of Middleboro'; and Conqueror, of Sunderland.

"The eastern end of Connaught Place is built on a plot of ground, then (1785) occupied by a cow-lair and dust and cinder heaps." The gallows was sold to a carpenter, who made it into stands for beer-butts, at the Carpenters' Arms public-house, hard by! Formerly, when a person prosecuted for any offence, and the prisoner was executed at Tyburn, the prosecutor was presented with "a Tyburn ticket," which exempted him from serving on juries, etc.; but this privilege has been repealed. Among the records of the Tyburn executions is that in 1705, of a burglar, who, having hung above a quarter of an hour, a reprieve arrived, when he was cut down, and, "being let blood, came to himself," as stated by Hatton, a careful authority. In 1760, Earl Ferrers was executed here for the murder of his steward: he rode from the Tower, wearing his wedding-clothes, in a landau drawn by six horses; he was indulged with a silken rope, and "the drop" was first used instead of the cart. The executioners fought for the rope, and the mob tore the black cloth from the scaffold as relics. The landau was subsequently kept in a coach-house at Acton until it fell to pieces, and the bill for the silken rope has been preserved.

Leaving these criminal notorieties, we may note that, in 1729, Tyburn Gate stood at the junction of the old Roman roads, that is, at the end of Park Lane, before it was removed westward. Paddington, according to Mr. Robins, "claims a considerable strip of Kensington Gardens, and is bounded west and north-west by an imaginary and irregular line, known only to the authorities and a few parish-boys, which runs over and through houses, greenhouses, etc., from the centre of the road opposite Palace Gardens to Kilburn Gate."

At the beginning of the last century, nearly the whole of Paddington had become grazing land; the occupiers of the Bishop's Estate kept here hundreds of cows. About 1790 were built nearly 100 small wooden cottages, tenanted by a colony of 600 journeymen artificers, whose dwellings gave way to Connaught Terrace.

At No. 7, in Connaught Place, facing Hyde Park, Caroline, Princess of Wales, was living in 1814. Hither the Princess Charlotte hurried in a hackney-coach, when she quarrelled with her father and left Warwick House, as vividly described by Lord Brougham in the "Edinburgh Review." Curiously enough, Camelford House, east of Park Lane, was some time inhabited by the Princess Charlotte and her husband, Prince Leopold.

Paddington maintained its rurality almost to our time. The Bayswater Road was noted for its tea-gardens, most of which were the "Physic Garden" of Sir John Hill, who prepared here, as he said, from plants, his tinctures, essences, etc., one of the latest being his "balsam of honey." The site of these gardens is now covered by noble houses. Of the old conduit at Bayswater, a memorial is preserved in Conduit Street and Spring Street, in the district known as Tyburnia, a town of palatial houses which has sprung up within thirty years. The Edgware and Harrow Roads were long noted for their old inns. In the former, the White Lion dated from 1524, the year when hops were first imported. At the Red Lion, tradition says, Shakspeare acted; and the Wheat-sheaf, upon like authority, was the favourite resort of Ben Jonson. Nursery-gardens extended the trim rurality to Kilburn; but they have disappeared with "the wells," before the gigantic march of bricks and mortar. The water is very fine at Bayswater, and many wells were not more than ten or fifteen feet deep.

Paddington possessed a chapel before the district was assigned to the monks of Westminster, in 1222. Where

this edifice was situated is doubtful, though it is said to have been near the present Marylebone Court House, *i.e.* beside the modern Tybourn; but the only evidence is some bones being dug up here in 1729. This church was built by and belonged to the De Veres; the excuse given for taking it down was, that it stood in a lonely place near the highway, and that it was, in consequence of its position, subject to the depredations of robbers, who frequently stole the images, bells, and ornaments. Now, as Mr. Robins states, the most lonely place "near the highway" was beside the ancient Tybourn, where the gibbet was formed out of the adjacent elm, and near this spot, he imagines, the ancient Tybourn church stood. The old ruinous church, pulled down about 1678, is thought, from its painted window, to have been dedicated to St. Katherine. St. James's Church was built by the Sheldons: here Hogarth was married to Sir James Thornhill's daughter, in 1729. This church was taken down, and St. Mary's built upon the Green, 1788—1791, "finely embosomed in venerable elms;" hard by were the village stocks, and in the churchyard a yew-tree, and a double-leaved elder. The church is, in plan, a square, has a roof with a cupola and vane, and a Tuscan and Doric portico. Under the chancel are deposited the remains of the second Marquess of Lansdowne, who died in 1809; in 1853 there was not a word to mark his resting-place. Here also are interred Bushnell, the sculptor of the figures on Temple Bar; Barrett, the landscape-painter; Banks, the sculptor; Vivares and Schiavonetti, engravers, in the churchyard. The oldest tombstone here is that of John Hubbard, who died in 1665, "aged 111 years." Bryan, author of "The Dictionary of Painters and Engravers," and Nollekens, the painter, and father of the sculptor, also lie here. In the new burial ground lies Mrs. Siddons, and near her grave lies Haydon, the historical painter; also, William Collins, R.A., distinguished for his sea-shore scenes, whose grave is marked by a marble cross. In the church are tablets to Nollekens, the sculptor; Mrs. Siddons; and Richard Twiss, author of the "Verbal Index to Shakspeare." Here, too, lies Caleb Whitefoord, the eccentric newspaper writer, whom Goldsmith has enshrined in the amber of his verse:—

"Here Whitefoord reclines, and deny it who can,
Though he merrily liv'd, he is now a grave man!"

* * * * *

Ye newspaper wittlings, yet pert scribbling folks!

Who copied his squibs and re-echoed his jokes;

Ye tame imitators, ye servile herd, come,

Still follow your master, and visit his tomb:

To deck it bring with you festoons of the vine,

And copious libations bestow on his shrine;

Then strew all around it (you can do no less)

Cross-readings, Ship News, and Mistakes of the Press."

Goldsmith's "Retaliation."

Down to 1818, St. Mary's was the only church in Paddington. Then, Mr. Orme, the well-known print-seller, built a chapel to hold 1,200 persons. Next was built Connaught Chapel, now St. John's, a debased imitation of New College Chapel, with a costly stained glass window of the Twelve Apostles. St. James's was next built, and in 1845 became the parish church. In 1844—46 was added Holy Trinity, a Perpendicular church, by Cundy: its richly crocket spire and pinnacled tower are 219 feet high, and it has a magnificent stained window. The crypt is level with the roofs of the houses in Belgrave Square. This church cost £18,458, towards which the Rev. Mr. Miles gave £4,000. Mr. Cundy, the architect, presented a carved stone altar-piece; but the question of stone or wood being then rife, wood carried it, and the parish paid £38 for a carved oak altar-table and two chairs. All Saint's, in Cambridge Place,

occupies part of the old reservoir of the Grand Junction Waterworks Company. Although it is said that the erection of dissenters' places of worship was long restricted in Paddington, by the Bishops of London, part of the Paddington estate was leased without any such restriction. On a portion of the land bequeathed by the Lady Margaret to the poor is built a large Roman Catholic church.

In St. George's Row is a chapel of ease to St. George's, Hanover Square, and a burial-ground, wherein, near the west wall, lies Lawrence Sterne, the author of "Tristram Shandy." He died at his lodgings in Old Bond Street; his grave has a plain head-stone, set up with a strange inscription by some tipling freemason, and restored by a shilling subscription in 1846. Here, too, lay Sir Thomas Picton, who fell at the Battle of Waterloo, in 1815; his remains were removed to St. Paul's Cathedral in 1859.

The oldest charitable buildings in Paddington are the Almshouses, which were built on the Green in 1714. Queen Charlotte's Lying-in Hospital was originally established in 1752 in St. George's Row, near Tyburn Turnpike. The great charitable institution of the district is St. Mary's Hospital, the first stone of which was laid by Prince Albert the Good, on Coronation-day, 1845. Mr. Robins, in 1853, named "the Flora Tea Gardens," and "Batt's Bowling-green," as public places; and he describes a region of the parish "still devoted to bull-dogs and pet spaniels; the bodies of broken-down carriages, old wheels, rusty grates, and old copper boilers; little gardens and low miserable sheds; and an establishment which boasts of having the truly attractive glass, in which, for the small charge of twopence, any lady may behold her future husband." Time and education, let us hope, have swept away such impostures and absurdities.

Tyburnia, described as a city of palaces, sprung up on the Bishop's Estate within twenty years. "A road of iron, with steeds of steam, brings into the centre of this city, and takes from it in one year, a greater number of living beings than could be found in all England a few years ago." The electric telegraph is at work by the side of this iron road; and it is now three-and-twenty years since a murderer was first taken by means of the electric wire: it was then laid from the Slough station to Paddington; the man left in a first-class carriage, and at the same instant was sent off, by the telegraph, a full description of his person, with instructions to cause him to be watched by the police upon his arrival at Paddington, where he was pointed out to a police sergeant, who got into the same omnibus with the suspected man, and he was captured in the City. Thus, while he was on his way, at a fast rate, the telegraph, with still greater rapidity, sent along the wire which skirted the path of the carriage in which he sat, the instructions for his capture! Had he got out between Slough and Paddington, and not at the latter, he would have escaped, as the telegraph did not work at the intermediate stations.

The omnibus was first started from Paddington (the "Yorkshire Stingo," New Road) to the Bank in 1829. By this vehicle "the whole of London can now be traversed in half the time it took to reach Holborn Bars at the beginning of the century, when the road was in the hands of Mr. Miles, his pair-horse coach, and his redoubtable boy," long the only appointed agents of communication between Paddington and the City, the journey occupying something more than three hours. Miles's boy told tales on the road, and played the fiddle to amuse the passengers. When the omnibuses were first started,

the aristocracy of Paddington Green petitioned the vestry to rid them of "the nuisance;" just as the Duke of Bedford, in 1756, opposed the New Road, on account of the dust it would make in the rear of Bedford House.

The people of Paddington, Mr. Robins tells us, although being at so short a distance from London, made no greater advances in civilisation for many centuries than did those who lived in the most remote village in England. The few people who lived here were agriculturists. The revocation of the Edict of Nantes drove many French Protestants here, as the grave-stones in the old churchyard testify. In 1524, the population of Paddington did not exceed 100; in Charles II's reign 300; in 1811 the population was 4609; from 1831 to 1841 it increased 1000 per annum; from 1841 to 1851, above 2000 annually; and in 1861 the population return was 75,807.

We find few old mansions in Paddington. Desborough House is believed to have belonged to the Colonel of the Commonwealth times, and related to Cromwell. According to Lysons, Little Shaftesbury House, in this parish (near Kensington Gravel Pits), was built by the Earl of Shaftesbury, author of the "Characteristics," or his grandfather, the Lord Chancellor.

Fifty years ago more than one-eighth of the whole population were paupers. Nearly the whole of the parish was grazing land, and the occupiers of the Bishop's Estate were celebrated for the quantity or quality of the milk of their cows: and one cowkeeper here had the conventional nine hundred and ninety-nine cows.

Less than seventy years ago, one of the grand projects in the district proved a pest to the people. In July 10, 1801, the Paddington Canal was opened with such *éclat*, that 20,000 persons came to Paddington (says Mr. Robins) to hurrah the mighty men who so altered the aspect of this quiet village, and who, in doing so, offered the Londoner a new mode of transit for his goods. Unfortunately for the people of Paddington, on the banks of this canal were stowed away, not only the dust and ashes, but the filth of half London, which were brought here for convenience of removal; and here their pestilential effects on the dwellers on the canal banks were frightful. "Instead," says Mr. Robins, "of having no doctor in the parish, as was the case within the memory of many now living in it, both doctor and sexton found full employ."

Strange have been the mutations through which, from a forest village, has risen the large town, and one of three parishes, forming the parliamentary borough of Marylebone.

WHO'S TO GO? OR, REDUCING THE STAFF IN A GOVERNMENT OFFICE.

ONE morning in January, 185—, a few minutes after the letters had been delivered to the registering clerk in the office of the Inspector-General, an attentive group of about a dozen clerks might have been seen gathered round one of their number who was reading aloud, for the benefit of the others, a letter from the Board of Circumlocution. The listeners were pale with consternation, for that letter created a crisis which would change the destiny of many amongst them, who, till that morning, had calculated on having good situations for life.

The fatal letter conveyed the intimation that it pleased my Lords of the Board of Circumlocution to reduce the staff of the Inspector-General's office from twenty

clerks to twelve, the order to take effect at the expiration of the financial year, 31st March ensuing. No names were mentioned, nor was there the slightest indication given who the particular persons might be whose services were to be dispensed with. Not a word about provision in other offices for the discharged clerks; not a syllable about compensation for loss of employment.

After the public reading of the letter each clerk quietly and gravely perused it for his own special consideration, carefully weighing the import of every sentence and every word.

Henceforth what changes were discernible in the "personnel" of the office! The quondam idler, whose beau idéal of official life had been a graceful lounge through his duties, combined with his daily share in discussing town gossip and the latest favourite for the Derby, was now active and diligent. No one was more punctual at office at ten o'clock, sharp. His desk, once covered with official papers, dusty with age and weeks in arrear, was now tidy and free from rubbish. Dockets were carefully sorted, tied up in neat packets duly labelled and numbered. "Sick notes," regretting inability to attend at the office, had become marvellously rare.

Days and weeks passed away, and still was the anxious question asked, "Who's to go?" without any certain response, till within three weeks of the time fixed by the Board for the reduction to take place.

"Mr. Jones, sir, Mr. Dangar wants to see you, sir," said Spooner, the obsequious messenger, putting his head into the room, where sat at his desk one of the senior clerks.

Mr. Dangar was a clever ambitious man, who owed his present position as chief clerk entirely to his own talent and ability. Considerably younger than many men in the office, he was very superior to them in mental acumen, and was a really brilliant fellow in dashing off lengthy and intricate reports, on all kinds of subjects, in a marvellously short space of time. He had often been seen to take a bunch of papers from a clerk, master their contents almost at a glance, and write off a by no means short report in a few minutes.

His memory was prodigious. After a moment's reflection he would point out the place where recorded, of a paper that had passed through the office twenty years before.

Like all ambitious men, he had little regard for the feelings of others; and, provided he could climb to the top of the ladder on the shoulders of his junior clerks, he cared not what became of them. He knew well the order of reduction had no reference to him, and that a reconstituted office meant a sure increase of salary for himself.

Each clerk, from Jones downward, was now called before the astute Dangar, who asked every one, singly, the odd and superfluous question whether he wished to leave the office. Leave a moderate competency, for what? To many there could be but one answer—beggary—for Dangar said nothing about re-employment.

There were two clerks named Savage—father and son—distinguished by their fellow-clerks as old Savage and young Savage. The elder Savage was a fierce Radical, and, on that account, the object of Mr. Dangar's special dislike. Upon one occasion old Savage wished to leave the office at a quarter before four o'clock, when the chief, who was standing over his washing-stand with his shirt-sleeves tucked up to his elbows, and was in the act of towelling his face, only sputtered out—

"Oh, of course a Radical can go. A Radical can go at any time."

With all his "radicalism," old Savage was a man of

warm feeling, and undeniably truthful and honest. With a flushed face he received Spooner's invitation to descend to the redoubtable Dangar, for he knew there was an intention to use the opportunity of lopping off at least one of the Savages.

Old Savage returned from his interview with Mr. Dangar in a fury. He had not only been told of the decree concerning himself, that he would be discharged on a pension of some £60 or £70 per annum—for he had only served twenty years—but Mr. Dangar had attempted to throw dust in the old man's eyes by telling him that it was extremely inconvenient to have two men of the same name in the office. Papers that should have been for the elder Savage's reports were allowed to fall into arrears on the younger Savage's desk, and *vice versa*.

At any other time such a saying would have been received with ridicule; but now it was felt to be insulting. An explosion of "Radical" wrath was the consequence. If Dangar meant fighting in that way, he would fight him with every weapon within reach. Let Dangar look to himself. He (Savage) had friends in Parliament who would take up his case.

The Savages, though low down in the office-list, were not to be despised on that account. They were natives of Roscorn, the model borough, where no Whig or Tory burgess was ever known to take a bribe. It was said the Savages could command thirty votes, by virtue of their house property in Roscorn; and it may be mentioned, to show the power of Parliamentary influence, that the elder Savage managed to get re-appointed to the Inspector-General's office as an extra clerk, at the same salary he had received at the date of his discharge; and within twelve months, and immediately after the return of the Whigs to power, he was restored to his original place in the establishment, with all the privileges and emoluments attaching thereto.

Of the clerks who were pensioned, the case of one was particularly hard. He was thirty years of age, had been thirteen years in the office, and was now sent adrift in the world on the magnificent pension of £33 per annum. Had his friends not helped him he must have starved; as it was, he was reduced to the position of a beggar.

The junior clerks who had not completed ten years' service were discharged with the gratuity of a month's pay. One of these, young Birmingham, who, two years previously, had entered the service through the portals of the Civil Service Commission, and though in the distant position of a junior clerk, conceived the presumptuous idea of sending up his card to the Inspector-General. An interview was barely accorded, for cold in the extreme was the reception of subordinate clerks by such Olympian magnificence.

Birmingham ventured to ask the Inspector-General if he would move the Board of Circumlocution to give him another appointment, mentioning some vacancies then existing in other offices. A storm of wrath ensued, and the unhappy Birmingham was only too glad to make his exit as quickly as possible from the presence of a man who roared at him, as he was leaving, that "he would have no bargaining with the public service."

There was a bright side to this dismal picture: the clerks who survived this convulsion receiving promotion and higher salaries, the office having been reconstituted on a better scale of pay.

Having thus recalled a little revolution or crisis of which I was a personal witness, I may add a few words about Government clerks generally.

In the middle classes, before examination tests became

the fashion, if a father had interest with the county or borough member, on the right side of the question, to secure a nomination for his son to a public office, nothing was easier than to take the appointment up. This was the way in the good old times, before the Civil Service Commission blocked the way to all dullards and ignoramuses. It is not intended here to regard the doings of the Civil Service Commissioners as faultless. Many good men are rejected for some trifling error, caused more by nervousness and over-anxiety to succeed than from ignorance. An instance may be mentioned where a candidate for the appointment of surveyor of taxes passed in every other subject except handwriting; and yet the candidate wrote a very good hand, and had filled the position of cashier in a respectable country bank for a year or two. His friends were greatly disappointed. They borrowed the bank books, took them to London, and laid them before the Civil Service Commissioners. There was no redress, and no court of appeal. The only reply vouchsafed was that the Commissioners could not reverse their decision. On the other hand, there cannot be a doubt the Commission does good service in keeping out men who can neither write nor spell the Queen's English. Butlers and footmen, the sons of petty shopkeepers in rotten boroughs, broken-down carpenters and book-binders, and half-educated Irish peasants, have very little chance henceforth of obtaining appointments for which they are wholly unsuited. A good story used to be told that, about twenty years ago, a butler was appointed to the Customs, who reported to the Treasury that, the nominee having served the usual six months' probation, was found inefficient, being unable to copy a letter correctly. The response from the Treasury was said to be that the Board of Customs must make him efficient, as the Treasury had no power to cancel the appointment.

There is a popular impression that an appointment to a Government office is for life, or during good behaviour, and that, when a youth has once entered the service of the State, he may bid adieu to all anxiety regarding the future. Let him only attend punctually at office from ten to four, and condescend to draw his salary four times a year, he may rest certain of a life comparatively free from care and responsibility, may make sure of an ample supply of newspapers and gossip to vary the dull monotony of official routine, and, when his limbs refuse any longer to carry him to office, may look forward to a fat pension for his declining years.

No doubt there are some grounds for opinions of this sort regarding some clerkships in the Civil Service, but there is no certainty whatever that the best clerk under the Crown, however efficient and well-behaved, will be permanently employed. It depends also on Parliament whether, if pensioned off on reduction of office, he will receive one farthing of compensation.

The Civil Service Superannuation Act certainly empowers the Treasury to grant compensation to clerks discharged on reduction of office; but cruel are the tender mercies of the authorities when the services of junior clerks are no longer required. At the shortest notice, an office may be reduced and half the clerks discharged, after spending from ten to twenty of the best years of their lives in the public service.* There is no half-pay for a discharged clerk, and as to re-employment, it is hopeless, although there may be numerous vacancies in other offices where he would be only too thankful to get employment, even at the foot of the official ladder.

* We have allowed our contributor to have his grumble; but most readers will see that clerks in private as well as public establishments are exposed to similar hardship and uncertainty.

Varieties.

TIPPLING HABITS IN LADIES.—The "Lancet" has raised its voice, certainly none too soon, against the increasing indulgence, among the educated and gentle, of what it justly characterises as the pernicious habit of tippling. There can be no doubt in the mind of any who observe the changes of manners in good society that this very serious charge is well founded, nor must the ladies, though the "Lancet" delicately abstains from direct allusion to them, be allowed to consider themselves exempted from its strictures. But has the faculty, as it is called, nothing to answer for in promoting the present state of things? Children are now given, "by the doctor's orders," an amount of alcohol which would have horrified their grandmothers. The beer and port wine administered two or three times a day at first disgusts but soon becomes grateful to them. Almost every one of us may plead medical advice as the beginning of the habit. They say the modern type of disease is low; that stimulants are requisite; and that, whether they prescribe chloric ether or champagne does not much signify. Perhaps not in the physical point of view, but in the moral one. Surely, the temptation to the abuse of such stimulants as lavender or ether is not so great or so constantly recurring as that of wine and liqueurs, which are offered and pressed upon us wherever we go. Brandy now takes the place of sal volatile in the lady's dressing-case; and the properties of gin as a cleansing agent applicable to everything, from the gilt stopper of a scent-bottle to a lace flounce, are firmly impressed on the mind of the waiting-maid. We would never speak but with respect of the noble profession of healing; but it cannot be denied that the peculiar temptation assailing some of its more "fashionable" members is that of following rather than leading the inclinations of their patients.—*Pall Mall Gazette.*

COINAGE OF 1866.—In the year 1866, 4,047,288 sovereigns were coined at the Mint, and 2,058,776 half-sovereigns, 914,760 florins, 4,989,600 shillings, 5,140,080 sixpences, 4158 fourpences, 1,905,288 threepences, 4752 silver twopences, 7920 silver pence; also 9,999,360 copper pence, 2,508,800 halfpence, and 3,584,000 farthings. Altogether, therefore, money was coined at the Mint in 1866 to the amount of £5,076,676 in gold, £493,416 in silver, and £50,624 in copper, or £5,620,716 in all. Worn silver coin of the nominal value of £115,000 was purchased from the Bank of England, for re-coining, and a loss of £15,648 was occasioned by its re-coining.

HONEST SALLY: A FAITHFUL DOMESTIC.—On the south wall of the chancel of Ibbstock Church, Leicestershire, a neat plain marble tablet thus records the worth of a faithful and pious domestic:—"Reader, respect the memory of Sarah Jackson; an invaluable servant; a sincere Christian; distinguished beyond wealth and titles by the dignity of worth. Let her remind you that an humble station may exercise the highest virtue, and that a well-earned pittance of earthly wages may prove the richest treasure in heaven. She lived, during twenty-seven years, in the family of the Rev. Spencer Madan, by whom this marble is affectionately inscribed, in token of Regret, Esteem, and Gratitude."

"A servant, no, an unassuming friend,
Sinks to the tomb in Sally's mournful end.
Peace, Honest Sally, to a soul that knew
No deed unfaithful—not a word untrue!
Thrice happy they, whose mortal labours done
May lead like thine from service to a throne!
Go, claim the promise of thy chosen part,
In zeal a Martha, with a Mary's heart!"

Ibbstock parish had once the dubious benefit of having the celebrated William Laud as its rector. He was inducted in 1617, and resigned in 1625. Shortly after, he was made Bishop of Bath and Wells; in the same year Dean of the Chapel Royal; the Bishop of London in 1628; Chancellor of the University of Oxford 1631; Archbishop of Canterbury in 1633. He was beheaded on Tower Hill on January 10, 1644.—*Nichol's Leicestershire.*

THE OLDEST ILLUSTRATED NEWSPAPER.—The "Mercurius Civicus," or "London's Intelligencer," printed and sold in the Old Bailey in 1643, is not only remarkable as containing probably the earliest instances of newspaper advertisements, but as being the earliest illustrated newspaper, each number containing a woodcut portrait of the heroes of the day, when the Civil Wars were going on throughout the kingdom, in the troublous times of King Charles I.

THE LEISURE HOUR

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUTH KNOWLEDGE HAND IN HAND."—*Copper.*

THE CAPTAIN OF THE SPANISH PIRATE SHIP.

THE MORTONS OF MORTON HALL.

CHAPTER XIX.—THE LAST "SATURDAY NIGHT AT SEA."

WHEN the moon rose, and Captain Dobson and his officers were satisfied that the Amazon lay at the mercy of pirates, the female passengers were forthwith made acquainted with the dreadful peril that threatened them. Although some among them fainted and others cried and screamed, and tore their hair in a paroxysm of terror, there were two or three who behaved with the noble courage and firmness so frequently seen among women in the presence of danger, especially in the face

of perils against which effort is vain and resistance useless—when, in fact, the more active heroism of the sterner sex is of no avail.

These latter sought to comfort and support their terrified companions; though it was not easy to calm the fears of others, while their own hearts were sinking with fear. Still they struggled to maintain an outward semblance of hope and courage, and urged the more nervous to take such measures as they could for their own safety, knowing that action itself was some relief at such times of trial.

By the advice of the captain the ladies retired to the

state-rooms and shut themselves in; and there, clinging together for mutual support, they silently supplicated Heaven to protect them and all on board from harm, and to avert the perils that threatened them.

When, therefore, Captain Dobson and the commander of the pirate schooner descended to the cabin, they found it untenanted, save by the steward and his sable subordinates, whose ebony faces had changed to a greyish hue with terror.

The Spanish captain ordered Captain Dobson to produce instantly all the money or specie on board his vessel, whether belonging to himself or his owners, and threatened him with instant death if he refused or hesitated; but perceiving that the captain was ignorant, or pretended to be ignorant, of the Spanish language, he called to the American sailor, whose name was Joel, to descend to the cabin and act as interpreter.

The old seaman repeated the words of his captain, and added some advice of his own.

"And yer'd best dew it tew, right deoun smart, ef yer wantter save yer skin, cap'en. These yere critturs arn't tew be trifled with, I kin tell ye—though," he added in a lower voice, "I'm not one on 'em, by ch'ice. I'm yere jist becase if I hadn't jined 'em, I should ha' made a hole in the water, es many o' my poor shipmets did."

While the American sailor was speaking, Captain Dobson had brought his writing-desk from his state-room, and taken from it a weighty bag of gold and a roll of bank-notes, the joint property of the owners of the Amazon and himself; but, fancying that his countryman wished to befriend him so far as it lay in his power, he said to the old sailor—

"Joel—if that be your name—I've eight female passengers on board. I'll gladly give up all the money I have, and the passengers shall do the same, if by so doing I can save the ladies from violence or insult, and preserve the vessel and the lives of the crew and passengers."

The old sailor gave a long whistle under his breath, and without looking towards his commander, or even at Captain Dobson, but pretending to admire the gold with which the cabin table was strewn, he muttered—

"That's ork'ard—that is. 'Tell ye what, cap'en. Thar's on'y won way tew streak out o' this yere mess. Yer must just git Cap'en Manual tew gi' ye his word of honour 'es he'll not disturb nowt on board, nor dew yer no parsonal harm whatsomever, purwiden' yer gin up everything he wants to carry away. He'll stick tew what he promises right slick up and deown straight. It's reel moosical to think heow these chaps sticks tew thar word o' honour, while they're plunderin' yer right afore yer eyes."

"What says he? What are you prating about?" cried the pirate chief, sternly, in Spanish.

The sailor replied in the same language, that the American captain would surrender his gold, and all else on board, if the Señor Capitano would promise to save the lives of the crew and passengers, and protect them from the insult or violence of his own people.

"I have already given my word," replied the Spaniard. "If he fulfil his conditions, so will I fulfil mine."

Joel translated this to Captain Dobson.

"Then tell him," said the captain, "that there are ladies on board, whom I especially wish to preserve from insult."

The pirate chief smiled, as if to say that he saw through Captain Dobson's artifice; but the smile passed away, and, bowing low and placing his hand upon his heart, he replied, "The honour of a true Spaniard, Señor

Capitano, is sacred. Let me pay my respects to the ladies, and assure them myself that they shall suffer from neither insult nor wrong at the hands of my crew, and then let them retire and keep themselves quiet. Let them not be seen. You comprehend me, Señor Capitano?"

Sorely against their will the ladies were obliged to come forth from their state-rooms and receive assurance of protection from the pirate chief; though, when some of them, in their affright, were about to give up the various little articles of jewellery they wore, the gallant Spaniard signified, through his interpreter, that they were to retain them. He was too happy to present these trifles to them as a mark of his respect. They then again retired, and shut themselves in, while the pirate chief selected whatsoever he thought proper—which amounted, in fact, to every portable thing of value that the cabin contained—and ordered the spoil to be carried on deck.

The money, clothing, and other valuables belonging to the male passengers, the greater portion of the liquors, and stores of every description, from the "lazarette," and such packages of cargo as could be easily removed from the hold, were piled on deck, and, together with the specie and stores, were passed on board the schooner. Several of the smaller spare spars were selected from the booms. The lighter sails were unbent from aloft, and spare sails and coils of rope and cordage were pillaged from the sail-room, and likewise transferred to the schooner.

All this was done with practised and marvellous celerity; and when at length the pirates had possessed themselves of everything they saw fit to carry away, even to the clothing of the male passengers and sailors, and several of the cooking utensils from the cook's galley, the pirate chief politely bade the captain and passengers farewell, and called upon the former to bear testimony that he had conducted himself as a man of honour and a true Castilian. He then ordered his men to return to the schooner, and, addressing himself to the crew of the ship, through his interpreter, informed them that they were at liberty to proceed on their voyage. Shaking hands with Captain Dobson, he continued:—

"Señor Capitano, I wish you a safe and speedy arrival in port. Be happy that you are not far distant, and accept my profound admiration of the excellent order and fine appearance of your ship. Truly, I was at one time inclined to believe she was a ship of war. Had that been the case, I assure you I should not have ventured to pay my respects to you. No doubt you perceived me reconnoitring under the land? Addio, Señor Capitano, addio!" And with this final farewell he gracefully waved his hand, leaped on board his own vessel, ordered her sails to be hoisted aloft, and sheered away from alongside the plundered ship.

The beautiful schooner bounded swiftly over the smooth water, before the light breeze, and in less than half an hour disappeared from view, under the shadow of the land. So rapidly had her villainous crew performed their task, that when the schooner quitted the ship's side it was yet but one hour past midnight; and now, left to themselves, Captain Dobson and his passengers and crew seemed for the first time to realise their unhappy position.

It was sudden transition from the sense of comfort and security, and from the kindly feeling and innocent hilarity which had prevailed on board the Amazon on this, her last Saturday night at sea, to the vague feelings of doubt and terror which had seized upon all on board when the

alarm was first given. A half hour of cruel suspense had succeeded, and which was followed by the conviction that the ship was at the mercy of a crew of lawless desperadoes. The subsequent boarding of the vessel by the pirates, the scene of plunder that ensued, and the final departure of the schooner, had seemed more like a frightful dream than actual reality. Now, however, they had time to think over what had occurred; and some among the passengers, who had borne themselves bravely during the interval of peril, when the slightest movement, misinterpreted by the pirates, might have changed their plunder to bloodshed and massacre, now gave way to their long pent-up emotions. Some of the ladies, who had set an example of calmness and courage during a period of terrible suspense and dread that must have tried the firmest nerves, now fainted away when they thought of their escape from a fate the very idea of which was horrible to contemplate, and were only with great difficulty satisfied, when they recovered consciousness, that the pirates had departed and left them in safety. The male passengers, too, now found time to mourn over the serious, and, to some among them, the ruinous loss they had sustained; for the buccaneers had not only robbed them of all their portable property, in the shape of money and jewellery, but had robbed them also of all their clothing, with the exception of the garments they wore. Many of them now wickedly (and falsely) regretted that their lives had been spared, and vowed that they had rather have been massacred at once than plundered of all they possessed.

The captain and crew had as much reason to lament the loss of their property as had the passengers; but the former, at least for the time being, had duties to perform and other matters to think of. As has been told, the pirates had plundered the vessel of her lighter sails; even those which had hung from the yards had been cut away from the bolt-ropes and carried off. The lighter canvas and cordage had also been plundered from the sail-room, and no resource was left but to make top-gallant sails and royals from the stout canvas of the courses, and bend them to the yards as speedily as possible, since, in the frequent light breezes that prevail in the tropics, they depended greatly upon the lighter canvas for the prosecution of the remainder of the passage. While, therefore, some of the hands were instantly set to work to perform this indispensable duty, others were sent to examine the condition of the store-rooms and the "lazarette," and to discover whether the greedy marauders had left a sufficiency of provisions and stores on board to last the ship until she should arrive at New Orleans. All this while no one had given a thought to the pumps, until Captain Dobson, suddenly fancying that something was wrong, and that the vessel seemed to float heavily upon the water, called to the carpenter and bade him sound the well, and report the depth of water in the hold.

Presently the carpenter appeared on the quarter-deck, with a face that seemed ghost-like in its pallor beneath the bright moonlight.

"Speak, man. What is it?" cried the captain, startled by the carpenter's look of horror. "What is the depth of water? Have you lost your speech?"

"There are four feet water in the hold, sir!" the terrified man at length gasped forth.

"Four feet water!" exclaimed the captain, wildly. "Impossible! You must be mistaken."

"It is no mistake, sir," replied the carpenter. "I sounded the well twice. I thought I *must* have been mistaken. The water gained three inches between

soundings. The pirates must have scuttled the ship before they left her."

Giving utterance to an exclamation of horror, and with a face as pale as the carpenter's, the captain snatched the line and rod from the man's hands, and, springing to the pumps, sounded the well himself.

There was indeed no mistake. The water had gained during the carpenter's brief absence. There were now nearly five feet of water in the hold!

It would be impossible to describe the alarm and confusion that immediately took place on board the doomed vessel. From lip to lip flew the fearful tidings—

"Five feet water in the hold, and gaining rapidly!"

To set the men to the pump-breaks in such a state of affairs was an act of uselessness; nevertheless, the order was given,

"*All hands to pump ship!*"

With three men to each pump-break, relieved every two minutes from the arduous, desperate labour, for half an hour almost superhuman exertions were made to clear the hold of its fatal load. But all exertions for this purpose were in vain. For a few minutes it was thought that some slight advantage was gained; then the water poured in faster than ever, and the breaks were quitted in despair. The water had gained the mastery before the leaks were discovered; the anchor-holes bored into the ship's sides were beneath the water-line, and all attempts to stop them up were worse than useless. The only question now was how long the vessel would float. Her cargo was light and buoyant—that was one thing to her advantage; and the exertions of the captain, passengers, and crew—for at such a time all worked alike—were now directed solely to the saving of human life. All else was forgotten in the eager clinging to life; the loss of clothing, of property; the lack of provisions to sustain life, if saved—all else was regarded as nought in comparison. Very soon were they who, but a few minutes before, had blasphemously vowed that a frightful death were to them less terrible than the loss of wealth, compelled to give the lie to their vain assertions. These very men were the wildest in their despair when the death they had pretended to wish for stared them in the face.

Aboard the doomed ship there was not one—not the weakest, the poorest amongst them—who would not have cried, something in the style of Gonzola in the "Tempest:" "Now would I give a thousand furlongs of sea for an acre of barren ground—long heath, brown furze, anything. My last hour must come; but I would fain die a dry death!"

Many were the silent prayers that were sent up to heaven; many the bitter anathemas that were hurled at the brutal wretches who, not content with plunder, had, with a pretence of mercy, wantonly and uselessly consigned their fellow-mortals to a horrible, lingering death.

But though many prayed, and some idly and wickedly cursed, according to their nature and their mood, *all* worked. Even the women in the cabin worked now, and gathered together such articles as they thought would most be needed in the dreary cruise in open boats that lay before them; for the captain, amidst all his trials and troubles, spoke hopefully. He believed the vessel would float until daylight, and the boats were sufficient to carry all on board.

Thus ended the last Saturday night at sea on board the Amazon. Little had the captain thought when, but a few hours before, those words had escaped his lips, that he spoke of the last Saturday night on which the gallant ship that had borne him safely so many times

across the ocean would ever float, and that her timbers were doomed to rot, worm-eaten, beneath the waters of the Mexican Gulf.*

CHAPTER XX.—THE HURRICANE IN THE GULF OF MEXICO.
HENRY TALBOT AT ST. DOMINGO INSTEAD OF NEW ORLEANS.

GRADUALLY, though slowly, the doomed ship settled down upon the waters, beneath which she was so soon to be for ever entombed; yet she still floated when the dawn of the fair tropical morning appeared in all its glorious beauty.

Little admiration, however, had the crew and passengers of the ill-fated Amazon to bestow at this anxious moment upon the beauty of the day dawn. The vessel had drifted out of sight of the land during the darkness of the early morning hours, though its position was manifest from the mist which hung over it, and the breeze, which (as usual in the early morning in tropical latitudes) blew off the shore, was redolent with the perfume of fruits and flowers.

Captain Dobson issued his orders calmly and coolly, and by his example inspired the crew and passengers alike with hope and courage. The boats were all lowered alongside, and a certain number of persons apportioned to each boat, and these now descended the side, leaving only those who were to take their places in the pinnace with the captain, on deck.

The rapacious pirates had carried off almost everything in the shape of provisions that they could lay hands upon; and though there were several barrels of beef, pork, and flour—as cargo—in the ship's hold, these were now beneath the water; and even had it been otherwise, there was no time to break bulk, and hoist them on deck from their place of stowage. The quantity of provisions that they were able to collect would have barely sufficed to supply one day's full rations to every soul on board the ship; and though the captain hoped to make the land at some spot where food and assistance might be procured, in less than twenty-four hours, he was well aware that circumstances might arise which would compel the boats to keep at sea for days.

Of water, however, that greatest of necessities in a tropical climate, there was an abundance, and a sufficient number of beakers were filled from the tanks, and placed in each boat, while the scant provisions were fairly apportioned, according to the number of individuals each boat contained.

By the time all this was effected there were unmistakable signs that the ship could not remain afloat much longer. Those who still remained on board (amongst whom was the captain, who remained to the last) now sprung from the deck, and the boats put off, the rowers pulling as quickly as possible from the ship, in order to escape from the possibility of being drawn into the whirlpool she would create when she made the final plunge and sank to the bottom.

They had quitted the ship none too soon. Hardly had they pulled a furlong distant, ere she rolled lazily from side to side, and then made one desperate plunge—throwing her stern high out of the water—and sank

to rise no more. Even at the distance they had gained, they felt the "swirl," and it required all the efforts of the oarsmen to keep the boats from being drawn into it.

Notwithstanding their own distress, there was not an individual on board the boats who did not feel a pang of regret for the fate of the vessel that had borne them over so many thousands of miles of ocean in safety—a pang of regret almost as keen as they would have felt at the loss of a creature endowed with life. And indeed there is something in the action of a ship, whether she founders at sea or drives on shore, that bears a wondrous resemblance to the struggles of a living creature to escape its doom. She seems to shudder, and draw back, sometimes again and again, as if conscious of the destruction that awaits her, until at length she, as it were, summons up a desperate resolution to make the last fatal plunge—and all is over!

The deep regret of Captain Dobson, however, far exceeded that of the passengers, or even of any of the crew. He was an old man, and had commanded the ship for many years. In safety she had carried him through storm and tempest over many a thousand league of trackless ocean. He had come to regard her as a second home, and to know, and almost to love, every plank and spar on board of her. From the moment when he quitted her side (the last to leave her deck) he kept his gaze fondly fixed upon her, without giving utterance to a word, and when, at last, she sank to rise no more, a deep sigh escaped him. Raising his hat with one hand, and baring his grey head to the breeze, he grasped with the other the hand of Henry Talbot, who was seated next to him, and, his eyes dimmed with tears, and his voice almost choked with emotion, gasped forth, "She's gone—gone for ever. Through no fault of hers, poor thing! She couldn't help it. She would have carried me safely as long as I lived. I might have drawn my last breath on board of her. It was those rascally pirates who caused her loss. Well, well, she is gone; as good a ship, young man, as ever sailed, and—and I loved her dearer than aught besides on earth—except my wife and children."

This was the elegy over the ill-fated Amazon! Now that the ship had foundered, the crew and passengers turned their thoughts towards the shore. A compass had been passed into each boat; but it was soon discovered that the ironwork affected the needles, and rendered the compasses comparatively useless; the captain, therefore, took the lead in the pinnace, and directed the boat-steerers to follow as close as possible.

"The ship has gone," he said, addressing the crew and passengers, after he had issued the above directions; "but sad as that is, shipmates, things might have been worse with us. We might have been cast adrift in the broad Atlantic, a thousand miles from land, where we should have suffered from cold and hunger; and now, please God, though we are scant of provision, we are likely to reach land before we suffer greatly from hunger, even if things come to the worst. So keep a good heart, shipmates, and put your trust in Providence. Somehow or other it happens that we discover that we have most cause to be thankful to Providence after some great trouble has come upon us, and not when everything goes right with us. We have escaped with life from the pirates, and we are not very far from land, and we have plenty of water on board. Let us remember these mercies, and be thankful. We'll keep together if we can, and I shall steer sou-sou-west, as nigh as I can judge, for the west end of Cuba, and I do hope we shall reach the shore before nightfall. If otherwise—if we *should* get separated—all must do the best they

* Several years ago, when the present writer was serving on the West India station, a vessel was plundered in the Mexican Gulf, under precisely the circumstances narrated above—even to the final fatal catastrophe. It was, however, believed that the pirate captain had no hand in the wantonly cruel deed which might have consigned the whole of the passengers and crew of the plundered vessel to a watery grave. It was thought that this was the act of the wretches under his command, and that it was perpetrated without his knowledge. Twelve months later the pirate vessel was captured by a Spanish cruiser. Several of the men were condemned to death; but, through some unknown influence, the young captain, who was highly connected in Spain, escaped scot free.

can. And now, shipmates, in case that *should* happen, though I don't think it likely, I'll say good-bye, at any rate, and Heaven bless and protect us all!"

With this, the captain took his seat in the stern-sheets of the pinnace, and led off at about a hundred yards distant from the second boat, the other boats following in line; and for more than an hour, though the land-breeze was against them, all went well, except that, as the sun rose higher in the heavens, all began to feel the heat excessive, and to appeal frequently to the beakers of water.

Already they fancied they could perceive the shadow of the land in the distance, when a change came over the scene. It has been stated that the Gulf of Mexico is subject to frequent calms, but it is also subject to squalls of great violence, which are usually accompanied with torrents of rain, and thunder and lightning, and are sometimes—especially after a long succession of fine, calm weather—of long duration. One of these squalls now came on suddenly. Dark, angry clouds gathered in the western horizon. The land-breeze ceased to blow; but the sea-breeze, by which it is usually succeeded, did not set in. The sun, hitherto bright and dazzling, now appeared of a blood-red hue, as it glared through the lurid sky. The fish that were so lately sporting near the surface of the water disappeared in its depths. The sea-birds sought refuge on the land; and, though not a breath of air was stirring, the sea began to heave with a long rolling swell. The atmosphere became painfully oppressive, and air, sea, and sky alike, gave warning of an approaching desperate conflict of the elements.

Half an hour passed away, during which period, though the sky became completely overcast, and a few raindrops fell at intervals, plashing with startling noise upon the water amid the ominous silence of nature, the air continued calm. Then, without the slightest warning, the heavens appeared to open asunder from the horizon to the meridian, and a vivid flash of lightning darted forth, illumining air, sea, and sky with its fiery glare. This was the precursor of the tempest. It was instantaneously followed by a peal of deafening thunder that seemed to rend the air. A furious squall of wind burst forth, and rain fell in torrents—fell as it falls only within the tropics.

The wind, which rose from the westward, circled round rapidly from one point to another, increasing in force with every change, until it blew with the fury of a hurricane. The sea rose rapidly, and broke continuously over the gunwales of the boats, which were soon separated from each other. In a few minutes it became impossible to see a cable's-length ahead through the rain and drifting spray, while the thunder and lightning were incessant. It required all the efforts of the oarsmen to prevent the boats from broaching to, and the passengers were fully occupied in baling out the water which broke on board.

The pinnace, which contained Captain Dobson, Henry Talbot, and six of the female passengers, was soon left behind, being more deeply laden than the other boats; and from the moment those on board lost sight of their late shipmates, they saw them, never more.

Throughout the day, and far into the night, the hurricane continued with unabated violence. Then the wind began to subside, the rain ceased, and the thunder-storm, which had been blown back upon them again and again by the continuous shifts of wind, passed away. The wind, however, still blew with great force from the very quarter towards which they wished to shape their course, and the sea, which had been, in a measure,

beaten down by the excessive force of the hurricane, now rose higher every minute, and threatened to swamp them. The captain began to fear that they would be blown out into the Atlantic, while, to add to their misery, the salt water had got into the beakers, and rendered their contents nauseous and undrinkable, while their provisions were utterly spoilt by the same cause.

Drenched to the skin, and cramped in every limb, they sat in moody silence, and saw themselves borne irresistibly onwards, farther and farther from any hope of succour.

By noon, however, the wind completely died away, and the sun shone forth and dried their saturated garments. The intense heat now almost prostrated them, and increased the fierce thirst they were unable to allay. Some, urged by hunger, ate of the salt-water-soaked provisions, and still increased their craving thirst, and others, who drank from the beakers, were seized with spasms which caused them to retch violently. The sea soon became smooth as a mirror, and reflected back the fierce heat of the sun, rendering their condition almost unendurable. Some, who had drunk most deeply from the salt water in the beakers, were seized with phrenzy, and tore at themselves and their miserable companions; others threw themselves down at the bottom of the boat, and waited passively for death to relieve their sufferings.

All suffered in a greater or lesser degree from a fierce, maddening thirst, which was increased by the sight of the wide expanse of ocean by which they were surrounded. Like Coleridge's "Ancient Mariner," they saw—

"Water—water, everywhere, yet not a drop to drink!"

The day, and the long miserable night that followed, at length passed away, and when daylight again dawned, those who were not utterly prostrated, eagerly scanned the horizon, in the hope of seeing a sail or catching a glimpse of land. But they looked in vain—all around stretched the ocean's wide expanse, its glittering surface unchequered by a solitary object. Even those who still preserved their senses, now gave themselves over to despair, and almost hoped that the day would end their misery and their lives.

At length, an hour before mid-day, a low, dark object became visible in the distance. It drew nearer and nearer; and soon it became apparent that it was a small vessel, standing to the southward, and coming towards them, as if it had been especially directed to their relief.

The love of life returned, even to those who had apparently collapsed in the lethargy of despair. The vessel was steering right athwart their course, and must see them, and they watched her as she drew near, with a joy and gratitude that were almost frantic in their expression.

In less than an hour the boat was hailed by one of the vessel's crew. A feeble hail was returned. The pinnace was pulled alongside the larger vessel, and the cramped, enfeebled, almost perishing crew and passengers were lifted from their boat to her deck. She proved to be the *Marie*, fishing-smack, of St. Louis, St. Domingo, manned by negroes, who, having secured a cargo of fish, were bound homeward.

The negro captain cheerfully gave up his cabin to the rescued crew and passengers, and supplied them, cautiously at first, and then more abundantly, with food and water; and though some suffered severely during the progress of resuscitation, they were all eventually brought round, and before night again set in were tolerably comfortable. Towards the close of the following day the

smack reached port St. Louis, and they were safely landed.

At this period the negroes of the island of St. Domingo (now known as Hayti) had, but comparatively lately, gained their freedom and independence from France, after a bloody and desperate struggle, during which the majority of the French inhabitants of the island were cruelly massacred.

Thus Henry Talbot's voyage to New Orleans ended in his being landed, penniless and destitute, among the semi-barbarised negroes of a revolutionised island of the Antilles.

The negroes, however, behaved kindly to him and his companions, though, in the existing state of affairs, there appeared little prospect of a speedy release from the island.

Of the other three boats, which, together with the pinnace, quitted the side of the sinking Amazon, two, after their crews had suffered great hardships, reached the shores of Cuba. The third, in which were the two remaining female passengers, was swamped, with all on board, and picked up, bottom upwards, some weeks afterwards by an American trader.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

IF any letters can illustrate the truth of my introductory remarks ("Leisure Hour," p. 142) as to the biographical value of even the briefest notes, the letters of poor Haydon may be quoted in proof. A painter, *peint par lui-même*, never produced a more complete portrait of himself than he has done; not the less striking because of the strokes being unconsciously dashed in, in the spirit of the moment, with no retouching or glazing allowed. Unhappily, they only exhibit, in a stronger light than has been made too well known by previous revelations, the unfortunate fate of a man of eminent talents as an artist—an enthusiast in his art, full of energy, devoted to toil, and persevering to the last, struggling with his lot in vain, under the burden of blighted aspirations, disappointments, and crushed hopes. In all the relations of private life, as far as my testimony goes (I have a grand study of the "Arm of Uriel," inscribed to me within six months of his death, as a "friend of thirty years"), he was as impulsive, fervent, and liberal in the feelings of his heart as he was in the works of his hand. But the letters will speak for themselves.

B. R. HAYDON.

MY DEAREST SIR,—Your praise to-day is a reward for half the toils of my life. It affected us both, my dear Mary and myself.

We have endured more than we shall ever tell; but there is a delight in the spontaneous burst of approbation with which this picture has been received, that is a solace and compensation. You have stood first and foremost, in misfortune and in success. I cannot help feeling peculiarly touched by your kindness, and beg of you as a remembrance to keep the accompanying sketch of a favourite boy for my sake.

It is a mere trifle; but you admired it last year, and it will give us both great, the greatest pleasure, if you do so.

Yours ever, dear Sir,
B. R. HAYDON.

W. Jerdan, Esq.,
October 11, 1828.

The fervour of gratitude for very trifling favours, illustrating the generous nature of the man, is demonstrated by the annexed note. Though I have the "Uriel Arm," I regret having lost the sketch here referred to.

London, July 7, 1842.

MY DEAR J——,—Will you oblige an old friend by saying "His picture of the Heroine of Saragossa is nearly done;" that it will be one of my very best pictures; that it is to be raffled for; the Dukes of Bedford, Sutherland, Devonshire, Lords Palmerston, Francis Egerton, Earl Spencer, and several of the nobility have taken shares.

I assure you I feel the times, and have had three commissions deferred till next year.

I begin my cartoon in a few days, 13 feet by 10—my new success! though, after being thirty-eight years before the world, after having educated some of the most distinguished artists, it is not quite just to give up six months on the chance of a premium, and fight the battle over again with those I have instructed. However, I suppose "I am born for whatever is arduous," and glory in it. It is my duty and must be done, or after the uproar I have made they will swear I flinched at the day of trial.

I am, dear J——,
Ever yours,
B. R. HAYDON.

My next relates to a remark on an "error of the press," as most writers call such things, but which Haydon did not:—

London, Nov. 15, 1844.

MY DEAR FRIEND,—There is an old proverb, "When you are in the mud the more you stir the more ———."

You have demolished my classical repute, which was not very great before; and I deserve it, because it is the first time in my life I ever quoted a passage without *dissecting* it, and it shows the value of *anatomy* in everything. My last note made it worse. The amount of my Greek is simply that, by hard work and a Lexicon, I can construe any passage that bears on my point, if I have first hit on it in a translation. Now this passage I took from Emoric David. I made a classical friend copy it from Hippocrates, a friend you know, and except *οὐκ ἐννοῶν*, which he *separated*, and I never *looked out*, and ξ for ζ in *νομίω*, the passage stands as he sent it.

I am dreadfully annoyed, not at being found out to be careless and ignorant, but that I must appear assuming a disguise I had no right to, which is really not *my* character, as *you* know. It will be a warning to me in future, I assure you, and you have done me a great deal of good. Nothing remains in the mind if neglected. I was head boy at Plympton Grammar School, and read Homer with facility at that time; but the turmoils of my life have left nothing but a dreaming glimpse, which I occasionally revive for the sake of entering into a beautiful passage, but shrink from the classical drudgery of connecting lines, which, however useful etymologically, are disgusting poetically; in such prejudices a language slips from the mind; but then a man should not use it as if he knew it, and *here* I deserve your rap for my impudence, laziness, and neglect.

If you catch me again napping, cane me; but I'll not stir in future without being backed by both professors at Oxford and Cambridge. As they say in a murder, the truth is out.

I am, dear Sir,
Ever yours,
B. R. HAYDON.

At the Egyptian Hall, the exhibition of General Tom Thumb took hundreds of pounds, whilst Haydon's did not pay the rent of the room. He writes:—

London, May 20, 1846.

MY DEAR J——,—I found I was losing money every day; so I took advantage of an offer from a "Wonderful Lady" (another show) for the rest of the term, and marched off, bag and baggage, with colours streaming (not *FLYING*), drums beating, and three cheers for better luck next time. It is not the first time Tom Thumb has floored a giant! Is that bad? I am hard at work on "Alfred."

Yours always,
My dear J.,
B. R. HAYDON.

Alas, for the last example I may give, a short time before his sad death and in a fevered scrawl:—

London, Aug. 21, 184—,
14, Burwood Place.

MY DEAR J——,—In what do you wish me to *concede*? Would you have me give the lie to a whole life, for some 6 or 7 summers? As to my egotism—R—— was an egotist. The Duke is not, nor can Sir Walter.

Why? Because they were so *well* treated and their motives so appreciated; they are not obliged to make things square, to explain the justice of their own motives, and the injustice of their treatment. I was set upon, *without cause*, and revenged it. I did not begin, and did not know I could write till ill usage drove me to explain.

You should always remember different treatment at beginning would have made me a different man. Few have their best qualities drawn out by oppression.

For all I said I have *proof*—correspondence with all the ministers for twenty-five years.

Eastlake was my first pupil, though *that is denied!!!* though his letters prove it, and he is *but* carrying out my own views.

You remember the Cartoon Exhibition of my pupils, 1829, for you praised it. I do so, when I ought to concede. Let me hear your opinion and have your advice.

I am, dear J——,

Yours ever,

B. R. HAYDON.

ROBERT BELL.

About the same period as Professor Faraday, another long-tried worthy labourer, though in altogether a different line, passed from among his fellows in the fields of literature, and was, as he well deserved to be, honourably eulogised by his brethren of the pen. For he was a man of sound sense and solid literary acquirements, which he diligently employed on works of practical usefulness, independently of several productions of an imaginative nature. In his letters I have striking proof of his antagonism to malignity, and its misleading—for he was a thoroughly straightforward man; but in unison with my design, I prefer offering, though only a slight example of his general kindness of heart, a letter exhibiting his earnest desire to serve his struggling companions in the field of literature :—

MY DEAR J——,—I have read your article on poor Blanchard with deep interest, and cannot deny myself the pleasure of thanking you, as every friend of his ought to do, for the kind and genial spirit in which it is written. The very exhibition of such feelings amongst literary men is calculated to do good—to raise them above the low and miserable jealousies which sometimes creep into all pursuits, and to elevate their position both morally and socially. Your estimate of his character is admirable, and the whole record, full of heart and generosity, is worthy of the writer and his subject.

I have heard nothing more of any movement on behalf of the family, so that I take it for granted the matter is concluded,* so far as I am concerned, although I could have been of little service in promoting such an object. I must confess my feelings are deeply wounded at not having had an opportunity of testifying in any way my regard for the dear friend who is gone.

May all success wait upon your kindly and useful labour is the sincere wish of,

My dear J——

Yours ever faithfully,

ROBERT BELL.

Manor House, Chiswick, 27th February, 1845.

In his editorial capacity, I hope I may be allowed to add that Robert Bell bestowed conscientious pains-taking on his numerous works, especially his edition of the "British Classics." Historian, biographer, essayist, novelist, dramatist—in all departments of literature he was an industrious, honourable, respectable "man of letters."

DR. MAGINN.

I must make an exception to my theory of portraiture by Letters. So varied a character as William Maginn could not be delineated, even by a collection of his voluminous correspondence. A few glimpses are all we could catch of a man—a humourist, of great wit, extra-

ordinary learning,* and a singularly placid disposition. All the sharpness he had lay in his pen. His more estimable qualities were diffused throughout his life, manners, and conversation. To the latter, a slight impediment in his speech, as in that of Elia, often imparted an effect which off-spoken words could not have produced.

Respecting him I can only throw out a few brief touches. As a school-teacher in Cork, young Maginn began his literary career by some anonymous contributions to the "Literary Gazette" (then recently started), and corresponded under the signature of C. O. Crossman. How the anonymer came to be discontinued is rather an amusing anecdote. A draft on a Cork bank was sent to Cork, payable to Mr. Crossman, but there was no Mr. Crossman to receive it; and the subjoined letter affords a pleasing explanation of the circumstances :—

DEAR SIR,—Mr. Tatam came home by so circuitous a route that your letter of the 17th ult. did not reach me until yesterday.

As he has told you who I am, I suppose he has also informed you of the nature of my avocations, in which case you will not, I think, feel much astonished at the irregular and interrupted nature of my correspondence with you. In fact, I am so completely occupied that I have scarcely time to do anything beside my business. I shall, however, send you a trifle occasionally.

I affected the mysterious, as you call it, on no other account, but that I felt that what I sent was so very trivial, I was unwilling to put a grave-looking signature to my communications. As, however, you have dealt so very frankly with me, and as you desire it, I shall conclude by assuring you, in my real name, that

I am, dear Sir,

Your humble servant,

WILLIAM MAGINN.

11, Marlborough Street, Cork, December 18th, 1821.

Four months previous to this, however, a letter, keeping up the mystery, and still more characteristic of the *alibi* and *alias* humours of the writer (a practice largely indulged in by other contemporary contributors to "the press," as well as by himself), was received, which may be quoted among the incidental literary lights which peep out in such correspondence :—

SIR,—Your letter of the 6th of July came in due course, but I happened to be in England at the time of its arrival. This must serve as an apology for the very long delay in answering it.

I am quite aware of the trouble you must have, and should be very unwilling to increase it. You have quite misunderstood the meaning of my expression "writing in the dark." I intended to say by that phrase that I did not know what would be acceptable, and consequently was very often wasting my time and yours in sending you what would be of no use. I wished to know from you if there were any particular line in which you would direct me; and as I really like your journal very much, I should be happy in doing anything I could to serve you. I shall send you the trifles as usual.

There was no need of sending your name. Who could have told you that my name is different from my signature I know not; but I am acquainted with some wags who I am pretty sure will make use of that signature some time or other, to impose on you.

I send you two songs by a young lady; if worth anything print them.

I remain, Sir,

Your humble servant,

P. P. CROSSMAN.

Cork, August 13th 1821.

Engaged in "Blackwood's Magazine," and others in Edinburgh (as afterwards in "Frazer," in London),

* His knowledge of languages was almost worthy of the Abbé Mía. With the Eastern tongues he was familiar, being already a good classic; and I remember procuring for him, on the spur of some temporary move, all the books necessary for the study of the Swedish.

* Happily not needed.

the "*fun*" of hoaxing or mystifying had ample play; and, as he played at bowls, he had frequent rubbers. But as only one of them could be understood without a good deal of particular description, I shall conclude with a notice which touched myself, and showed a bit of the temper of my friend:—

DEAR JERDAN,—I have seen the "*Literary Gazette*" of last Saturday

Do you intend to enlist yourself in the business of libelling me, or copying those who do?

I ask merely for information; because if such be your design, it is a game at which two can play, and I hate being under an obligation to any man which I do not intend to return.

An answer will oblige,

faithfully yours,

WILLIAM MAGINN.

Standard Office, Bridge Street, Blackfriars.

Thursday.

Our misunderstanding was of very momentary duration; and I may say that though quite competent to sting, his use of the weapon was seldom waspish, and never ill-natured. No periodical writer has been more misrepresented by pseudo-biographers than William Maginn. His mystifying and hoaxing were good-humoured even when sarcastic, and no undue bitterness entered into his revenges, even when most provoked. His eccentricity was a constant source of pleasantry to friends, and no heinous offence to enemies.

WILLIAM UPCOTT.

I must afford a scrap to my old friend William Upcott, the great prototype of autograph collectors (a pursuit which, since his time, has grown into extraordinary magnitude), and a most vigilant inquisitor into muniment chests and family papers. He and his colleague, Mr. Ilbery, were the sub-librarians under Porson in the City Library, Old Jewry, and eminently deserve a memorial of grateful encomium for their attachment to their principal, and the unwearied care and attention they bestowed upon him, when sorrowfully needed, to the day of his death. Mr. Upcott's letter is, at any rate, a sign of character in the exemplar and promoter of what has become almost a fashionable or popular mania.

102, Upper Street, Islington,
January 12, 1841.

DEAR SIR,—When I last shook your hand a promise was made to look up some autographs for my old friend Mrs. Hutton, of Birmingham, which, I suspect, you have forgotten. I heard from her to-day to remind you. Do oblige me, and I shall at any time acknowledge the favour by doing what I can to serve you. In a few days I shall send her a packet. Devote half an hour in a *rummage*—let the produce of the search be left at Mr. Bunn, 10, Agar Street, Strand, who will convey the parcel to,

Dear Sir,

Very faithfully yours,

WM. UPCOTT.

ELEPHANT HUNTING IN SOUTH AFRICA.

BY T. BAINES, F.R.G.S.

THE graphic reports in the newspapers lately, of the Duke of Edinburgh's sport in South Africa, have recalled my own humble experiences on the same field. Some points relating to the elephant in South Africa may interest naturalists as well as sportsmen.

The elephant, once common in South Africa, down to the mountains of the Cape, has since the commencement of the colony been gradually driven backward before the deadly firearms of the European hunters; till—except in a few localities, where it may not be hunted without special permission—it is no longer to be met with in sufficient numbers to repay the cost of a

hunting trip, unless sought farther and farther every year in the interior. The native methods of hunting, whether by pitfall, by the chase of single animals, or even by battue, unless fire is used, seem not much to alarm the survivors; nor would the European, chasing them fairly with horse and rifle, soon drive the elephant from its favourite haunts. But when the hunter can no longer repay the cost of his outfit in this manner, and is obliged to waylay the animals by night at their drinking places, the sense of insecurity comes over them, which in a short time makes them retire to more distant and less persecuted districts.

The hunter, with his waggons equipped for the season's journey, like ships for a long voyage, with oxen numerous enough to supply the place of those killed by the tsetse, or poisonous fly, and as many horses as he can afford, to allow for losses by sickness, or casualties, or exhaustion in the chase, and with, generally, articles of barter, to fill up his cargo by purchase from the natives, reaches the country he has chosen for his hunting ground, and, having secured the friendship of the chief, or the confidence of the scattered natives, who flock readily to his waggons as soon as the object of his journey is made known, commences operations.

Scouts are sent out on all sides, and reports of spoor, or tracks, or of the most probable localities, are brought to him. Choosing those of the males as bearing the largest ivory, he follows, tracking them patiently for hours, sometimes for days, until he comes up with them and gives chase. The bull with the finest tusks is, if possible, selected, and by persevering efforts chased out and separated from the herd, each horseman, if there be more than one, choosing in turn his own victim, and not interfering with his comrades, unless it may be necessary to give them help.

Sometimes the successful shot is soon obtained. The after part of the lower lobe of the immense ear marks the death-spot, in which, if the ball strikes fairly, it either breaks the bones of the shoulder, or, missing them, passes into the heart or other vital organs. If possible the fire should be delivered when the fore leg of the elephant is thrown forward, as the skin is then more tightly stretched, and the thinner parts behind the shoulder more exposed. An experienced hunter will know at once whether the wound is sufficient to kill or disable the animal. Without loss of time he will chase and kill another, or perhaps a third—as one of my friend McCabe's hunters, Christian Harmse, has, I believe, frequently done—coming back again to take up the spoor and kill the first, if not already dead.

Sometimes the chase is long and arduous, and continues till the tired elephant resorts to the last expedient, of inserting his trunk into his mouth and drawing water from his stomach to refresh himself by throwing it over his skin; when, if the horse be not equally exhausted, his pursuer knows the chase is near its hoped-for termination. Sometimes, instead of fleeing, the elephant turns upon its persecutor, and with shrill and angry scream, uplifted trunk, and wide-extended ears, charges furiously. If the horse be already in motion, the hunter may urge him on yet more swiftly, and escape; but if not, terror may seize him at that dreadful scream, and, paralysed in every limb, he may stand trembling and unable even to make an effort for his safety. Perhaps the rider, throwing himself off, may escape by flight, or he may even shoot the furious animal while it wreaks its vengeance on the helpless steed. Sometimes, before this happens, a daring comrade may ride between him and the elephant, and draw the pursuit upon himself, trusting to the imperilled hunter

to recover the command of his horse, and come as soon as possible to his aid; or there is a chance, although a small one when such fury is excited, that the elephant may swerve and pass to either side.

at times too true; but it may be taken as a general rule that comparatively few animals are killed wastefully by Europeans. The professional hunter shoots for the ivory, and will not, except in cases of need, kill anything

A MOMENT OF PERIL.

Sometimes the hunter has to try the endurance of his horse in fair full flight; and many are the tales I have heard of hair-breadth escapes when the pursuing elephant, determined upon vengeance, has put forth his utmost speed, and the fugitive has at last gained ground enough to dismount and shoot his pursuer as he came up, or was fortunate enough to lead him past a comrade, ready with deliberate aim to bring him down. Sometimes, from loss of horses or the retreat of the herds into the "fly country," they must be followed on foot, and this is weary work. McCabe told me that once he and half-a-dozen friends had followed spoor all day, and had brought down their elephant by a running fusilade. Unable to move another step, the exhausted hunters leaned against the carcass, and thrust their fingers into the bullet holes to ascertain by the size of the orifice whose gun had given the fatal wound. While thus engaged the elephant planted one huge foot upon the earth and raised himself suddenly in their midst. Their activity was restored marvellously. They radiated in all directions, some catching up the guns which they had been too wearied even to reload; only one was ready to fire, when McCabe noticed that the elephant's eyes were closing, and that he was beginning again to sink in death.

Many persons, hearing of the number of animals killed by hunters in Africa, are apt to imagine them guilty of cold-blooded and useless slaughter. This is

but a "tusker," lest the natives who follow him should content themselves with the flesh and neglect to lead him to the animals he seeks. Sometimes he shoots more than they can consume, and finds them too indolent to cut it up and dry it; but more frequently it is a work of labour to keep the supply of meat up to the demand. The remote colonist, or the emigrant Dutch boer of the interior, knows too well the value of ammunition to throw it away wastefully. He goes out to supply his homestead; every animal he is able to shoot is carefully brought home, and the "huisvrou" exults in the prowess of her "man" if she can point to nine or ten "wilde beestes" or "bles boks" hanging in her larder. The true sportsman, who, like Captain Harris and many others, is a naturalist, a geographer, and an artist, has surely an object in view sufficient to justify him in rejoicing in his victory, when, after an arduous chase or exciting conflict, some mighty animal, seen perhaps for the first time, lies prostrate at his feet. Even where the higher qualifications I have named are wanting, the risk incurred is made the pretext to give the chase the character of fair play, and redeem it from the imputation of anything like cold-blooded slaughter. With the wasteful shooting of numbers, for the mere purpose of making a bag, I have no sympathy whatever.

In countries where elephants are less plentiful, low walls of stone are built by the water, or pits, to con-

ceal the hunters; or trenches ten feet long are dug, the middle being covered with stout logs that an elephant may pass over without breaking, and, well concealed by earth thrown over them, the ends are left open. Here the hunters watch or sleep by turn, each with one or more spare rifles lying beside him, till the animals approach to drink; when, from a few yards, or it may be only a few feet of distance, the deadly streak of fire flashes upward from the earth, and the creature falls either upon the spot, or retires to die at a short distance. By these or other modes of hunting, or by purchase from natives who have learned the use of firearms, the cargo of ivory is at length completed, and the hunter turns homeward to realise in Graham's Town, or other frontier markets, or in the Cape itself, the hard-earned reward of his labour.

SUBMERGED ISLANDS.

OUR readers will remember the sensation caused last November by the announcement that the island of Tortola had been submerged, and the relief experienced when the statement was proved to be incorrect. Tortola—one of the Virgin Islands, a cluster forming part of the West India Group—it was found had not been submerged, but the neighbouring island of St. Thomas had experienced a catastrophe only less disastrous. A fearful hurricane had burst upon the island, sweeping before it every object that lay in its course. Unhappily, such an occurrence was by no means unprecedented. The little island (until recently a Danish possession, but now American) had before been similarly devastated. The year 1837 is still memorable in the history of its calamities. Then, as recently, ruined dwellings overspread the land, and shattered vessels covered the neighbouring seas.

Those who have paid some attention to the influence at work on and beneath the surface of the globe, would feel but a qualified degree of surprise at the first announcement of the supposed submergence. Geology has done much to invert our notions of the relative stability of sea and land. The "ever-changing ocean" has been found to preserve a nearly uniform level;* while in relation to the land, which we are so accustomed to regard as the very type of fixity, the poet's words are amply verified—

"New worlds are still emerging from the deep,
The old descending, in their turn to rise:"

When movements of the earth's crust are spoken of, the majority of persons immediately think of earthquakes. But these terrific phenomena form but one class of terrestrial fluctuations, although the suddenness of their action renders them more conspicuous and impressive than agencies which are slow and gradual in their operation. They are closely connected with the phenomena of volcanoes. The latter may be defined as openings in the earth's crust, through which the products of igneous action make their escape into the atmosphere. As Strabo sagaciously remarked, eighteen centuries ago, they act as safety-valves for the gaseous and liquid emanations of the interior, and thus tend to diminish the violence of those convulsions which even now bury in ruins the proudest works of man, and carry the solid "earth into the midst of the sea."

Some two hundred volcanic vents have been observed in different parts of the world, but they are by no means uniformly distributed. Numerous regions have been mapped out by geologists as areas of volcanic action.

* Hugh Miller has shown that the sea-level is not absolutely unchanging, as some geologists have asserted.

The region of the West Indies is one of these areas, many of the islands being themselves the products of volcanic upheavals in past ages. A volcano in St. Vincent's poured out ashes and lava early in the present century; and Jamaica and St. Domingo have often suffered from shocks of earthquake. Scarcely three weeks had passed since the hurricane at St. Thomas's, when that shattered little island was visited by a sharp but transient earthquake, thus described by a correspondent of the "Times" newspaper:—"A faint roar was heard from seaward. Houses groaned and creaked; the earth heaved, and reeled, and danced beneath us, so that we could scarcely keep our feet. I have been in several earthquakes, but never felt one of greater intensity; and the inhabitants of St. Thomas, as well as of other islands, declare that they never felt one nearly so severe." This occurred on the 18th of November last; but, happily, the actual amount of damage done was comparatively slight.

That an earthquake should have followed so rapidly upon a hurricane, seems to support the view enunciated by some geologists, including no less an authority than Sir Charles Lyell. "Many of the storms termed hurricanes," he observes, "have evidently been connected with submarine earthquakes, as is shown by the atmospheric phenomena attendant on them, and by the sounds heard in the ground and the odours emitted. Such were the circumstances which accompanied the swell of the sea in Jamaica in 1780, when a great wave desolated the western coast, and, bursting upon Savanna la Mar, swept away the whole town in an instant, so that not a vestige of man, beast, or habitation, was seen upon the surface."

It has occasionally happened that one of the results of an earthquake has been permanently to alter the level of the district in which it has operated. After the great earthquake which visited the coast of South America in 1822, a portion of Chili was found to have been upheaved to a height of from three to seven feet. Reckoning the area of elevation at 100,000 square miles, Sir C. Lyell computes that this convulsion gave to the land an addition of fifty-seven cubic miles of rock. In 1837 the shore near Valdivia, more to the south, was elevated to an extent of eight feet. In February, 1835, Concepcion, another Chilean town, was thrown down, and the island of Santa Maria, distant twenty-five miles, was raised some nine feet. At Talcahuano the coast was raised about four feet in February, but appears to have subsided again to half that extent by the month of April.

In 1819 a large district at the mouth of the Indus experienced an extensive oscillation. One of the estuaries of the river was deepened in parts some ten or twelve feet. A tract of country, 2,000 square miles in extent, sank down, and the sea rushing in, it speedily became a vast lagoon. At the same time a neighbouring plain rose about ten feet, converting a long strip of level ground into an artificial mound fifty miles in length, and in some parts sixteen in breadth. A further subsidence afterwards took place in the year 1845.

It will be seen that phenomena of this kind, further illustrations of which might readily be adduced, are adequate to the production of extensive and terrible convulsions. Tortola happily was not submerged; but several authentic instances of the appearance and subsequent disappearance of islands in mid-ocean are on record. Volcanic eruptions and earthquake movements occur at sea as well as on land, and occasionally a submarine Etna or Vesuvius is seen to rise amid the watery waste, and rear its rocky crest, canopied with fire and smoke, above the surface.

To take an example not far from our own country:—Iceland is well known as a region of volcanic disturbance. In its neighbourhood a volcano burst forth in the year 1783, and produced an island bordered by high cliffs, while smoke and cinders were emitted from the interior. It was claimed by the Danish monarch, and dubbed *Nyöe*, or the New Island; but the sea reclaimed *Nyöe*, so that nothing remains but a reef of rocks some fathoms below the surface. Another small island was upheaved in the year 1830.

A volcanic cone appeared in 1811 near to the island of St. Michael's, one of the Azores, and gradually rose to the height of 300 feet; but it was in a short time washed away by the action of the waves.

A more noticeable instance is that of Graham's Island, thrown up in 1831 at a point in the Mediterranean some thirty miles from Sicily, and therefore within another well-known volcanic region. It seems to have risen gradually to a height of 200 feet, with a circumference of three miles. This was its maximum size; it then began to yield to aqueous action, and by the end of the year but a slight vestige remained above the sea-level. In a short time this also disappeared. Many islands, which are to us as permanent as the surrounding continents, exemplify the same structure, and point to the same mode of formation as the more transitory ones just alluded to. The Lipari Isles, north of Sicily, are of volcanic origin, and one of them, Stromboli, is still in a state of eruption, and has been so for ages; another volcano now emits only sulphureous vapours. This group was regarded in ancient fable as the abode of winds and tempests; and is celebrated by Virgil, at the opening of the "*Æneid*," as "the restless regions of the storm:—

"Where, in a spacious cave of living stone,
The tyrant *Æolus*, from his airy throne,
With power imperial curbs the struggling winds,
And sounding tempests in dark prisons binds."

Barren Island, in the Bay of Bengal, and St. Paul's, in the Indian Ocean, exhibit a similar conformation.

Changes of level of a much more gradual kind than those which have now been detailed are in progress in some parts of Europe. The shores of the Baltic, it would seem, are undergoing a slow process of upheaval, while the western coast of Greenland is sinking; and doubtless, if observations were multiplied, these imperceptible movements would be found much more general than we might at first be inclined to suppose. These phenomena, at all events, form part of the great series of conservative and reparative agencies by which new land is continually being won from the ocean, and the balance of terrestrial nature maintained. Thus regarded, we gain an insight into the place and power of the earthquake and the volcano, and are able intelligently to recognise them as contributing to the "general good," though "partial evil" is incident to their operation.

SKATING IN HALIFAX, N.S.

DURING my short stay in Halifax, Nova Scotia, it was my good fortune to witness several very curious and certainly extraordinary sights. In January, 1859, we had, as usual, some very severe frost, but accompanied with heavy falls of snow, succeeded by rapid thaws and heavy rains. The wind afterwards shifted to the north, and then fell to a dead calm. The thermometers fell rapidly, until in the city they registered five degrees below zero, and in the citadel as low as fifteen degrees below zero, Fahrenheit. The result of this alternation of

snow, thaw, rain, and frost was, that the harbour was completely frozen from the head of Bedford Basin to George's Island, a distance of about twelve miles. Twice was the harbour frozen, and on the second occasion the ice was formed as smooth as a looking-glass.

For the information of those unacquainted with Halifax Harbour, I had better state that it is about twenty-five miles in length, with a depth varying from five to sixty fathoms; it contains several large and valuable islands, and altogether ranks as one of the finest havens in the world; the rise and fall of the tide never exceeds six feet, and averages from three to four feet only. The city stands on a peninsula formed by the north-west arm and the harbour itself. George's Island lies at the end of this peninsula, and commands the whole harbour, southward from the city, being surmounted by a small but formidable battery. From this little island to the Narrows is about three miles; at the Narrows the waters are suddenly contracted from 1,500 to 200 yards, and then again suddenly expand into the basin—a truly magnificent sheet of water, being nine miles long and eight miles wide. At the time of which I write, the whole of this vast sheet of water was frozen to a depth of six feet, and from the Narrows to George's Island to four and a half inches; the latter, as I have before stated, was frozen as smooth as ice could possibly be.

On a Wednesday morning the large ferry steamer plying between Halifax and Dartmouth was compelled to stop on account of the extreme frost, for the ice closed up behind her as she passed along. At eleven she stopped running, and at twelve I crossed her track, so rapidly had the water frozen.

All Halifax was out on the ice, on foot or skates, or in little sleighs or sledges, or "coasters," as they are termed by the natives. The sight was a magnificent one: this huge sheet of ice, with thousands of people running, walking, or skating; ladies being dragged about on their little sleighs; and all life, motion, and gaiety; a bright sun overhead, the ice smooth, black, and starred with innumerable crystals; the dark-green fir-trees fringing the banks, and on the western side the city with its churches, steeples, and citadel: altogether it was a spectacle which once seen could never be forgotten.

One old gentleman told me that he had seen the harbour frozen two or three times, but never smooth enough for skating. Necessarily, the freezing of so large a surface of salt water must be of very rare occurrence.

At this time a great trotting-match was got up and held on the basin. There were twenty-four horses and sleighs entered for the match, each sleigh drawn by one horse only. It was certainly a singular spectacle to see a sleigh-race on the very spot that one was accustomed to sail over in the summer: the horses, with their jingling harness and gaudy trappings; the drivers, each with his distinguishing colour; crowds of gaily-dressed ladies and talkative gentlemen; sounds of merriment on all sides mingling with those of the sleigh bells.

It may seem strange that ice formed on salt water is much stronger and tougher than that which is formed on fresh water; that is, taking the same thickness of ice in both cases. I remember on that Wednesday morning, I and about a dozen of my friends were all standing together on the ice, chatting about the beauty of the weather and the fine skating, when one of the party suggested that we should try the thickness of the ice; we bored a hole, and found that it was only one inch and a third. On making this discovery we separated with as much alacrity as possible, each man skating in a different direction. A man may skate over fresh-water ice of only one inch thickness, but it will not support

him if he stops; he will then inevitably get a "ducking." The ice in the harbour did not last long, but soon became spotted with ice-swamps; that is to say, became in places soft and spongy, rendering it somewhat dangerous to skate upon. This liability to decay with age is the great defect of salt-water ice; for whereas fresh-water ice becomes thicker and stronger with every day's frost, salt-water ice, after five or six days of frost, becomes soft, muddy, and spongy.

Before the harbour ice broke up I had the pleasure of witnessing rather a novel spectacle from its glittering surface. The mail steamer arrived from England; we were sitting by the fire when we heard the signal guns. Down we ran, and on to the ice, to see her come up. There was a full moon, a cloudless sky, and the great black hull of the Cunard boat loomed blacker and huger than ever in the moonlight, as she forced her way up the harbour, the ice curling up her bows like spray, lights gleaming from masthead, paddle-box and saloon. All the wharves were crowded with spectators, who, like ourselves, had come down to see how the mail-boat would get on in four and a half inches of ice; she did not seem to mind it much after she first struck, but steamed up at about four miles per hour. One of the passengers told me that when she first encountered the ice she stopped dead; they feared she had gone on shore when she began to crash and pound up the ice with her paddles; all below thought that it was thundering, and ran up on deck to see what was the matter. The following day she went on her way to Boston. She had come in on the western side of George's Island, she went out on the eastern side, thereby making as wide a sweep as possible, and so cutting up the ice and clearing the harbour.

When skating was no longer practicable in the harbour we adjourned to the lakes on the Dartmouth shore. These lakes are very beautiful in the winter; the contrast between the dark-green fir trees fringing their banks, and the white gleaming snow, was very striking. On these lakes one could, if so disposed, skate for forty miles, with the slight difficulty of having to go on shore and walk at the junctions of the different lakes, where, the current being rapid, the water does not usually freeze; but during this winter even these little straits were frozen hard and fast. The Haligonian winter is supposed to be entirely over by St. Patrick's Day (the 17th of March), though, when I left on the 24th, there was still a foot of snow on the ground. But then the winter of 58-59 was an exceptional one in the annals of Haligonian, not only for its rigour but for its variety.

A WORD ON THE EAST WIND.

THERE was a time with most of us when we neither knew nor cared from what quarter the wind blew—when we had not the remotest conception that the direction of the air-currents could concern us at all. Those were the days of childhood's happy ignorance; when we knew nothing of the contents of the human thorax beyond what others chose to tell us; when lungs, and liver and heart, were things we sometimes heard mentioned, but did not trouble our heads about, having very vague notions of their existence; when the stomach was only known by its cravings, and the nerves were a mystery intelligible only to elderly people. A blissful state of things that, more permanent, it would appear, among our ancestors than with the average of mortals now-a-days. The first practical idea about the east wind that a young fellow gets hold of is that it is good for

sliding and skating, because it locks up the canals and streams, and covers the ponds and ornamental waters with practicable ice. We can well recall the eagerness and the profound interest with which we used to watch the weather-cock on the church tower in our skating days, and the mortification, not to say disgust, with which we saw the brazen indicator veer spitefully southwards.

As we grow older we grow more conscious of the mysterious machinery within us, and the atmospheric conditions without us, and of the marvellous and ominous sympathy there is between the two. But if we are in average health it is long before we begin to quarrel with the east wind. For a time we love to face it, and even take it to our embrace, feeling that it is a mighty breath, strong to build up the stalwart frame and renew the energies of youth. We revel in it, and, rejoicing in the freshness it brings, and the vigour it imparts, can repeat with pleasure Mr. Kingsley's rhapsody in praise of the east wind.

But by-and-by we find it rather too much for us—just a *little* too boisterous and rude; and though we hardly confess to that much, we catch ourselves shirking its proffered embrace, shunting ourselves to the lee side of available shelter when it blows hard, and buttoning up to the chin when it must needs be encountered. Still, we *can* encounter it, and get the better of it too, in a brisk walk or a gay canter along the open downs; and we do so occasionally, perhaps pluming ourselves on our hardiness. But it may happen that we do it once too often, or without sufficient care, and then the east wind gets a grip of our breathing apparatus, and shows that he is master, by consigning us to the bed or the easy chair, to a slop diet and teetotalism—to the hot mustard "foots." When a man, verging, say upon the fifth age of Shakespeare, has had one or two experiences of this kind, it is truly marvellous to note how learned he becomes upon the subject of the east wind. There is not the slightest occasion for *him* to look at the weather-cock for information; he has an index within him—a sort of weather-gauge—that tells him when it is coming, as sure as a gun; he scents it afar, even while sitting by his fire-side; can tell of its advent twenty, thirty, forty hours before its arrival; he will wake up in the night and say to his wife, "The wind is getting into the east," and, turning under the blankets, go to sleep again to dream of it and the plagues it may bring with it. He does not indorse the poet's invocation—

"Hail to thee, north-easter!"

Rather he dreads its approach, and only hopes to have done with it as soon as possible.

Here in London the east wind brings with it a characteristic shoal of phenomena more varied than agreeable. First, there are the swarms of ragged beggars dodging the police at every corner, and whining at you for coppers; or, in the guise of street traders, thrusting a box of lucifers in your face, and shiveringly begging for custom. Impostors, of course, you will say; and yet there is reality enough in their trembling frames, their half-clad limbs, their "looped and windowed raggedness," and the famine that gleams in their sunken eyes; for the east wind, that "whets the hunger of the pike," has whetted theirs; the fresh air, which is so good to raise an appetite, has raised theirs to the raging point, and they want the means of assuaging it. Then there are the frozen-out workers of various classes—the gardeners, with their symbolic vegetables borne aloft—the builders' labourers—the mudlarks, tide-waiters, and watermen of the Thames—on each and all of whom the east wind has laid an embargo, delivering them over for a time to the tender mercies of the public.

Now it is that the doctors are so busy, tearing about day and night in their broughams, or diving on foot into the back streets and slums, and doing battle with grim death in hand-to-hand combat. Now is business brisk and flourishing among the undertakers; for then

suffered even more in proportion, whole acres of tender plants and shrubs being destroyed in a single night, and that in many districts, the entire loss exceeding in amount, it was calculated, a million sterling.

The effect of a long-continued east wind upon our

MARCH WINDS IN TOWN.

the plumed hearse nods, and the black horses paw and prance along the hard roads to a profitable tune. How flourishing and how profitable is the sepulchral vocation, you may easily infer by examining the weekly reports of the Registrar-General, published in the newspapers. There you may chance to see that the weekly mortality, the average of which, in ordinary times, is something between eleven and twelve hundred, goes up, under the dominion of the east wind, in winter, to sixteen, seventeen, eighteen hundred; and if that dominion is prolonged, as it sometimes is, for months together, the death-rate may rise above two thousand a week, as it has done occasionally of late years. For do not asthma, bronchitis, catarrh, and a whole alphabet of diseases come along with the east wind, and shear away the threads of life, and fill our grave-yards with the forms we loved, and our homes with mourning?

Terrible at some seasons is the effect of the east wind on the springing vegetation. Cider-makers will tell you of years in which an easterly blast of only a few hours' duration has swept off the apple-blossoms of an entire county, extinguishing all possibility of a crop. In the spring of last year the crop, both of apples and pears, was all but annihilated through whole districts in central and southern England. By the same visitation, the nurserymen and horticulturists

shipping is most deplorable. Independent of wrecks, which, if the weather is stormy, are sure to be numerous on our eastern coast, there is the accumulation of sailing vessels at the entrance of the English Channel, which, not being able to advance against a head wind, have to beat about from day to day, from week to week, and it may be from month to month, waiting for a change of wind which may enable them to run for their several ports. It is quite impossible for any man who has not gone through it to imagine the dreary depressing misery of this situation when it is greatly prolonged. There is the tantalising proximity of home, which you are unable to approach, though you may perhaps catch sight of it looming as a grey line in the far-distant horizon. By-and-by there comes a failure in the stock of provisions, and, worse still, in the stock of water, and you are put on short allowance just at the very time when, from the provoking sharpness of the weather, you want double rations. Then it may, and it probably will, come on to blow hard, and you have to run before the wind in the direction you don't want to go, and make for the offing, even though starvation be staring you in the face. It has happened, doubtless, ere now that many a good ship has gone down with all on board in this struggle against the head wind that shut her out from home; and we know that steamers despatched with water and

provisions to the relief of others have found their crews and passengers reduced almost to the last extremity by famine. It is a most gratifying sight, when the wind changes, to stand on some bold cliff to watch the cloud of canvas coming up from the western horizon, and to know that the thousands of brave enduring hearts who have so long done hard battle with the elements shall speedily find rest in the desired homes.

Of course the east wind, like everything else in nature, has its good and benevolent uses. Some of these we have hinted at already, and we are fully aware of the existence of others. We know that it is a wonderful agent in purification; that it is a wholesale destroyer of the insect pests infecting vegetation; and that, by locking up the land in the grasp of frost for a time, it renders it far more fruitful when the thaw comes, and helps to make that "March dust" which is "worth its weight in gold." We gladly accept all these, and other like commendable qualities which need not be mentioned here, as so many compensations.

But, my dear, I am feeling the old premonitory twinge among my corns; I do really think the wind is again getting round to the east. Just see about my lambs-wool hose, will you, and air me a woollen shirt; and, do you hear? look up my bear-skin overcoat, which stood me in such good stead last winter.

ROMANCE OF HERALDRY.

BY THE EDITOR OF "DEBBETT'S HOUSE OF COMMONS," ETC.

II.

SCOTTISH Heraldry is particularly rich in historic interest. From the numerous anecdotes extant, concerning the origin of the grants of arms and armorial insignia, we select the following for the romantic incidents.

Early in the fifteenth century, as a husbandman, named Howison, and his son were returning from work with their flails, in the neighbourhood of Cramond Bridge, they observed some robbers attack a gentleman who was riding upon horseback, and whose social position was evidently one of high rank. The yeomen, seeing that the cavalier was being mercilessly treated, bravely tried to rescue him, and, although the assailants were numerically stronger, they succumbed to the vigorous blows they received from the Howisons' flails. The victim was much injured, and several wounds bled profusely. These the elder rescuer endeavoured to staunch, while the younger one ran home to procure a basin of water and a towel. On his return he bathed the injured parts, and subsequently held the basin while the stranger washed his hands. These services being rendered, the horseman announced to his astonished friends that he was King James I. (of Scotland), and had met with his misadventure in consequence of having strayed from his suite while on a hunting excursion. His Majesty expressed his gratitude to the Howisons in no measured terms, and, for the services they had rendered to him, he granted them the estate of Braehead by special charter, conditionally, that it should be held "servitium lavacri," a service that has upon several occasions been rendered to royalty by their descendants. And so recently as 1822, William Howison Craufurd, Esq., the then owner of Braehead, at a banquet given by the magistrates of Edinburgh to King George IV, presented to his Majesty a basin of water and a napkin, to enable the royal guest to wash his hands did he feel so disposed. In 1450 the grandson of the elder Howison, who was a burghess of Edinburgh, received a grant of arms, and, in commemoration of the bravery of his an-

cestors, supporters were also given, viz.:—two husbandmen clothed in blue, wearing the dress of the time, having bonnets on their heads, and being girt round the waists with belts, the dexter one having over his shoulder a flail proper, and the sinister one holding a basin and a napkin.

The above is not the only instance recorded of grants of arms being given for assistance rendered to Scottish monarchs on the hunting field. Apropos of this, the present Sir David Baird, Bart., bears as a portion of his arms a boar passant, and as one of his crests a boar's head erased, in commemoration of a service rendered by an ancestor, Baird of Auchmeddan, to William the Lion. It is related that this monarch, while hunting in a south-west county, wandered from his attendants, and, being much alarmed at the approach of a wild boar, called loudly for assistance. A gentleman named Baird, who had followed the king, arrived most opportunely, and, after a desperate struggle with the boar, succeeded in killing it. His Majesty showed his gratitude to his brave follower by conferring upon him a large grant of land, and the commemorative arms previously described.

The Cunninghames bear as their arms a shake fork sable, with the motto "Over fork over." The tradition respecting the origin of these is, that one Malcolm, the son of Friskin, assisted Malcolm, Prince of Scotland, afterwards Malcolm Canmore, to escape from Macbeth. Being hotly pursued, the Prince took shelter in a barn where Malcolm was at work. The royal fugitive having explained his danger, the husbandman proffered his aid, and, by forking hay or straw over him, effectually concealed him from the troops of Macbeth. On being subsequently awarded by the Prince the thanedom of Cunningham, Malcolm took as his name that of the estate, and assumed as his arms a shake fork. The chief line of this ancient family was subsequently represented by the Earls of Glencairn, the fifteenth and last of whom was the friend and patron of Robert Burns, who added increased lustre to the race in his beautiful poem the "Lament."

The Gordon family, represented by the Earl of Aberdeen, bear as a crest two naked arms holding a bow and drawing an arrow, in memory of their supposed ancestor Bertrand de Gourdon, who is said to have shot Richard Cœur de Lion while besieging his castle of Chalons, near Limoges, A.D. 1199.

The crest of the Grants of that ilk and Freuchie, is a burning hill, and their motto "Stand fast." The hill in question is that of Craigelachie, or the mountain of the cry of distress, situated opposite Rothiemurchus, in Scotland, and the fire refers to the fire that was lighted there when the chief wished to call the whole of his clan together in Strathspey, the seat of the Grants in Morayshire. The motto of the laird was "Stand fast," and the inferior chieftains re-echoed it to their troops as "Stand firm," "Stand sure," or in kindred phraseology. While alluding to the Grant family, we may mention the motto of "Jehovah jireh" (the Lord will regard it), borne by the present Sir Archibald Grant, Baronet, as being the only instance of a Hebrew motto existing in Scottish heraldry. The recipient of it was Sir Francis Grant, an eminent lawyer, better known as Lord Cullen, a senator of the College of Justice, and a hearty advocate of the Scotch Union.

Sir Andrew Snape Hammond, Baronet, bears as one of his crests two arms erect, issuing from clouds, in the act of removing a human skull from a spike, while above the skull is a marquess's coronet between two laurel branches. This peculiar ensign represents the removal of the head of James Graham, the gallant Marquess of

Montrose, from the Tolbooth of Edinburgh, where it had been placed after his execution, on May 21st, 1650, an act that was performed by a maternal ancestor of the present baronet.

The motto "Grip fast," of the Leslies, the head of whom is the Countess of Rothes, is generally said to have had its origin in an incident that occurred to the founder of the family, who saved Queen Magarite of Scotland from drowning, by seizing hold of her girdle when she was thrown from her horse while crossing a swollen river. She cried out, "Grip fast!" and afterwards desired that her words might be retained as her preserver's motto. A somewhat different interpretation is, however, preserved in the Leslie family, in a book printed "for private use" by Colonel Charles Leslie, K.H., who styled himself "twenty-sixth baron of Balquhain." In this volume it is stated that the founder of the family was Bartholomew, a noble Hungarian, who came to Scotland with Queen Magarite, A.D. 1067. He was much esteemed by King Malcolm Caenmore, whose sister he married. In his capacity of chamberlain to Queen Magarite it was his duty to accompany her Majesty in her journeys, and, as there were no carriages in those days, she rode behind him, upon horseback, upon a pillion. On one occasion, while fording a stream, the Queen slipped and nearly fell off, whereon Bartholomew cried out, "Grip fast," and to which her Majesty replied, "Gin the buckle bide," there being only one buckle to the belt by which she held on. After this his exclamation was given as the family motto, and two more buckles were added to the belt of the pillion, and also to the charge upon Bartholomew's arms, which had heretofore consisted only of one buckle on a band.

After the death of King Robert the Bruce, in 1329, a distinguished member of the Locard family, Sir Simon Locard, of Lee, accompanied Sir James de Douglas to the Holy Land on a special mission to inter there the heart of the deceased monarch. After their return, Sir James de Douglas assumed as his arms a human heart, ensigned with an imperial crown—a charge that is still borne by the families of the Dukes of Hamilton and Buccleuch, etc. Sir Simon Locard also assumed as his arms a human heart within a fetter-lock, and changed his name to Lockheart, in which manner his descendants spelled it until within a comparatively few years ago, when the orthography was changed to Lockhart.

In the case of the Homes of Ninewells, Berwickshire, is found an instance of a charge in the arms having originated in the name of the family estate, whereon there exist nine natural springs. The arms in question are a lion rampant within a bordure, on which are displayed nine fountains, or wells.

The partially broken-down dyke, or wall, borne as a charge in the arms of the Grahams of Inchbrakie, refers to the destruction, by an ancestor, of part of the wall and ditch made by the Romans between the Forth and the Clyde, to keep out the Scots, and the locality of which is, even to the present day, styled "Graham's Dyke."

"Quæ amissa salva" (What was lost is safe), the motto of the Earl of Kintore, refers to the preservation of the regalia of Scotland by Sir John Keith, the first Earl; who, during the usurpation of Cromwell, buried them in the church of Kenneft, and pretended to have carried them to France, in consequence of which all search for them ceased.

The mottoes of the different branches of the Campbell family are, for the most part, very similar. The motto of the armorial bearings of the senior branch is "Follow me;" a significant one, that was assumed by Sir Colin Campbell, laird of Glenorchy, and Knight

Templar of Rhodes. Several cadets of the family assumed mottoes analogous to that of this chivalrous knight. Thus when the chief called "Follow me," he met with a ready answer from Campbell of Glenfalloch, a son of Glenorchy, who replied, "Thus far," that is, to his heart's blood, which he illustrated by assuming as his crest a dagger piercing a heart. He of Achline responded "With heart and hand," and he of Achallader "With courage;" and while Campbell of Balcardine announced "Paratus sum" (I am prepared), he of Glenlyon was more cautious, and published as his motto, "Quæ recte sequor" (I follow the things which are right). A neighbouring knight, Menzies of Menzies, now represented by Sir Robert Menzies, in token of friendship also replied, "Vil God I zal" (Will God I shall), and a friendly baron, Flemmyng of Moness, answered the chieftain's call with the motto "The deed will show."

Our budget of Scottish anecdote is far from exhausted; but that we may not be considered as giving undue prominence to one country, we refer to incidents of an equally interesting nature that have occurred elsewhere.

Sir Richard Bulkeley Williams-Bulkeley, M.P. for Anglesey, bears as a charge in his arms three Englishmen's heads couped, which is a direct allusion to a signal victory gained by Ednyfed Vychan, chief councillor to Llewellyn ap Iorwerth, King of North Wales, in an attack made upon the Welsh frontiers by the English army under the command of the Earl of Chester. In this action he personally killed three of the enemy's chief captains or commanders, and was in future greatly esteemed for his bravery.

A sword and a thumb, which are the arms of the Hart family, of Sligo, are traditionally supposed to have had their origin in the undermentioned circumstance. When the fleet belonging to the twelve Milesian brothers was coming abreast of land, on the north coast of Ireland, the brothers contended among themselves as to which should reign over Ireland. They unanimously agreed that whoever first touched land should be king. But as they neared the shore, Art, one of the brothers, drew his sword and cut off his thumb, and threw it with the sword upon the land. At the same time his wife threw herself overboard, swam to shore, and with her dart killed a deer as it ran by. In allusion to the latter circumstance, a female and a stag are borne as supporters.

The founder of the Fortescue family was Sir Richard Le Forte, who protected William the Conqueror at Hastings, by bearing a shield before him. From this circumstance the French word "escue" was added to the original word "forte," and Sir Richard assumed as his motto, "Forte scutum salus ducum" (A strong shield is the safe guard for leaders.)

An owl, ducally gorged, the crest of the Fowlers of Staffordshire, is said to have originated from the vigilance of Richard Fowler, of Foxley, a crusader of the time of Richard I, who on one occasion saved the Christian camp from a nocturnal surprise, and for this service received from his royal master the honour of knighthood on the field, and was also ordered to assume as his crest the vigilant owl, in lieu of a hand and lure, which he had previously borne.

Sir Stephen Richard Glynne, Bart., of Hawarden Castle, bears, as a portion of his arms, a human leg, coloured black, and couped at the thigh. This is supposed to have been borne originally from the name of their ancestor, Gilmin Droed-tu, the latter word being interpreted as the Welsh for black leg.

The Clyntons, now represented by the family of Hig-

gins, of Eastnor, were formerly large landowners and yeomen in Herefordshire. Their crest, a wheatsheaf, and the motto, from the second Georgic of Virgil, "Patriam hinc sustinet" (Hence he sustains his country), are supposed to indicate that wheat, or agriculture, was the staff, or support, of the family.

According to the laws of heraldry, if in warfare any man take prisoner either a prince or noble, he is entitled to assume the arms of his captive, and such insignia will lawfully descend to his posterity. For illustration of this we may mention the arms of the Kynastons, who bear a red chevron on an ermine field, as descendants from Roger Kynaston, a Yorkist, who, at the battle of Bloreheath, near Drayton, county Salop, September 22nd, 1459, under the command of the Earl of Salisbury, killed Lord Audley, the Lancastrian leader. Two years later, when the Earl of March ascended the throne, he knighted Sir Roger, and assigned to him the confiscated arms of the fallen Dudley. In a similar manner, when Sir Richard Waller, one of the heroes of Agincourt, took as prisoner the Duke of Orleans, he was permitted by King Henry IV to assume, in addition to his crest, a shield of the arms of the royal prisoner. And the Holmes, of Paull-Holme, bear the arms of the King of the Scots, who in 1346 was taken prisoner by their ancestor Sir Bryan Holme.

The Grosvenor family, the head of which is the present Marquess of Westminster, were originally "Gros Veneuro," or grand huntsmen to the Dukes of Normandy, and the talbot (or dog), which they bear for a crest, was the badge and token of their office.

The origin of the three crowns borne in the arms of the Leches of Derby is thus recorded: "One of this ancient family living in Barkshire in ye time of King Edward I^{urd}, entertained and feasted three kings in his house; one ye Kinge of England, ye Kinge of France, and ye Kinge of Scotts, which two kinges were at that time prisoners to Kinge Edward; whilst Kinge Edward, to requite his good entertainment and other favours, gave him three crowns, &c., which coate is borne by the name and family dispersed into many other countays."

From Llewellyn ap Ynyr (Lord of Yale) are descended the Lloyds, of Bodidris, and of Gloster, King's Co. They bear the arms of their ancestors, who shared with distinction in the victory gained against the English at Crogen (Chirk Castle) in 1115, by Owen Brogyntyn, Lord of Edeirnion, and other sons of Madoc, Prince of Powys-Padoc, under the command in chief of Owen Gwynedd, Prince of North Wales. For his service in battle Llewellyn ap Ynyr had a grant of the township of Gelligynan, in Yale, with a coat-of-arms, conferred upon him, under the following circumstances. While in conversation with the prince, after the battle, Llewellyn accidentally drew his left hand, which was smeared with blood, across his sword, and left the marks of his four bloody fingers. The Prince, observing this, ordered that he should in future carry similar marks upon his shield.

"Jour de ma vie" (The bright day of my life), the motto of the West family, the head of which is Earl Delawarr, refers to the exploit of an ancestor who took John, King of France, prisoner at the battle of Poitiers.

As an example of modern heraldry granted for scientific attainments, we may mention the arms of Sir John Herschell, the celebrated astronomer, which are, on a mount, a representation of the forty-feet reflecting telescope with its apparatus, and the astronomical symbol of Uranus or Georgium Sidus, the crest being a terrestrial sphere, thereon an eagle with wings elevated, while the motto is "Cœlis exploratis" (Having searched the heavens).

Varieties.

LONDON FLOWERS AND LONDON CHURCHYARDS.—Do not say that flowers will not come up in London—look at the window-gardens of poor people, and at the wonderful things which, despite the smoke, have been done in the different parks during the last few years. Why, all last summer and autumn there were Cannas and Sarracenias, the dwarf palm and the castor-oil plant, and many other distinguished foreigners, freely naturalizing at the corner of Rotten Row. But our thoughts are not soaring to sub-tropical or costly gardening; we speak of the common hardy annuals, which cost no more than a penny or twopence the packet, and which will, with proper care and management, turn a bare unhappy plot of London soil into a place of beauty. And everybody knows that a little labour at the rake and hoe, water now and then, and half a cart-load of gravel, or sifted shells between the beds, will render the effect of the investment splendid. You do not want a large garden to produce it; nothing is so small as not to repay care with beauty. Where nothing else will grow, scarlet runners can; and if you saw for the first time the coral flowers and broad green foliage of the "poor man's vine," how you would marvel that it could ever be a bold and vulgar thing even to allude to such a cookmaid's vegetable! Where, again, will not the nasturtium thrive, with its blossoms of golden tissue, pale or ruddy, and its great flat leaves, which love the light so much, and turn so constantly to the sun? We say—and this brings us to the point—that there is no spot, even in dingy, smoky London, where something pleasant may not be done by the help of flowers. Why, then, when we are gardening everywhere, should we forget the dismal-looking churchyards, which might so easily be made bright and cheerful? Go down the Strand, go up Drury Lane, into the City, into the suburbs, anywhere about the metropolis, and note what melancholy spots those churchyards are. At little cost and trouble we might plant flowering trees and hardy shrubs which would make every churchyard in our great city a beautiful sight instead of an eye-sore.—*Daily Telegraph*.

PATRIOTISM AND RELIGION.—"Of all the dispositions and habits which lead to political prosperity, religion and morality are indispensable supports. In vain would that man claim the tribute of patriotism who should labour to subvert these great pillars of human happiness, these firmest props of men and citizens. The mere politician, equally with the pious man, ought to respect and cherish them. A volume could not trace all their connections with private and public felicity. Let it be simply asked, Where is the security for property, for reputation, for life, if the sense of religious obligation desert the oaths which are the instruments of investigation in the courts of justice? And let us with caution indulge the supposition that morality can be maintained without religion. Whatever may be conceded to the influence of refined education on minds of a peculiar structure, reason and experience both forbid us to expect that national morality can prevail in exclusion of religious principle."—*Washington's Farewell Address to the People of the United States*.

HOOKE'S DYING WORDS.—I have lived to see that this world is made up of perturbations; and I have long been preparing to leave it, and gathering comfort for the dreadful hour of making my account with God, which I now apprehend to be near. And though I have by his grace loved him in my youth, and feared him in my age, and laboured to have a conscience void of offence towards him, and towards all men; yet if thou, Lord, shouldst be extreme to mark what I have done amiss, who can abide it? And, therefore, where I have failed, Lord, show mercy to me, for I plead not my righteousness, but the forgiveness of my unrighteousness, through his merits who died to purchase pardon for penitent sinners. And since I owe thee a death, Lord, let it not be terrible, and then take thine own time, I submit to it. Let not mine, O Lord, but thy will be done! God hath heard my daily petitions; for I am at peace with all men; and he is at peace with me.

BANK RATE OF DISCOUNT.—From 1704 to 1814, a period of 111 years, there were but five changes from 4 to 5, and from 5 to 4 per cent. From 1815 to 1835 there were but three variations, the highest 5 and the lowest 4 per cent. From 1836 to 1843 there were eight changes, the highest point reached being 6 per cent. From 1844 to 1858 there were forty-nine variations between 2 and 10 per cent. From 1859 to 1863 we had forty-four changes, ranging from 2 to 8 per cent.; and in 1865 and 1866 there have been thirty variations from 3 to 10 per cent.—*Solicitors' Journal*.

AN ABRUPT DEPARTURE.

THE MORTONS OF MORTON HALL.

BY THE AUTHOR OF "THE GREAT VAN BROEK PROPERTY."

CHAPTER XXI.—MR. ASTON RECEIVES AN UNWELCOME LETTER FROM NEW ORLEANS.

OCEAN steam navigation was but a doubtful dream of the future at the period to which this history relates, and the sailing-packets of those days, though fleet vessels of their class, were more dependent upon wind and weather than the steamships of the present period. They were often days, and sometimes weeks, behind their time, and this happened to be the case with the

packet that was due at the date at which the present chapter opens.

Three months had elapsed since Henry Talbot had embarked for New Orleans, and his sister Mary—inasmuch as he had promised to write, if it were but a line, the moment he stepped on shore at New Orleans—was anxiously awaiting the news of his arrival. She made sure that the packet now due at Falmouth would bring the eagerly looked-for letter from her brother.

Mr. Aston (as I shall still designate him) had completely recovered his ordinary robust health, and had become so partial to St. David, and the new friends he

had found in the little secluded Cornish village, that he felt greatly inclined to make it his permanent home, though he was still doubtful whether it would be necessary for him to return to America to make arrangements respecting the vast property he possessed in that country, or whether he might not safely trust those arrangements to his son.

Nothing had been heard of the lost pocket-book or its contents, and, as the individual most concerned in the loss chose to be silent on the subject, no one else troubled himself in the matter. Mr. Sinclair and his friends, indeed, were of opinion that Mr. Aston secretly believed, as they did, that he had lost his pocket-book during his visit to Falmouth, the day before he was seized with his last attack of illness; but that, having asserted so positively that he had lost it in the village, he would not draw back from his assertion, and preferred that the affair should be forgotten.

Jemmy Tapley, who had been deputed to make secret research among the people of the village, completely exonerated the fishermen from any complicity with, or knowledge of the robbery; and if the old seaman had his own suspicions relative to the mysterious affair, he kept these suspicions to himself.

It has been already hinted that a suspicion had entered the mind of Mr. Aston that Henry Talbot had possessed himself of the pocket-book and its contents. He strove to banish this suspicion, but was unable to do so; yet—though less communicative than usual—he still continued to regard Mary with an almost paternal interest.

He received letters from America by every mail, and, as I have heretofore stated, always received these letters directly from the hand of the postmaster. He also expected that Mary would receive a letter from her brother by the packet now due, the arrival of which he looked forward to with no little anxiety, since he had made up his mind that in case Mary received a letter he would make the long delayed disclosure of his relationship.

He was, however, doubtful whether or not to acquaint Mary with his secret suspicion relative to her brother; and this doubt was the cause of much anxiety and uneasiness. The young man's subsequent return to the village seemed now to be but a confirmation of his guilt, since, knowing that the individual he had so cruelly and basely plundered was lying in an unconscious condition, he returned without the slightest peril of detection, while at the same time, in case of his victim's eventual recovery, and discovery of his loss, the fact of his return to the village would be regarded as a sort of presumptive evidence that he was alike innocent and ignorant of the robbery.

Mary was as yet unaware that Mr. Aston had met with any loss; and of course he acquitted her of any complicity with her brother, and held her entirely innocent. Could he have hoped that she could be kept in ignorance of the theft, and the circumstances under which it was committed, he would have remained silent on the subject. But he could not entertain any such hope. He, holding the suspicion he did, could neither speak of Henry as he had formerly spoken of him, nor could he feel himself justified in fulfilling the promises he had made to the young man to advance his interests in America; yet it would be necessary, if he disclosed his relationship, to explain to his niece why he had cast off his nephew. He felt that it would be a painful and delicate matter to acquaint a fond, unsuspecting sister with his suspicions, and he naturally shrunk from the unpleasant task.

The American packet arrived at Falmouth eight days

behind its time; and, as usual, Mr. Aston went to the town to receive his letters from the postmaster. An hour after his arrival at Falmouth he was seated in a private room in one of the hotels of the town, with a heap of letters and newspapers on a table by his side.

He had already read the letters from his son and daughter, and he now selected one, hap-hazard, from the heap.

It chanced to be from a merchant of New Orleans, with whom he had business dealings, and to whom he had written that a young friend (Henry Talbot) was about to sail for the "Crescent City," on board the ship *Amazon*, and to request the merchant to show the young man all the attention in his power during his sojourn in the southern metropolis. He opened the letter and read as follows:—

"New Orleans, December 10, 18—

"My dear Morton,—Your letter dated 10th Sept. came duly to hand. I regret, however, to inform you that the ship *Amazon*, on board of which your young friend Henry Talbot was, as per advice, to embark, was boarded and plundered by pirates in the Gulf of Mexico, on the night of the 4th inst.

"The pirates spared the passengers and crew from massacre; but they scuttled the ship before they quitted her, and at daylight in the morning all on board took to the boats.

"A hurricane shortly afterwards sprung up, and swept over the Gulf for two days with terrific violence; and, after encountering terrible hardships, two of the boats, with their crews, were picked up off the coast of Cuba, and were safely landed and hospitably entertained at Havanna.

"Four of their number, however, had perished during the hurricane, and the survivors were almost in a dying condition. Happily, however, all eventually recovered, and were sent on to New Orleans. From them we learn that four boats in all, all scantily supplied with provisions, quitted the ship only a few minutes before she foundered.

"The boats were separated during the hurricane, and there is little doubt that all on board the pinnace and the long-boat, numbering twenty-two, crew and passengers included, have perished. * * *

"I have just learnt, since the above was written, that one of the missing boats, the long-boat, has been picked up in the Gulf, *bottom upwards*. The pinnace, in which was the captain, several ladies, and your friend, is still missing; and, as she is said to have been the most deeply-laden boat, there is little doubt as to her fate. This is all the information we have yet received. * * *

"P.S.—It is of little consequence now; but why, my old friend, did you wish to pass with the young man by your wife's maiden name? It was one of your odd whims, I suspect. Poor fellow! it matters little now to him, whatever was your motive."

The letter contained other news, but Mr. Aston read no more.

Starting from his chair, he paced the room in a state of great agitation. Though he had not caused the accident, his conscience accused him. He had not given utterance to the words; but, more than once since he had suspected Henry Talbot, while his heart had yearned towards the orphan girl, his sister, he had thought that, if any accident were to befall her brother, his own difficulties would be removed—the trial he dreaded would be spared him. He had thought how then he would let his suspicions of Henry's dishonesty

sink into oblivion, and would avow himself Mary's uncle, and be to her a second father, for his own dear sister Mary's sake, and present her with a new brother and sister in his own son and daughter.

Now he bitterly blamed himself for having indulged such thoughts. All his love for the youth, whom he now believed to be beyond the reach of human judgment, of love or hatred, returned to him; and again it seemed possible that the suspicions he had entertained were without foundation. He would gladly have lost ten times the amount, could he have recalled the youth to life; and had he then stood before him and confessed his guilt, he would gladly have accorded him his forgiveness.

Then he wondered whether Mary had heard, by any means, of the sad fate of the Amazon, and he resolved to return forthwith to St. David, and visit her at her lodgings, where, if she had not heard the fatal news, she would be anxiously awaiting a letter from her brother, or perhaps, if the village letter-carrier had already been his round, would be wondering at, and sorrowing over Henry's silence.

Without waiting, therefore, to read the remainder of his letters, he thrust them in his pocket, and immediately returned to the village.

CHAPTER XXII.—IN WHICH MR. ASTON MAKES AN ASTOUNDING DISCOVERY.

THE letter-carrier of St. David had been his round, and had brought no letter to the farmhouse whereat Mary Talbot resided. It was late in the evening, and Mary was seated at the table in her own little parlour, wondering greatly at her brother's silence; sometimes blaming him in her heart for his carelessness; sometimes dreading lest some accident had occurred to prevent his writing.

"It is more than three months ago since he sailed," she thought to herself, "and he promised me faithfully that he would write me—though it were but a line—the very day on which he landed in America. Mr. Aston tells me that the voyage might have been made in four weeks, and would most likely not be more than five or six, and even were it six weeks, both ways, there has been more than time for me to receive a letter." Then she began to revolve the possibility of accident, and recalled what Mr. Sinclair had said, that sometimes, if vessels met with bad weather and suffered any damage, they put into one or other of the West India Islands to repair. "Perhaps," she continued, "that has been the case, and then Henry could not write. I will try to think it is so, and trust that the next packet will bring me a letter; but a month is a long time to wait in suspense. Poor dear Henry! I wish he had been content to remain in England."

These, and such thoughts as these, passed through Mary's mind; but though she strove to console herself, her pale face betrayed her serious anxiety.

Presently she rose, and, stepping to her writing-desk, brought forth the locket and chain her brother had given her for a keepsake.

"I told Henry I needed nothing to remind me of him when he was gone from me," she said, half aloud, as she resumed her seat; "yet, after all, I am glad that he gave me this, poor fellow. I only wish that *his* likeness was within it in place of the one that is there. Still, I am glad that I thought to clip a lock of his hair and place it inside."

She touched the spring, and the locket flew open and disclosed a lock of dark, curling hair, twined lovingly round the miniature within. She removed the hair,

pressed it fondly to her lips, and sat for some moments in deep dreamy reverie.

Presently she was startled from her reverie by the sound of a well-known voice in conversation with the mistress of the farmhouse.

"That is Mr. Aston's voice!" she exclaimed; "what can have brought *him* to the farmhouse at this late hour?"

Then she thought—

"Perhaps he brings news of Henry. He has been to Falmouth to-day. Perhaps he brings me a letter."

The joyous expectation restored the colour to her cheeks. The visitor was ascending the stairs towards her room, and with a beating heart she rose from her chair, sprang to the door, and, flinging it open, met Mr. Aston on the threshold.

"You bring me news of my brother?" she cried.

Then, bethinking herself of the trinket which lay upon the table, and ashamed lest Mr. Aston should witness her sisterly affection, and deem it foolish weakness, she turned back quickly to conceal the hair and remove the locket.

Mr. Aston, however, had already caught sight of the trinket, and had fancied that he recognised it.

"I have not exactly brought news *from* your brother, my dear Miss Talbot," he had commenced to reply to Mary's impulsive question, feeling keenly the painful difficulty of the task he had imposed upon himself, when his utter astonishment on perceiving the locket upon the table (his attention having been especially directed towards it by the young lady's sudden movement), and the still more painful suspicion which flashed to his mind, caused him for the moment to forget the purpose of his visit.

"Ha! what is this?" he exclaimed, advancing to the table before Mary could reach it, and taking up the locket. The flush of joyful anticipation that had risen to the young girl's cheeks deepened to a blush as she hesitatingly replied—

"It is a locket—a keepsake that Henry gave me on his last visit, a few days before he sailed."

Mr. Aston stood gazing into her face with a strange look, that surprised and somewhat frightened her.

The tone in which he had questioned her was different from his usual voice, and his manner seemed altogether so strange that, coupling with it the unseasonable hour of his visit (in fact, it was the first time that he had ever visited her at her lodgings), she began to fear that his intellect was affected, or, though she had never seen him in such a condition, that he had taken too much wine.

He, however, had turned his gaze from her, and was now occupied in closely scrutinising the locket and the miniature within it; and, forgetting her momentary alarm, in her anxiety about her brother, she repeated her question—

"Do you bring me news of Henry? I have been so anxious," she went on. "I knew that the packet had arrived, and, as I knew you had been to Falmouth, I thought, I hoped, that you had brought me a letter."

Mr. Aston's heart would have been filled with pity had he at that moment looked into her face, and seen the earnest, pleading expression of her eyes, and marked the anxious tone of her voice.

He, however, had misunderstood the quick movement to gain possession of the trinket, and the deep blush that had dyed her cheeks with crimson, and the marked hesitation in her reply to his question, and he suspected that her apparent anxiety was feigned, to withdraw his attention from her brother's keepsake.

Without raising his eyes, he replied, as she fancied, somewhat harshly—

"I said I had *not* heard any news *from* Henry;" and presently added, "So your *brother* gave you this?"

A mingled feeling of shame, vexation, and anger now took possession of her. She suspected that he fancied that the locket was a *gage d'amour*, and she felt that, even if it were so, there would have been no harm in her possession of such a pledge—though she would not willingly have shown it to *him*; and that, under any circumstances, his conduct was rude, and almost insulting.

"I have told you, sir, that it was given to me by my brother, as a keepsake," she replied.

"Hem!" ejaculated Mr. Aston. "It is a costly keepsake for a youth like Master Henry to have bestowed. I should have thought he had better have kept the little money he possessed for other purposes. Perhaps, though, he found himself unexpectedly in funds before he sailed?" and as he said this he looked again into the young girl's face.

Mary Talbot felt that this was unpardonably rude and insulting on the part of her visitor, who, though he had shown kindness both to herself and her brother, had no authority to question her relative to their own affairs, or to find fault with their expenditure; and her neck and brow, as well as her cheeks, now flushed—not with shame, but with anger—as she replied—

"I know not, sir, by what right you come here at this hour of the evening to question me about what only concerns Henry and myself. I confess that I needed no *souvenir* to remind me of my brother, and that I thought the gift a costly one. Henry, however, had his own reasons for presenting it to me; and, moreover, he did *not* leave England in such a penniless condition as you appear to imagine. He had more than two hundred pounds in his possession!"

"Two hundred pounds!" ejaculated Mr. Aston.

Mary fancied, from the manner in which he interrupted her speech, that he intended to impugn her veracity.

"I tell you, sir, my brother had two hundred pounds, and more, in his possession when he sailed from Southampton," she went on. "You seem to doubt me. I saw four Bank of England notes for fifty pounds each. My brother himself showed them to me, and these were unchanged when he embarked."

Mr. Aston stood for a moment silent and thoughtful, looking intently into the flushed face of the young governess. Then, as if he had made up his mind how to act, he placed the locket—which, during this brief colloquy, he had retained in his hand—on the table.

"Perhaps I have no right to question you, Miss Talbot," he said. "But I would recommend you to be very careful of your brother's gift. Keep it locked up, and don't expose it to *others* as you have done to *me*, or you may chance to lose it. That might be unpleasant." And with this, without even bidding the young lady good-night, he quitted the room and left the farmhouse.

"Can it be possible that she was an accomplice in the base, cruel act of plunder?" he asked himself, as he journeyed homeward, his thoughts so much occupied with what he had so unexpectedly seen and heard, that he had, for the time being, altogether forgotten the object with which he had hastened to the farmhouse immediately on his return from Falmouth. "How, otherwise, could he have accounted to her for the sudden possession of so much money?"

He was now perfectly convinced in his own mind that Henry Talbot had basely taken advantage of the sudden attack of illness with which he had been seized, to rob him of the money which he had expressly drawn

from his banker, and had that morning placed in his pocket-book as a parting gift to the young man himself. Whatever doubts he had hitherto had—whatever determinations he had made since he had heard of the loss of the Amazon, to banish his former doubts—all now passed from his mind. He felt as fully assured of Henry Talbot's guilt as he could have been had he witnessed the act of plunder.

Until now, amidst all his doubts and fears, he had held Mary blameless. An hour earlier he would not have believed it possible that she could be cognisant of the crime, and now he felt satisfied that she was, in one sense, as guilty as her brother.

"What meant the sudden movement from the door to regain possession of the trinket? What meant her evident shame and embarrassment, when, before she could regain it, I had seized it from the table? Why should she be ashamed of a *souvenir* presented to her by her only brother? And why, when driven to bay, did she so passionately stand on her brother's defence before I had accused him of wrong-doing? What could all this mean but that she is a party to the crime?"

These questions, and others of similar purport, Mr. Aston put to himself as he walked homeward; and he now believed that the brother and sister had arranged some plan to account for the possession of the money, in case suspicion should fall upon them. The hardihood in crime that such a course of proceeding implied, especially on Mary's part, shocked and terrified him. It appeared incredible that a young girl, so apparently pure and guileless as she, could be so base.

Then he asked himself what was the right course for him to pursue. He had no thought of exposing either the brother or sister. But was it right on his part to permit Mary to retain her present situation? Was it not his duty to acquaint Mr. Sinclair, who had implicit trust in her, that she was unworthy of that trust? And yet, by so doing, might he not drive her deeper into crime? Perhaps she herself abhorred the crime, yet sought to conceal her brother's guilt; and perhaps, after all—and this he earnestly hoped *was* the case—she believed some story that her brother had trumped up, and was herself really innocent.

If she had not evidently endeavoured to conceal the locket, he would have believed this; and still, Henry might have given her some reason for so doing. He might have told her not to let any one in the village see the keepsake he had given her. Did not she herself confess that she had thought it too costly a gift for one in her brother's position to bestow?

He tried to believe that this was the explanation of her evident trepidation of manner; and thus questioning himself, and mentally replying to his questions, he arrived at Cliff Cottage.

His mind was in a too perturbed condition to permit him to arrange his thoughts, or to decide upon any mode of action that night. The painful news he had heard in the morning; the anxiety he had suffered during his return home from Falmouth with the intention of breaking the sad intelligence to Mary, and then acknowledging his relationship to her, and endeavouring to comfort her in her bereavement; and the painful discovery he had so unexpectedly made on his visit to the farmhouse, which had for the time being driven all other thoughts out of his head, had altogether unnerved him; and as soon as he reached home he went to bed, in hope to find relief from his grief and anxiety in the forgetfulness of sleep.

And poor Mary. He had left her very unhappy. For some minutes after his abrupt departure, the

indignation she felt at his strange conduct overpowered all other feelings. Unless he had been indulging too freely in wine, she could not account for it; but she had never known him to indulge—never heard that he was in the habit of indulging in drink. In vain she sought to conceive any motive that he could have had for his unseasonable visit, unless he had come, as she had at first anticipated, to bring her some news of her brother; and yet he had gone away almost without referring to Henry, except in connection with the keepsake which had so completely absorbed his attention.

She felt annoyed—grievously hurt at his singular behaviour, but it was utterly unaccountable to her; and after a while the anxiety she felt respecting her brother, which Mr. Aston's visit had temporarily banished from her mind, returned with redoubled intensity. She could not help thinking that Mr. Aston knew something respecting Henry that he had not told her. She wondered, again and again, why her brother had not written to her, or whether the ship had been really delayed on her passage. She tried to hope that the latter was the case, and that the *next* mail packet would surely bring her the expected letter and relieve her of her doubts and fears.

At length she rose, and replaced the locket and chain and the precious lock of hair which it contained in the secret drawer of her writing-desk, where she had hitherto kept it; and, having read a chapter from her Bible, and knelt longer than usual at her devotions, and prayed earnestly for support, through whatever trials might be impending over her, she too sought rest.

Neither she nor Mr. Aston, however, found the forgetfulness they sought in sleep come readily to weigh their eyelids down. Painful thoughts long occupied the minds of each, and when slumber came at length, it came laden with troubled dreams, and morning dawned and found them little refreshed.

Some days elapsed before Mr. Aston and Mary Talbot met again. Mr. Aston then came to the schoolroom with the rector and Mr. Sharpe; but though he returned her salute, Mary could not help remarking that he sought to avoid her. His manner was evidently constrained; and yet at times—and this was still more painful and inexplicable to her—she caught his eyes turned towards her with an expression in which—as she fancied—aversion and compassion were singularly blended.

As is too frequently the case in this world, a misconception of the feelings they each entertained towards the other, was to both a source of annoyance, pain, and anxiety. A few words of explanation on either side would not only have sufficed to remove their mutual estrangement, but would have bound them together in the closest bonds of friendship and affection.

The words were not spoken, until one, at least, had endured much suffering which might well have been spared to her.

How often, among those whom we ourselves have known, has a misconception of feelings, or a misconception of motives, separated for years, and sometimes for life, persons and families, who, had they known each other's secret hearts, would have lived in the mutual interchange of the kindest feelings!

STREET TUMBLERS.

In most of the suburbs and outskirts of London, the street tumblers, athletes, acrobats, and performers of feats, both muscular and sleight-of-hand, make their

appearance soon after the spring showers, when warm weather is about setting in. They announce themselves, as Punch and Judy do, by banging a big drum with remarkable emphasis, and accompanying it with just a few bars of an improvised air on the Pandean pipes, intended to wake up the neighbourhood. The appeal is recognised far and wide, and is no sooner heard by that section of humanity who delight in gratuitous amusements, and are always on the look-out for "stray gifts to be seized by whoever shall find," than they are surrounded by a flock of interested spectators, quite ready to appreciate their activity and skill. The performance invariably begins by the ceremonious spreading of a small remnant of stair-carpeting in the centre of the road or open space, an operation which takes up a great deal of time, and seems to be regarded, both by the operator and the lookers-on, as an important and mysterious affair. At the same time, another and far less ceremonious member of the company is engaged in clearing a ring, which he does by swinging a stout rope armed at either end with a heavy ball of brass, with which balls he makes play at the heads and toes of the crowd, and compels them to occupy the position assigned to them. What takes place when the carpet is duly spread and the ring is cleared, will of course depend upon the accomplishments of the members of the company, and their willingness to exhibit them in return for the encouragement they receive. The exhibition proceeds on the excelsior principle, beginning with small things, and going on with greater and still greater as the coppers pour in, until the grand climax of all is reached, and the performance is at an end. But you may note that, as a general rule, the climax never is reached, because the coppery shower never is profuse enough to meet the expectations of the performers, so that an abrupt conclusion is what usually takes place, and the sudden migration of the company to some other spot. Ill-natured spectators, especially those who contribute nothing, are apt to say that the grand climax is all a hoax—that the sword three-quarters of a yard long, which lies on the carpet ready to be swallowed when the coppers amount to three-and-nine, never *is* swallowed at all; or that the small donkey who waits there so quietly ready to go up the ladder, and be balanced on Signor Mokoni's hairy chin, never did go up the ladder in his life, and never will. We don't know anything about that, having ourselves never witnessed a completed performance, owing to the lamentable want of generosity on the part of the populace.

Meanwhile there is no denying that, climax or no climax, a good deal is done. The signor squats like a Turk, and lets fly a number of golden balls which he takes one after another from the pocket of his tinselled jacket, until his head is seen bobbing about beneath an ever-changing dome of the glittering globes, which, as fast as they fall into one open palm, are propelled to the other and sent circling again. Then the balls are changed for a set of gleaming bowie-knives, which are sent on the same rapid circuit, and whose shining points come in fearful proximity to the operator's temples. Then the signor folds his arms and takes breath a little, while a comrade goes through a series of peg-top manoeuvres—spinning the top, whirling it in the air, catching it on his back, on his head, on the nape of his neck, on the sole of his shoe, or wherever else he chooses, and finally, ere it has ceased to spin, balancing it at the end of a long reed, upon his nose. Then you have gymnastics by a couple of youths who, joining hands and feet, roll round the circle so rapidly that one is not to be distinguished from the other; then they separate and turn no end of

somersaults, and walk and run and frolic indifferently on their heels or their heads, or embrace their own necks with their legs, while they hop about like fabulous birds upon the palms of their hands. When the signor has breathed awhile, he lies down on his back, turning the soles of his feet to the sky, and upon them is laid a long pole which he sends flying aloft and catches again as it comes down, keeping up the game to the tune of the big drum and pipes until you have had enough of it. Then the pole is flung off and one of the youths springs upon the upturned sole, where for a time he is pleasantly kicked from one foot to the other, rising higher and higher in the air at each succeeding kick, and finally performing a double somersault in his passage to terra firma. The signor now chooses to get up, but of course he does not do it as an ordinary mortal would; keeping his arms still folded, he prefers to pick himself up without the use of his hands, and he does it by sheer force of muscle. Then you shall see him planted firm on his feet, while a comrade as tall as himself leaps upon his shoulders, where he also stands erect and firm, while one of the youths swarms up the bodies of the two, and, standing on the shoulders of the second man, looks down from a height of some fifteen feet. Thus loaded, the signor walks about with a grand air to a martial tune, indulging his upper storey with a private view into the attics of the surrounding dwellings. After this, if the coppers are forthcoming, you may see some conjuring tricks; and, if you like to participate, you may even assist in their performance. You may have, for instance, a huge padlock taken out of your waistcoat pocket and firmly fastened in your jaw; or, objecting to that sort of dentistry, may see a quart of ale pumped from your elbow; or you may lend your handkerchief to the signor, who, unfolding it before your eyes, will show you that it contains half-a-dozen new-laid eggs. Various other tricks are performed, none of a very recondite kind, such as go to make the reputation of the far-famed wizards who astonish the world of fashion, but clever enough to startle and amuse the populace.

What is the origin of these amusing vagabonds? Where do they all come from when the season for their annual appearance sets in? How do they live? and where do they live in the winter? and what becomes of them when years steal upon them, and feats of activity and strength are out of the question? We shall endeavour to answer these questions *seriatim*. There is no question but that the most accomplished of these out-of-door professors have been trained to the business from infancy, and do but follow the vocation of their sires. This is shown to be the case by the extraordinary pliancy of limb and suppleness of joint which many of them possess and will retain up to middle age. They could never acquire the capability of twisting themselves into the shapes we sometimes see them assume, if they did not begin young, and they only learn it as children by constant and often very painful practice under the direction of their parents, or proprietors—by which latter term we mean to intimate the unpleasant fact that promising children are not unfrequently surrendered by their parents, for a consideration, to trainers who speculate upon making a profit out of them. On the other hand, there are numbers who take to this sort of industry—if industry it can be called—from a real liking to it; while there are also not a few who are driven to it by necessity. Of this last class are the poor street outcasts of London and other great cities, who begin by running and tumbling for halfpence after omnibuses, and end by joining, in the humblest capacity, some wandering

gang of street-strollers, with whom they work their way upwards as they best can.

To account for the appearance of the tumbling fraternity with the advent of summer, we need only revert to the necessities of their lot, which controls, and must control, the routine of their life. Performing their feats, as they are compelled to do, in garments too thin and light to afford them protection against rough weather, it would be madness in them to expose themselves to it, and therefore they never do if they can help it. They have a prudent fear of rheumatism, an attack of which would put an end to their occupation; and you may observe that after their performances they are always careful to cool themselves gradually, and will don cloaks or overcoats against the slightest shower of rain. Up to the time when we see them first in the streets they have been performing under cover—in barns, in dancing-booths, in public-houses, in travelling shows and circuses of small note, in penny theatres, and in migrating caravans, where their feats are of use in supplementing the attractions of a dried crocodile, a fat boy, or a calf with two heads. They take to the road in summer with the view of making a little more money than they can do in such engagements; and they gravitate towards London in the first instance, because the races, which come off at no great distance from London during the summer months, afford the most promising field for their exertions. On the racing downs they sometimes endure enormous labours and fatigue: they have been known to walk from London to Epsom in the early morning, starting before dawn—to be active throughout the whole day, with just an interval during the running of the horses, and at night to bivouack in an extemporised tent, or under the lee of some bank or sheltering wall—and to resume their avocations with unabated vigour on the following day; and so on until the carnival of the race-ground is over.

It is a prevailing notion that this class of men are intemperate and besotted, and spend their gains chiefly in drink. As a rule, nothing can be farther from the fact. A man who was given to drinking would speedily come to the end of his career as a gymnast or tumbler: he would lose firmness of muscle and strength of nerve; would drip with perspiration under exertions which the man in good training would make with perfect coolness; and in the end would be cast off by his comrades in their own self-defence. There are exceptional drunkards, of course, among them, who by strength of constitution last for years, but they come to grief and disgrace sooner or later. The expenses of a travelling company are not, judging from observations we have made, very enormous. There is generally a managing wife among them, who looks to the preparation of breakfast and supper at their quarters for the time being—the midday refreshment of the troop being taken as opportunity may serve. They do not appear to be at all choice, when on their travels, in the matter of lodgings. Some time back, while accompanying an inspector in his survey of a crowded lodging-house, we came upon a small room in which was a single bed; the occupants were a company of street tumblers, to the number of six; two lads occupied the bed, while the other four lay on the ground amidst their properties, all of them being fast locked in slumber, which our rather noisy intrusion failed to disturb.

When autumn comes on, heralding the approach of winter, these professionals begin to look out for some cover in which to hibernate; nor, in these days of popular amusements and recreations of all kinds, have they very far to seek. Many of them return to the

travelling shows, which find their harvest in the fall of the year by attending the mops and statute hirings, and the numerous fairs for the sale of farm produce of all kinds, which then come off. Many more contract engagements with publicans and the proprietors of music halls, where their performances alternate with those of the musical soloists and public singers. Numbers not so well qualified make their appearance on the stage of the "gaffs" and penny theatres in the low districts of the metropolis; while not a few get up independent exhibitions of their own in some poor neighbourhood—their stage being, perhaps, a room in the rear of a huckster's or marine-store-dealer's shop—where a dress-box ticket costs threepence, and pit and gallery are open at proportionate prices. Now and then the street performer gets a winter engagement at one of the London theatres, where he is generally taken on with the express condition that he accepts any kind of "business" it may suit the manager's convenience to assign to him. Hence it comes to pass that playgoers may see the Signor Mokoni blown into the air by the springing of a mine in a war spectacle—swinging by his legs from the sails of the mill in the "Miller and his Men," knocked about as an ancient "Charley" in a farce, or staggering about as decrepit pantaloons in a pantomime.

The most serious question of all, and the saddest to answer, comes last: What becomes of the tumbling professor in his old age? There are few prizes in this department of the lottery of life. The whole of the records of muscular greatness furnish very few Blondins and Leotards, and only one Belzoni: the million failures find no record, because no man cares about them. Old age, or what is tantamount to old age, steals upon the performing athlete much earlier than it does upon ordinary men, simply because an infirmity which would be no bar to the pursuit of ordinary avocations is often fatal to his. A touch of rheumatism, a liability to cramp, the straining of a muscle, the sprain of a sinew—any one of these may lay him on the shelf for a time, and if either should occur when he is past his prime, it is more than probable that he is laid by for ever. Men of this class are never willing to admit that their powers are failing, and often bring about the evil they fear by affecting to despise it. A man who should lie by to recruit, will go on violently exercising himself to avoid the suspicion of infirmity, which would be damaging to him; by-and-by his powers fail him of a sudden; he "misses his tip," as it is termed, that is, he trips or breaks down in performing the exploit which he is advertised for, and unless he can recover himself and perform it on the spot, it is all over with him—the beginning of the end of his career has come. Careful men take all possible pains to stave off this woeful crisis as long as they can: they drink sparingly—they diet themselves—they husband all their strength for the performance of the duties required of them, and resort to bathing, friction, poulticing their joints, and anointing themselves with "nine oils," and various other medicaments and devices for retaining the forces and elasticity of youth, which, last as long as they may, will desert them but all too soon. Many a man, after he is worn out himself, will retain a position in the company to which he is attached, on account of his child or *protégé*, whose clever performances bring money to the concern. In such a case he is seen no more in the arena, but is employed in some other way, as carter, stableman, bill-sticker, or general factotum, doing whatever is to be done for the common good. It is not an unusual thing for the street athlete, when his strength fails him, to turn peripatetic tradesman. If he have saved a little capital, and can

start a horse and cart, he does not make a bad figure as costermonger; and, as such, generally thrives. Wanting the means for such an outfit, he will push at a handcart, or carry about his stock on his head. His greatest enemies in either case are his nomadic habits and love of change, which are apt to interfere with his success, and reduce him to sad straits. Under the most disastrous circumstances, however, you never find him voluntarily resorting to "the house" as a refuge. All his habits and predilections are dead against that. If he is carried thither in his hour of distress and helplessness, it is in all probability to escape from duress by a speedy death.

That the life we have been describing must have special charms for those who follow it there can be no doubt, looking to their evident freedom from care and their customary good spirits, and to the fact that the march of science and the schoolmaster does not appear to diminish their numbers. What these charms are, however, one can hardly declare with certainty. It may be that certain temperaments find their fullest gratification in such a life; and that the admiration and popular applause that follow on success are an ever-present and agreeable stimulus, outweighing its inseparable hardships. Then we must remember there is a chance of a splendid reputation and enormous gains, which any youthful aspirant may hope to attain; and that this possibility, like a hundred-thousand-pound prize in a lottery where thousands venture, though but one can win, cannot fail of its attraction. On the moral bearings of the subject we need not here touch:

THE AGRICULTURAL POPULATION OF INDIA.

BY REV. ROBERT HUNTER, M.A., LATE OF NAGPORE.

INDIA is in the main an agricultural country, and the great mass of its people are more or less directly engaged in the cultivation of the soil. "Happy peasants!" some one may be tempted to exclaim, "who draw from the unreluctant soil of fertile India abundance wherewith to satisfy their wants; who care not for politics, and never trouble themselves to inquire who rules in the imperial palace, or who ceases to rule, feeling that they are too obscure to be worth the notice of a tyrant, and that they may therefore pursue their tranquil course, whatever revolutions may rage in high places, much as the poetess describes:—

'O joyous birds, it hath still been so:
'Through the halls of kings doth the tempest go,
'But the huts of the hamlet lie still and deep,
And the hills o'er their quiet a vigil keep.'

Happy peasants! who find life easy, who have to work for their sustenance at the utmost but a few hours each day, and who, when evening falls, take out their pastoral pipes and play simple melodies with vocal accompaniment, each wooing and winning some village maiden, and then living a happy life with her in a cottage, which he has erected on the most picturesque spot on his fields! Happy even in faith, as living far from the din of religious controversy and yet reaching the truth by a kind of simple instinct, which tells them that gratitude and love are due to the Author of their being, and the Preserver of their lives!" Yes; if all that were true, they would be happy peasants; but nearly every element in this pleasing picture is devoid of verity. Let us sketch the real life of the Indian agricultural population.

It is quite correct that they rarely trouble themselves to ask who their sovereign may happen to be, it being the exception rather than the rule for a traveller to meet

with an inquiring spirit who seeks information on such a matter; and when at any time one is encountered, it is difficult to repress a smile at the simplicity of the questions he puts. Rumour had whispered, even in somewhat remote parts, that this country and its great dependency were ruled over by a lady. It had also alleged that it was governed by a gentleman, and had even ventured to name him Koompanee, or, more fully, Koompanee Jehan—the Company John, or John Company. Here, then, was a perplexity which sorely afflicted the village student of Indian politics. If Jehan, or John, were really the ruler's name, how could it be alleged that India was governed by a lady? If, on the other hand, it was truly asserted that the sovereign was a lady, then what, pray, were the functions of the aforesaid John? Before the political changes consequent on the mutinies had displaced the East India Company from the close connection it so long had held with the administration of India, the difficulty now mentioned was stated to ourselves by an Indian peasant in his native dialect, in the hope that it might be within our power to furnish its solution, the precise question asked being, "Is Koompanee a man or a woman?"

But though the apathy of the Indian agriculturists may prevent their inquiring into the machinery of government, it is by no means correct that troubles in the upper regions of society pass by without affecting them: the very humblest peasant is really interested in the character of the sovereign power, whether he understands it or no. If the supreme ruler be too weak to inspire terror into evil doers, each of them will virtually become a monarch in the district where he happens to live, and not deem even the small peasantry beneath his dishonest attentions. Nor will it be simply property that will be brought into danger, it will be life. Before the British power was firmly established in Central India, and while the responsibility of keeping order there almost entirely devolved on native potentates more or less weak in character, and not often faithfully served, vast districts, not to say provinces, were annually overrun by troops of mounted robbers, called Pindarees, who everywhere swarmed like locusts, their numbers being estimated at from 20,000 to 25,000 horse, "of whom 6,000 or 7,000 were effective cavalry, about 3,000 or 4,000 middling, and the rest bad." When they had plundered districts under native rule, till they were not worth plundering any more, they then made some incursions into the British territory, in one of which, brief in point of duration, there were "killed by them 182; wounded, some severely, 505; and tortured (to make them give up their money), 3,633." "In many places the women, either to avoid pollution or unable to survive the disgrace, threw themselves into wells and perished." In one small town, "where the people, after a desperate defence, were overpowered by their assailants, they set fire to their own dwellings, and perished with their families in the flames."

So far, at least, as Central India is concerned—and we believe it the same throughout the vast Indian peninsula—the agriculturists have from time immemorial lived in villages, no one daring to occupy a house on his farm away from shelter. The writer of this article having travelled, generally on foot, for many hundred miles through Central and Western India, never once saw a farm-house. The arrangement adopted was this: villages were scattered over the country, generally at intervals of one or two miles apart. From these the agriculturists issued forth early in the morning, driving their flocks and herds before them to the fields. There they laboured for a great part of the day, and then

returned similarly attended in the evening. When a traveller approached a village towards sunset, he would see shepherds arriving with their sometimes numerous flocks of sheep and bullocks, trudging along to the general place of rendezvous, sometimes with bells which tinkled pleasantly suspended from their necks. When sheep and cattle were thus collected at the villages, they were safer from the attacks of tigers than if they had been left in the fields; while, if plunderers had appeared, the animals would have had the entire village community ready to rush to their assistance. While the strong arm of British power, under God, so effectively protected the Indian villages, they often forbore to bring home their flocks and herds; and such a scene as that in the vicinity of Bethlehem might easily have been witnessed—shepherds keeping watch over their flocks by night under the open canopy of heaven. In most cases, if there were no one else in the fields, there was at least one person, a watcher, who, taking his station on an elevated erection, saw that no one came stealthily upon the ground to steal, or destroy the crops. Still, this in no way removed the impression produced by the want of farm-houses: the teaching conveyed by that significant fact remained unimpaired. It was unmistakably shown that no such confidence in the continuance of public tranquillity as that which encourages the British farmer to pitch his residence away from the support of his fellows had visited India when the village system was first organised; nay, that it had not fully visited it yet, else would that system have been changed. To render the more important villages defensible against such mounted robbers as the Pindarees, already described, they were in general fortified. We suspect that these arrangements also obtained in ancient Palestine. Hence, while we perpetually read of fenced cities, we do not read of farm-houses, even where we should expect them to be mentioned. Thus, while David spent a great part of his youth some distance out from Bethlehem, where his flock, not to say himself, was exposed to attacks from such animals as the lion and the bear, it is plain, from 1 Samuel xvi, that he and his father Jesse lived not in a farm-house, but within the walls of Bethlehem. Again, while the churlish Nabal sent out his flocks and herds to feed on the half-desert pastures, he sought his own safety within one of the neighbouring towns; and when the prophetic Gog wished to plunder some unprotected people, he did not bethink him of farmers living in detached houses, for such seem not to have existed; but he said: "I will go up to the land of unvalled villages; I will go to them that are at rest, that dwell safely, all of them dwelling without walls, and having neither bars nor gates, to take a spoil and to take a prey; to turn thine hand upon the desolate places that are now inhabited, and upon the people that are gathered out of the nations which have gotten cattle and goods, that dwell in the midst of the land" (Ezekiel xxxviii, 11, 12.) In India the smaller villages are unvalled, as Gog was to find those of Canaan, while there is another resemblance between the two cases. Overpowering the inhabitants of the smaller villages, an invader would find a great booty in the assemblage of flocks and herds which had been driven at nightfall to seek such protection as the proximity of so small a number of human beings could afford.

All the more important Indian villages are provided with defences. Very generally they are surrounded by a wall, and have besides a small fort at one angle of the enclosure. In the Crimean war it fell upon our officers, with something of the novelty of a revelation, that earthworks, such as those that the Russians hastily

GRAIN SELLERS.

(From a Photograph.)

threw up before Sebastopol, were in many cases more, and not less formidable to a foe, than elaborately constructed stone fortifications. This secret in military science appears to have been known in India from the remotest period of antiquity, and the material used for the walls of the ordinary villages, and for their citadels, the small forts, is in general mud. In some cases brick is employed, and in others stone. We felt proud of our Government in the East, when, in the years preceding the mutinies, we saw one fort after another allowed to fall into decay. The most notable case of this kind left traces in the memory. There is a kind of fig-tree in the East, called the "peepul," which has a habit of sending its branches through small holes in walls, if it does not even make them for the purpose where they did not exist before. We have seen a flourishing branch thus present itself inside a gentleman's house, at the foot of his staircase, where he allowed it for a time to continue, on account of the interest attaching to the unwonted spectacle; but he dared not have permitted it to remain long, otherwise it would first have split his wall and then broken it down. In a town we once visited there was a brick fort, which must have cost a considerable sum of money to rear it; but a peepul tree had either found or made a hole in the wall, and poked through it a slender twig, which in due time had grown to be a great branch. Already it had cracked the wall in various directions, and, unless speedily removed, was on the same road towards flinging it over. On looking at the suggestive spectacle, we could not help reasoning in such a manner as this: The state of that wall shows the confidence the people of this town have in the ability of our Government to keep public tranquillity in the East. If the arm of British power were paralysed, it would not be long before it would be found requisite to cut down, or at least maim that destructive tree, and put the fort wall in a state to resist the attack of the new Pindarees who would soon swarm over the land.

In our fancy picture we spoke of each one wooing and winning a village maiden. In reality there is no wooing in the case. A boy and girl are betrothed to each other in early life, probably before they have ever spoken to each other, and while there is no possibility of knowing whether they will ever contract a love for each other or not. In due time betrothal is followed by marriage—marriage, which, in the whole of India, has a fatal tendency to lay the foundation for the financial ruin of at least one of the families connected with it. The reason is this: Most of the Hindoos are poor, and they are improvident. When the time for the marriage of a son or a daughter comes, it is found that no saving of money to meet the inevitable expenses has been made previously. Then fashion, which is more galling among the Hindoos than among ourselves, has prescribed that the marriage expenses shall be on a scale so disproportioned to the means possessed by either of the contracting parties, that they cannot be met without incurring debt almost hopeless in amount. If one had a salary of seven rupees a month (eighty-four rupees a year), custom prescribed that he should expend about one hundred rupees each time that a son of his was married. If a curate in this country, with a salary of £84 a year, and with six sons, were to find it impossible to give one of them in marriage unless £100 were spent on the occasion (chiefly in revelry), the absurdity would not be greater than what we daily see in India; and the agricultural population being very far behind, intellectually, never make the smallest effort to break the galling yoke. So, when some farmer's son

has to be married, the worthy father makes a point of acting in a manner befitting his rank, by spending more than a year's income in celebrating the happy event. But where does he get the money? By mortgaging the produce of his fields, ere yet these fields are sown, to the money-lender, who is not some gentlemanly individual from an Eastern Lombard Street, averse to pressing too far on a person in pecuniary distress, but a heartless screw, whose smallest demand is for 33 per cent. compound interest, and who quite as frequently makes it 66. When this is paid in farm produce, instead of in money, which, probably, is the case, the astute money-lender is found a faithful observer of that precept which teaches the propriety of buying in the cheapest market, with the view of selling in the dearest; and we would venture to allege that the grain-selling, represented in the wood-cut, will put no money into the pocket (so called) of Ramchundru Gopal, small farmer near the village of Bhooree. The proceeds of the sale will be paid over to Omichund, banker, money-lender, corn-factor, etc., etc., an enterprising individual, who first appeared in these parts from his native land, Marwar, in the north-west of India, carrying five rupees (equivalent to ten shillings sterling), tied up in the end of his scarf, and, commencing first as a money-changer, went on till he became banker, grain-merchant, and general speculator, with such funds at his command as to render him quite the Rothschild of the province in which he has taken up his abode. One great service which missionaries render to their Indian converts is to enact that expensive ceremony shall be discarded at all native Christian marriages, and that five or at most ten, instead of one hundred rupees, shall be the utmost extent of the charges incurred.

In the fancy picture, again, it was assumed that the simplicity of the villagers would lead them instinctively to the more obvious ideas underlying natural religion. Alas! experience dissipates this vain imagination. If the world by wisdom knew not God, and the highest intellect and knowledge ever possessed by the ancient sages were insufficient to enable them to reach true, however inadequate, conceptions of the Divinity; much less are the gross ignorance and the unawakened intellect of the Indian agricultural population fitted to bring them near to God. One of the commonest objects of worship among the villagers consists simply of the heaps of stones gathered from the fields, to render the latter fitter for agricultural operations. These stones are smeared with red lead, which is especially stuck on the projecting angles of the several stones. The aspect they then present is very much what would be exhibited if one were to stick pellets of red clay on the angular points of the stones heaped together at the corners of one of our own fields. They call that god Mhussoba, and, as might be expected, he is not a beneficent but a malevolent being, worshipped from fear and not from love.

Notwithstanding all, there is much to excite affection for the Indian cultivators. Though not intellectual naturally, and though what little understanding they have has been allowed to remain fallow—it being quite an exceptional case to find one of them able to read fluently—yet they are more loveable in some respects than the Brahmins, for they are more honest and trustworthy. Many of them, too, are hardworking men; and there are parts of Central India where, when the grain crops were in blade, far as the eye could reach we could see nothing but one continuous sheet of emerald green. At other parts there was a greater variety of hue. Thus, one noting the plants cultivated has to make such

entries as this in his journal—"Village of Assolee—near it were fields of wheat, pigeon pea and millet. Mahalgau—the fields onward from this village were of wheat, millet, and more rarely of pepper, sweet potatoes, etc. (By sweet potatoes is not meant a particular variety of our own potato, which belongs to the nightshade family of plants, but a kind of *convolvulus* whose tubers are eatable.) Waroda village—near this, plantations of plantains occur."

The intellectual state of the people resident in these villages may be inferred when it is stated that in the first of them, a place of about fifty houses, there was no school, and no person old or young could read; while in the second, of eighty houses, one was that of a rain-maker (!); and in the last, a small town of 300 houses, the rain-makers occupied three dwellings.

From these facts—and they might easily be multiplied a hundred fold—it is painfully apparent how much the Indian villagers require to be taught at least the rudiments of education, and, above all, how much they need to be instructed in the doctrines and precepts of our holy faith. In social matters, no reform is more urgent than one which shall reduce the crushing weight of marriage expenses, as now imposed by foolish and tyrannical custom, and emancipate the unhappy victims from the bondage in which they are held by the money-lenders: to whom they have mortgaged the produce of their lands.

The agricultural resources of India are so vast that, with proper management, it might not merely support its own population, but furnish in addition supplies of one kind of grain or other to feed a great portion of mankind. All that is needful to effect this desirable result is simply to provide some apparatus for utilising the water, which falls in torrents from the sky at certain seasons, and escapes away to the ocean without having been made to render man the service it might have been expected to furnish. Let India be properly irrigated, and we shall no longer have our feelings harrowed by reports of famines in that land. At the same time, let us not shut our eyes to the fact that the difficulties which have to be overcome are considerable. If our London Government ruled over all Europe, with the exception of Russia and Turkey, and if the vast population over which its authority extended were the reverse of public-spirited, so that, in every emergency their first thought was not of putting forth their individual exertions, but of asking the Government to lead the way in action, the position would in some respects be analogous to that we at present occupy in the East. One might be ready to say, the way to stop famines from occurring is easy. Construct upon the Thames a vast network of channels for transmitting water to the country through which the river passes, and build across it a very powerful embankment, to furnish such a fresh-water lake as may feed the channels. Do the same upon the Clyde and the Tay, and the Humber and the Severn, on the Seine, also, and on the Loire, and the Tagus and the Rhine and the Rhone. Let an identical system be pursued with the Po and the Tiber, with the Elbe also, and the Oder and the Vistula, as well as with the upper part of the Danube. Then may you laugh at famines, even if rain from heaven should in great measure be withheld. Very well, one might reply; but it is to be presumed that operations so extensive would cost a great many millions of money. A government which does not always find its ordinary expenditure met by its income, can only raise money by imposing new taxes, or by borrowing, both of which expedients it wishes if possible to avoid. Let its intentions be ever so beneficent, you must give it time to

carry them into effect. The opening of the Ganges canal some years ago was a proud triumph; while the hearty good will with which the Indian authorities have laboured for years on the lower portion of the Godavery, partly to render that river more navigable, partly to construct expensive works with the view of promoting irrigation, gives solid ground for believing that, if time be granted them, they will yet utilise to the fullest extent all the great Indian rivers, and ultimately succeed in preventing the recurrence of those famines which from time immemorial have desolated portions of the glorious Indian land.

M. ROUHER.

It is impossible to read the French political news in any daily or weekly journal without constantly meeting with the name of Monsieur Rouher, now one of the most prominent and influential statesmen in France.

The career of this minister of Napoleon III shows how success may often be ascribed to the unforeseen and trivial circumstances, from which no one would have anticipated any result. M. Rouher was first known, and then became celebrated, by an incautious expression which escaped his lips in the heat of debate, and to which, in cooler blood, he in vain tried to restore its real meaning. His descendants should, out of gratitude, inscribe the word "*catastrophe*" on their coat of arms, for it was this word which changed the unknown advocate, the most obscure member of a mediocre ministry, to his own surprise, into a great public celebrity.

Eugène Rouher, the Senator, Minister of State and of Finance, is now fifty-four years of age, and springs from a family, members of which for the last fifty years have held judicial offices. After finishing his studies at the college of his native town, Riom, he went to study law at Paris, became an advocate in 1837, and established himself as such in 1840 at Riom. The department of Puy de Dôme, or Auvergne, as that part of the country was formerly called, has always been very monarchical and conservative, although during the reign of Louis Philippe, the most violent opposition newspapers, supported by money from Paris, were published there. Consequently, actions against the press were quite the order of the day, and the Opposition, who were desirous of winning to their ranks the young and tolerably wealthy advocate, entrusted to him, directly after he had settled in the department, a large number of these cases to defend. As a barrister, he had not eloquence. He was not a ready speaker, was unacquainted with brilliant metaphors, and his variations on the word "*liberty*," then so much in fashion, showed the timid *dilettante*, rather than the skilled professor, in these press prosecutions.

However, he was thoroughly successful. These trials brought his real judicial knowledge to light. He earned a great deal of money; and, in the year 1843, he married the daughter of the Mayor of Clermont, the chief town of the province, and through this marriage became a considerable landowner. Then he completely broke the loose bands which tied him to the liberal party; and in 1846 boldly came forward as government candidate, at the elections for the Chamber of Deputies, under the patronage of the minister, M. Guizot. But the bitter feeling against one who was considered to be a renegade was so great, that even many conservatives voted against him, and he obtained only a few thousand votes.

Under the Republic, with universal suffrage, he was

more fortunate: 42,000 electors named him as deputy to the Constituent Assembly; and when this body had finished its labours, during which M. Rouher always voted with the Right, 52,000 voters sent him to the Legislative Assembly.

The deputy of the department of the Loire, Citizen Louis Napoleon Bonaparte, had once heard his young colleague, Rouher, speak in the Constituent Assembly, and when asked his opinion on the talents of the speaker, he replied, shaking his head: "It seems to me as if this citizen did not possess the capability of rightly expressing his own thoughts."

No one understood this oracular sentence: they turned away with a shrug from the deputy with the languid countenance, weary eyes, and world-renowned name. Six months after M. Rouher was Minister of Justice. He had never exchanged a word with the then President of the Republic, and was utterly astonished when the President of the Council of Ministers, M. Ferdinand Barrot, informed him that it was the express wish of the first magistrate of the Republic that he should accept a portfolio. Till 1851 he remained under several ministries at the head of the department of Justice.

It was at this period that he let fall that celebrated word, to which we have before alluded, and which made Rouher known from one end of France to the other. On the morning before one of those important sittings, which during the second Republic often became so stormy, Louis Napoleon said to Rouher—

"They wish again to try to extinguish you with the glorious Revolution of the 24th February, 1848. The people really believe that they were all Mirabeaus or Dantons! We must for once hold a mirror up before them, in which they may be able to see a faithful likeness of themselves in all their littleness!"

Rouher, meditating on these words of the President, went to the Assembly, and it so happened that immediately after his entrance he had to ascend the Tribune to answer an interpellation as Minister of Justice.

"Be cautious—the chamber is very much excited to-day!" his colleague Baroche said to him.

"Certainly, certainly," he replied, rather absently, ascended the Tribune, and replied in a few impetuous words to the interpellation. The murmurs of the Assembly excited him still more; and when at last he heard the cry from the Left, "That was just what was said before the 24th February," his presence of mind completely forsook him, and, still under the impression which the words of the President of the Republic had made on him, he raised himself up to his full height and exclaimed with a voice of thunder—

"Your boasted Revolution was nothing more than a catastrophe!"

Only those who have been present at a French National Assembly can have the faintest idea of what now happened. Clapping, shrieking, hissing, threats and insults, followed without end! The tumult lasted for more than half-an-hour, and M. Rouher, who had retired to the ministers' bench, might well have feared for some minutes that his person was not secure from violent treatment.

In vain he explained, after quiet had in some measure been restored, that he had used the word "catastrophe" only in the sense of an unforeseen event. It was of no avail: amidst universal hissing "*l'homme à la catastrophe*" was again forced to leave the tribune.

Foreigners cannot understand the deep impression which such scenes make on the public in France. This innocent word flew like wildfire through the land, and became a sort of test by which some showed their hatred

to the Republic, and others the most unbridled fury against the Government. And the man who had provoked this "catastrophe" in such an innocent manner, could scarcely believe his senses when he contemplated this terrible ferment; but he had an opportunity thereby, such as had never before been presented to him, of studying his countrymen. But he had not much time for this: a vote of want of confidence, a few weeks after, caused the fall of the entire ministry and led to the *coup d'état*. Rouher remained in the chamber as a simple deputy, who could no longer speak, as the Left would not allow him to say a word, and always brought up afresh the recollection of the "catastrophe." At the consultations which preceded the execution of the *coup d'état* at the Elysée, M. de Morny proposed the deputy Rouher as a minister. A dry "No" was the reply of the President, who gave as his reason the following words, which well characterised M. Rouher: "*C'est l'homme des demi-mesures!*"

The new order of things was, however, scarcely established, when the President, now unrestricted in his authority, offered M. Rouher a portfolio, which he accepted; but a few weeks after he retired, together with M. de Morny, as they refused to countersign the decree which confiscated a portion of the property of the Orleans family. How greatly this much-talked-of decree confused the minds of the most faithful and devoted adherents of Napoleon III is proved from the simple fact that Morny, Napoleon's own brother, refused to sign it as minister. Time has cooled down this excitement, and it has been argued also that the word "confiscation" was falsely applied, as three courts of law confirmed that this property did not belong to the Orleans family, but to the State.

Napoleon gave the retiring minister the vice-presidency of the newly-created Council of State, and till 1855 he was almost forgotten, when the Emperor again called him into the ministry, and gave him the portfolio of Agriculture, Trade, and Public Works. Since that time to the present M. Rouher has never left the ministry; and in these twelve years has at different times presided over all the branches of the Government in France, with the exception of War and Marine.

The reader will remember that, after the Italian war, the Emperor, in the year 1859, thought the time had arrived in which a more liberal direction might be given to the Constitution. One of the chief measures taken in this sense was to appoint a minister, whose duty it should be to defend the Government in the chambers. Billault was the first who held this difficult post; and after his death, in 1862, Rouher became his successor.

It was the general opinion that the Emperor had made a mistake in this appointment, as it was well remembered that Rouher's oratorical talents had not shone in the chambers of the Republic, and his "catastrophe" speech was again brought up to the remembrance of the French nation. To succeed Billault, one of the best and most talented orators of France, was not an enviable inheritance for any man. But after his first speeches all saw how greatly they had been deceived. Often has M. Rouher, during the last five years, gained the victory over all opponents. Clever, undoubtedly, as a politician, we must not forget that, as a minister of Napoleon III, his opinions, whatever they may be, have to give way to those of his imperial master, whose will is supreme. Rouher, like all the other ministers, is only the executor of the Imperial will; but, as he is the only one in the whole Cabinet whose gift of eloquence can be employed with advantage in the chamber, a much more important

place in the councils of the sovereign is assigned to him than to any of his colleagues.

In general, the sketch of those official speeches of which we have been speaking is drawn out for him by the Emperor's own hand. He works out the ideas, and then reads the whole to the Emperor; which, after it has been corrected, is communicated to the rest of the ministry. The morning before the sitting Rouher has another audience, when, often at the last moment, not unimportant changes are made. The really marvellous memory of Rouher has grown with all this exercise of mind.

Rouher, in a word, is just the man whom Napoleon III requires—without ambition, without independence, and wonderfully endowed with talents and tact. To have discovered him out of the mass of parliamentary mediocrities, and to have made him pliable to his absolute and inflexible will, is the merit of the Emperor alone.

We must add to this sketch that the private life of Rouher, as well as his personal honour, have never in the remotest degree been subjected to the criticisms of the enemies of the empire.—*From Daheim.*

"OLD WEDGWOOD" WARE.

THE publication of interesting and profusely illustrated biographies of Josiah Wedgwood, by Miss Meteyard and Mr. Jewitt, has given an extraordinary impetus to the collection of the works of that remarkable man. The demand for the earlier productions of the manufactory at Etruria has sharpened the wits of dealers, both honourable and unscrupulous; and as the latter form, alas! an overwhelming majority, a few hints for the guidance and protection of ingenuous and unwary collectors may not be unacceptable.

In the first place, then, it is a duty which every collector owes to himself, to distrust, *primâ facie*, dealers in articles of *virtù*, rare pottery included. This apparently uncharitable dictum is justified by the fact that there is nothing of this kind which perverted ingenuity will not essay to imitate and traffic in, from a Raphael to a scarabæus. It is perfectly notorious to collectors that counterfeit antique furniture, Roman, Greek, and early English coins, Etruscan vases, bronzes of the classic period, implements of the primaaval ages, old Sèvres and Dresden china, and other varieties of pottery, aboriginal weapons, mediæval seals and manuscripts—in fact, everything commanding the fictitious prices paid by collectors, are manufactured on a large scale. The publication of the names and addresses of the people who follow this disreputable calling would be a public duty, were it possible to be sure that the dealers have not sometimes been themselves the dupes of the manufacturers of these wares.

Let it be stated, however, at once, that, in the writer's opinion, the successors of Josiah Wedgwood are quite incapable of knowingly lending themselves to such traffic. Nevertheless, their works, and those of John Adams and Co., of Hanley, who are equally entitled to the benefit of the saving clause, are periodically visited by professed dealers in "Old Wedgwood," and the articles there purchased are afterwards palmed off upon the uninitiated for the almost priceless productions of the Wedgwood and Bentley period. These dealers—mostly Jews—buy up, job lots of ware, which they at once offer unblushingly, and at fabulous prices, as "the genuine article," or else attempt to "doctor" it into a resemblance of the old ware, by a variety of processes little known beyond the craft. For instance, some few years since the

writer went into a pretentious-looking shop in the Strand, and requested to be allowed to examine a pair of jasper flower-pots. The moment he took them into his hand, he knew by a raspy "feel," peculiar to new biscuit pottery, that in all probability they had been in the oven within six months from that time. The assistant volunteered the information, "You have the genuine article there, sir;" and the price demanded was eight guineas. They might have been purchased at Etruria for ten or twelve shillings. Various devices are resorted to to remove this tell-tale asperity of surface; and it is not long since that two Jew dealers, having quarrelled, one of the fraternity disclosed that his rival was in the practice of immersing new goods in a butt of stagnant soft water, trusting to the viscosity of the bath to give them that exquisite smoothness of surface which is one of the most marked characteristics of "Old Wedgwood," but which time alone can impart in perfection.

The greatest windfall for dealers in "Old Wedgwood" happened in this wise. Contemporary with Josiah Wedgwood there lived at Hanley one Elijah Mayer, a persevering and fairly successful copyist of the great master. Much of his ware, in the black basaltes and cane-coloured bodies, was highly meritorious. Elijah Mayer was succeeded by his son Joseph Mayer, an eccentric old gentleman, who died about seven years since worth a round quarter of a million of money. At his death, his executors came into possession of a large quantity of choice pottery, the earlier productions of the house, on which lay undisturbed the dust of half a century; for, although Mr. Mayer had been out of business many years, the remnant of his stock had never been sold. A considerable proportion of this ware was made after original Wedgwood models, of which, however, it fell far short. Scouting their prey from afar, the London dealers in "antiques" swooped down upon this accumulation and bought it up by cratesful. They then removed it to London, and cautiously introduced it into their shops and windows as "Old Wedgwood," frequently obtaining from the inexperienced, for the better specimens, more pounds than they had cost shillings. Many pieces of this ware are stamped "E. Mayer," and this appears to have been a source of perplexity to some of the dealers; but there was one, at least, who found a way to surmount the difficulty, for he told a friend of the writer that this stamp was the name of Wedgwood's designer or manager, and was merely a private mark for the facilitation of business.

One more illustration of the "tricks of trade." Some time since, the art director of one of the leading firms in the Potteries obtained a spoilt copy of a group of figures in parian, for the purpose of making some experiments in colour. The experiments were made, and the group was put aside as worthless; but, before it had been consigned to the "shord-ruck," it caught the eye of a Jew dealer, who either begged it or bought it for an old song. Bringing it up to London, he submitted it to the inspection of a distinguished—one might say illustrious—statesman, who lightens the toils of office, and beguiles the hours of retirement, by indulging in the gentle passion for rare specimens of the potter's art. The dealer represented the group to be a remarkably scarce and valuable piece of Italian pottery of the *cinquecento* period: a fabulous sum was paid for it: rumour says £50. The fortunate possessor, unwilling that such a treasure should be wholly lost to the public, sent it to South Kensington, whence, however, it was ere long ignominiously expelled on being accidentally seen and identified by the modeller.

Lastly, let not the collector of "Old Wedgwood" be beguiled into the purchase of anything which does not bear the impress of that honoured name, nor let him suppose that because an object is so impressed, it was necessarily produced under Wedgwood's personal superintendence, for the chances will be fifty to one that it was not. Nor, again, let him conclude that the presence of the much-desiderated "Wedgwood and Bentley" stamp is an infallible sign of genuineness, for it has happened before now that modern bodies have been attached to old plinths. But let him, if the opportunity present itself of possessing any of these charming relics, and he has not confidence in his own judgment, consult some experienced connoisseur, preferring the risk of being out-bidden to the mortification of burning his own fingers.

JAPANESE POETRY.

Few people have any idea of what Japanese poetry is, or have even thought that there may be poets in that distant quarter of the world. But we have before us a volume of extracts, pretty stanzas, the production not of one poet, but culled from a hundred. The title might run thus: "A Verse from each of the Hundred Poets;" but the original title in literal English is more quaint. It is "One Head (or chapter, verse, stanza) of the Hundred Men;" and these hundred men are emperors, empresses, tycoons, learned monks, warriors, ladies, and others, all of the noble class, whose poetic effusions are collected into a little household book.

Everybody in Japan knows these verses. They have been handed down from father to son for hundreds of years. They are familiar in every household. Some learn to know them by hearing others repeat them, and others by studying the ancient language in which they are written. Japanese is of so flexible a nature that there is no difficulty in forming beautiful epithets for their sacred mountains, or streams, or woods and dells, when they wish to embody their thoughts in verse.

The first verse reminds us of that illustrious Irish cabin, which was open to the sky, where one of our own heroes first saw the day. The Emperor Tengee, which means "heavenly wisdom"—(all Oriental names are significant)—describes somebody's experience of autumnal dew, thus:—

My lowly hut is thatched with straw
From fields where rice-sheaves frequent stand.
Now, autumn's harvest well-nigh o'er,
Collected by my toiling hand,
Through tatter'd roof the sky I view,
My clothes are wet with falling dew.*

A certain supervisor of shipping coming from China to Japan gets wealth, and this excites envy, whereupon he is banished to the "eighty islands," whence he sends this verse to his friend:—

Ye fishermen, who range the sea
In many a bark, I pray ye tell
My fellow-villagers of me—
How that far o'er vast ocean's swell,
In vessel frail
Towards Yasoshima I sail.

The emperor afterwards discovers his innocence, and restores him to his former rank.

The Japanese greatly admire the maple, as its leaves turn red in autumn, and in many of these verses it is mentioned:—

For 'mid the hills the momiji
Is trampled down 'neath hoof of deer,
Whose plaintive cries continually
Are heard both far and near;
My shivering frame
Now autumn's piercing chills doth blame.
The redd'ning leaves of th' momiji
That on Ogura's summit grow,
How pleasant 'tis their tints to see!
Ah! did they but their beauty know,
They would linger till there pass'd again
Our Emperor's miyuki* train.

On the seventh night of the seventh month, which is a festival among the Japanese, ravens are supposed to fly towards two particular stars in the milky way, and the appearance they present in dense flocks as they sail along is said to resemble a bridge. In the royal park there is also a bridge called the "Raven Bridge." The poet puts these two ideas together in the following stanza, which has probably suffered in translation:—

Upon the bridge where ravens, aye,
Do love to pass where hoar-frost's sheen,
When hoar-frost's glittering film is seen;
I trow the break of day is nigh.

In the twelfth ode we have a beautiful figure used. The Goddess Otome, said by the poet to be borne along in the clouds, is taken for the dancing girl at the festival, where he catches but a glimpse of her as she moves rapidly in the throng:—

In fitful path across the sky,
By various winds of heaven forced,
Cloud-borne Otome glideth by—
Now hath the breeze its vigour lost
An instant, and her form so bright
For a fleeting moment greets my sight.

The Japanese poet views the moon much in the same spirit as we of the western world do, as the following verses by different authors testify:—

How oft my glance upon the moon hath dwelt,
Her secret power my soul subdued—
Her sadd'ning influence I alone have felt,
Though all men autumn's moon have viewed.

On every side the vaulted sky
I view: now will the moon have peered,
I trow, above Mikasa high
In Kasuga's far-off land upreared.

The †Ariake-moonbeams will
In th' morning heaven linger still;
While I from thee—how hard the smart—
By Akadski compelled, must part.

A famous soldier in the wars with Corea, who penned the following lines, must have possessed the true poetic spirit. He refers to the blossoms of the *sakura* tree, which wither about the end of the spring.

'Tis a pleasant day of merry spring,
No bitter frosts are threatening,
No storm-winds blow, no rain-clouds low'r,
The sun shines bright on high,
Yet thou, poor trembling little flow'r,
Dost fade away and die.

The autumnal gale, and the dew-drops and withered leaves dispersed by it are noticed here—

Now dew-drops sparkling o'er the moor are seen,
The autumn gust sweeps howling by,
Scarce lurks an instant 'mid the reeds I ween:
In timid show'r the dew-drops fly,
And, scattered o'er the grass, there lie.

Now autumn's gales, in various freak,
On herb, on tree, destruction wreak,
And wildest roar
The gusts that down from Mube pour.

The winds of autumn have amassed
Dried withered leaves in ruddy heaps,
Have them in th' mountain-torrent cast,
Whose stream in stony channel sweeps;
Amid the rocks that bar the way
The mom'ji's reddened leaves delay.

* These metrical translations are from "Japanese Odes," by F. V. Dickins, M.B. Smith, Elder, and Co., London.

* A *miyuki* means a royal progress.

† *Ariake* means the moon shining all night. *Akadski* means the dawn.

The poet here refers to the wild mountain districts of Shigayama.

The following verse is by the son of an emperor, who had become a recluse, and who lived in a hut by a pass in the mountains. Having seen the vanity of the world, on becoming blind he turns poet, and here praises the expression *ausaka* gate, which is the barrier where all meet and all pass by; *ausaka* meaning "place of meeting."

Some hence towards the city haste,
Some from the city here speed by,
Here friends and strangers meet and part,
With kindly glance and careless eye;
Apt is the name it seems to me,
Ausaka gate, men give to thee.

The tender passion is frequently referred to in Japanese stanzas, and in the following ode the course of love is compared to the fishers' barks with their rudders lost:—

The fishers' barks in safety glide
O'er th' broad expanse of Yura's bay;
Their rudder lost, o'er Yura's tide
In vague uncertain path they stray:
The course of love doth, too,
A like uncertain path pursue.

In another verse the flames of love are ludicrously compared to the writhing of the flesh under the *moxa*, a process much used by the Japanese for cauterising.

To tell thee of my love were vain,
Its depth to me is scarcely known:
As writhes the flesh 'neath *moxa's* pain,
The *moxa* on Ibuki grown,
So madly writhes my spirit 'mong
Love's flames, ere now unknown, sore wrung.

In the eighty-ninth ode the poet looks upon the "secret" of her love being known as the most dire calamity, and wishes that the thread of her life might snap ere this should happen. It is by a princess-poet:—

Of my life or soon or late the thread,
The withering thread, perforce must snap:
I almost would 'twere now; I read,
(Of longer life the certain hap),
The secret of our love displayed,
And all our happiness low laid.

The following would do for the lovers of Izaak Walton's "gentle art":—

O that throughout an endless life
I might in peace dwell, far from strife!
For ever watch the fishing yawl,
And view the net's abundant haul:
How fair to me,
How pleasant such a lot would be!

The vast extent of the ocean is neatly expressed in this ode:—

In fisher's bark I onward glide
O'er th' broad expanse of ocean's tide,
And towards th' horizon when I turn
My glance I scarcely can discern
Where the white-tipped billows end,
That with the cloud-horizon blend.

Most of these stanzas contain common and simple ideas, with little depth of thought or fertility of invention. Their chief novelty or interest lies in the allusions to national customs or local scenery. Whatever varieties appear in the poetry and legends of different nations and races, human nature is one and invariable all the world over. Strange diversities are found in the outside of this and the other people, but the inside of man has as much sameness in the mental and moral as in the physical being. The joys and sorrows, the passions and feelings, the appetites and aims, are wonderfully alike in England and in Japan.

Varieties.

APRIL.—April is a month of proverbial fickleness. Sunshine and shower so quickly chase each other in and out of rainbows, that the weather might form a fresh subject for remark every hour. It is all variable and inconstant; so that Shakspeare aptly compares the spring of love to "the uncertain glory of an April day." Tennyson dethrones April from its first place as a noun, and uses it much as he uses the word "Eden" when speaking of the nightingale's song as ringing "Eden through the budded quicks;" for, when he tells of the bride about to leave her old familiar home for the new untried one, he beautifully says, that the doubts and soft regrets that come "Make April of her tender eyes." A like idea had occurred to Shakspeare; for, when Octavia is parting from her brother Cæsar, her husband, Antony, says—

"The April's in her eyes: it is love's Spring,
And these the showers to bring it on."

The variable character of April is also expressed by Tennyson, in "The Vision of Sin," where, again using the word as an adjective, he says:—

"Tell me tales of thy first love—
April hopes, the fools of chance."

It was Rosalind who pertly said, "Men are April when they woo, December when they wed." But if April is a watery month, we may call to mind for our comfort the old proverb that says, "April showers bring forth May flowers."

INTERNATIONAL LAW.—States or bodies politic are to be considered as moral persons, having a public will, capable and free to do right and wrong, inasmuch as they are collections of individuals, each of whom carries into the service of the community the same binding law of morality and religion which ought to control his conduct in private life. The law of nations consists of general principles of right and justice equally suited to the government of individuals in a state of natural equality, and to the relations and conduct of nations, and of a code of conventional or positive laws. In the absence of these latter regulations, the intercourse and conduct of nations are to be governed by principles fairly to be deduced from the rights and duties of nations and the nature of moral obligation; and we have the authority of lawyers of antiquity, and some of the first masters in the modern school of public law, for placing the moral obligation of nations and of individuals on similar grounds, and for considering individual and national morality as parts of one and the same science.—*Chancellor Kent*.

AMERICAN COINS.—At a recent sale in New York of silver coins of the United States, a quarter dollar of 1823, very rare, there having been not more than a score, probably, ever put into circulation, sold for 47dols. 50c. A dime of 1842, very fine impression, brought 25dols. Of the half-dimes, that of 1794 brought 10dols., and others from that date to 1801 brought from 3dols. 25c. to 3dols. 60c. each. The half-dime of 1802, which is said to be more rare than any other coin in the American silver series, there being but three specimens known, was bought for 45dols. Large prices were paid for other coins, of which the largest was for the silver dollar of 1804, which was purchased for 750dols.

INFANT PRAYER.—The following communication, addressed to the Editor of the "Sunday at Home," treats of matters artistic rather than devotional, and may therefore find more fitting place in the "Leisure Hour."—"I was pleased to see, in the 'Sunday at Home' for February, a wood-cut copy of the engraving of 'Infant Prayer.' It may, probably, add to the interest in this picture, to mention that the two children therein represented are portraits. The original, by J. Sant, R.A., was exhibited at the Royal Academy, 1856; its number in the catalogue was 67, and its title, 'The Lady Edith Campbell and the Lord George Campbell, children of his Grace the Duke of Argyll.' I may here quote the criticism of the 'Art Journal' (p. 163) on this picture: 'The two children are grouped as at prayers, and wearing their night-dresses, with an expression of feeling eloquently devotional. The treatment is very simple: the light group tells against the dark background. The picture is absolutely delicious; the children are exceedingly beautiful; they belong to Nature as much as to the Duke.' Their mother inherited her queenly beauty from her mother the Duchess (Dowager) of Sutherland. The engraving from the picture entitled 'Prayer,' was from the *burin* of Henry Cousins, and was published by Messrs. Graves, October 24th, 1857. A fine early impression hangs before me as I write this;

it is undoubtedly one of the best specimens of the effective 'mixed' style of engraving that have been produced, even by Mr. Cousins. In the engraving (but omitted in the wood-cut) a child's crib is indistinctly seen behind the two figures, the head of the crib being ornamented by two carved heads of cherubs. This fanciful method of treating children's portraits, as shown in this picture, is usually adopted by Mr. Sant, and with the greatest success. In the naturalness, grace, and high-bred style that he imparts to his figures of children, he rivals Reynolds and Lawrence at their best. The excellent coloured print of 'Red Riding Hood'—also said to be a portrait—issued by the proprietors of the 'Illustrated London News,' has carried a favourable specimen of his talent in child-portraiture into thousands of homes in all parts of the world; and your wood-cut of 'Infant Prayer' will be, to as many thousands, a still further proof of this artist's skill in treating his pictures of the children of the nobility, in a manner to secure for them a wide popularity among all classes. In the Royal Academy Exhibition of 1855, Mr. Sant exhibited a very pleasing picture of two children, a boy and girl, busily engaged in feeding a bird, only the shadow of which is seen in the painting. These were portraits of the Lord Almaric Athelstane Spencer Churchill, and the Lady Clementine Spencer Churchill, children of the Duchess of Marlborough. In the picture gallery at Blenheim is another child-portrait picture by Sant, representing a little boy kneeling on one knee, and playing the lover to a very demure-looking little maiden, seated on a garden-bank, both being dressed in the quaintest fashion of the past century. Under the title of 'The Inexorable,' this picture was exhibited at the British Institution, 1849. Since that date there was another picture by the same artist, where the little girl was being pushed along in a sledge by the boy lover. Mr. Sant appears to scorn the conventional in portrait-painting, and that he does so with the greatest success, the charming picture of 'Infant Prayer' is a proof."—*Cuthbert Bede*.

EXPERIMENTS WITH POTATOES.—A correspondent writes from Saltash, giving the results of his experience for comparison with the statements which appeared on this subject in the "Leisure Hour" for October:—"I quite approve of changing the seed frequently, and prefer the new ashleaf for garden culture to any other, both as to quantity and quality. I pick out moderate-sized well-shaped potatoes for seed in October, then place them in single layers on dry shelves, with their eyes uppermost, exposed to the light, which no doubt tends to draw off the excess of moisture, and they shoot out green sprouts by March two or three inches long. The first or second week in March I dibble them into a well-prepared piece of ground—sandy or soot tends to pulverize the soil—and for early planting I prefer half a load of stable dung, and three pounds of Peruvian guano to be well mixed with the soil; if the ground is wet and heavy it will be better to defer planting until it is in proper condition. I consider earthing up the potatoes at the commencement of the season very useful, as it protects the haulms from the frost; and in the month of July, when it is most luxuriant in its growth, it acts as a gutter or filter to carry off any excess of rain that may fall in a wet season, besides making a current of air to pass between the rows, which causes it to evaporate and dry off much quicker than it would on an even surface; of course the rows ought to be planted up and down the declivity of a garden or field, and not across it, as is too commonly the case. I imagine the disease is mainly caused by slugs, and other insects, eating the rind of the haulm, which prevents the sap returning to nourish the potatoes as quickly as it otherwise would. On first noticing the disease in the leaf, I have tried the plan of partially cutting the haulm; also of cutting them down an inch below the surface; likewise pulling them up from the tubers. I prefer the second course, but would advise some slaked lime being strewn over the rows, in the evening, to destroy the slugs, and then earth up the rows to a sharp point. The potatoes afterwards ripen nicely, and are very mealy and excellent in quality; but they do not attain their full size, being nearly a third deficient."

LONDON HOUSES.—London bricks are reduced to dry clay again in the course of sixty years, or sooner. Bricks, burn them rightly, build them faithfully, with mortar faithfully tempered, they will stand, I believe, barring earthquakes and cannons, for 6,000 years if you like! Etruscan pottery (*baked clay*, but rightly baked), is some 3,000 years of age, and still fresh as an infant. Nothing I know of is more lasting than a well-made brick. We have them here, at the head of this garden (wall once of a manor park), which are in their third or fourth century (Henry VIII's time, I was told), and still per-

fect in every particular. Truly the state of London houses and London house-building, at this time, who shall express how detestable it is, how frightful! For there lies in it not the physical mischief only, but the moral too, which is far more. I have often sadly thought of this. That a fresh human soul should be born in such a place; born in the midst of a concrete mendacity; taught at every moment not to abhor a lie, but to think a lie all proper, the fixed custom and general law of man, and to twine its young affections round that sort of thing! England needs to be rebuilt once every seventy years. Build it once *rightly*; the expense will be, say, fifty per cent. more; but it will stand till the day of judgment. Every seventy years we shall save the expense of building all England over again! Say nine-tenths of the expense—say three-fourths of it (allowing for the changes necessary or permissible in the change of things)—and, in rigorous arithmetic, such is the saving possible to you—lying under your nose there soliciting you to pick it up, by the mere act of behaving like sons of Adam, not like scandalous esurient phantasms and sons of Bel and the Dragon. Here is a thrift of money, if you want money! The money saving would (you can compute in what short length of time) pay your national debt for you, bridge the ocean for you, wipe away your smoky nuisances, your muddy ditto, your miscellaneous ditto, and make the face of England clean again; and all this I reckon as mere zero in comparison with the accompanying improvement to your poor souls, now dead in trespasses and sins, drowned in beer-butts, wine-butts, in gluttonies, slaveries, quackeries, but recalled *then* to blessed life again, and the sight of heaven and earth, instead of payday and Meux and Co.'s entire. Oh, my bewildered brothers, what foul infernal Circe has come over you, and changed you from men—once really rather noble of their kind—into beavers, into hogs and asses, and beasts of the field or the slum! I declare I had rather die.—*Thomas Carlyle*.

[Did it never occur to Mr. Carlyle that builders are not likely to spend money in erecting structures for the benefit of the ground landlords? Into their possession they would fall as the leases expired, with a *sic vos non vobis edificatis*. The cost of building is determined by more practical considerations than the love of "the cheap and nasty," to which the Chelsea sage alone ascribes it.]

SCOTCHMEN IN LONDON.—The number of Scotch in this capital is absurdly overrated. Though London is inhabited by a larger percentage of strangers, or non-natives, than almost any other city in the universe—New York and some American mixtures of cosmopolitan humanity excepted, of course—yet the number of Scotchmen settled here is wonderfully small. Looking again at the official Census returns of 1861, I see it stated that, while only 62 per cent. of the inhabitants of the metropolis were born within its limits, but one per cent. of the mass of strangers was made up of natives of Scotland. The figures are:—Total population of London, 2,383,989; natives of London, 1,741,177; natives of south-eastern counties of England, 222,319; of south midland, 147,132; of eastern counties, 156,592; of south-western, 128,444; of midland counties, 110,801; of Ireland, 106,877; and, finally, natives of Scotland, 35,733. Thus it will be seen that the tendency of the Scotch to go to London is considerably less than the movement in the same direction of the people of any other part of Great Britain and of Ireland. Even foreigners are far more numerous in London than Scotchmen. The Census returns show 47,419 natives of foreign countries, besides 15,389 natives of British colonies—foreigners *de facto*, if not *de jure*. Dividing the inhabitants of London into groups of 10,000, we find that in every such group there are 6,209 natives of the capital—Cockneys *pur sang*, more or less—while 792 are from the south-eastern counties, 524 from the south-midland, 558 from the eastern counties, 458 from the south-western, 381 from Ireland, 223 from foreign and colonial parts, and but 127 from Scotland. Looking to the countries of origin, and taking the figure 1,000 as the population basis, we find that to 1,000 people in Yorkshire there are thirteen Yorkshiremen in London; to 1,000 people in Wales, there are 15 of Welsh birth in London; to 1,000 people in the northern counties, there are 16 northern men by birth in London; but to 1,000 people in Scotland there are not quite 12 Scotchmen in London.—*London Scotsman*.

ROME.—The population of the city in June 1867 amounted to 215,573. Of these 30 are cardinals, 35 bishops, 1,469 priests, and 828 seminarists. The occupants of religious houses number 5,047; 2,832 being monks and 2,215 nuns. The population, according to the above census, had increased 4,872 since June, 1866.

MARY TALBOT MEETS WITH A SAFE ESCORT.

THE MORTONS OF MORTON HALL.

CHAPTER XXIII.—SOMETHING COMES OF VISITING THE SICK,
WHICH THE FOLLOWING CHAPTER WILL EXPLAIN.

NEARLY a month had elapsed since the arrival of the American packet, and another mail was nearly due. Throughout this period the estrangement between Mary Talbot and Mr. Aston had continued unchanged. The latter visited the schools as usual, and was distantly polite whenever he and Mary met. To others, perhaps, the alteration in his manner towards the young governess might not have been remarked; but to Mary her-

self it was apparent in every look and gesture, while it was equally apparent to her that his manner and conversation were constrained, that he was ill at ease with himself, and that he would gladly have come to an explanation with her.

Mary, however, felt that it was from himself, and not from her, that the first step towards an explanation, and perhaps to a reconciliation, was due. Her youth, her sex, and her comparatively humble position, alike precluded her from making the advance movement, and so the estrangement continued.

Mary perhaps have felt it more keenly than

she did—unconscious as she was of any fault on her part—had not her mind been almost entirely occupied with her anxieties respecting her brother. No news of the loss of the Amazon had as yet reached the secluded village, except that received by Mr. Aston by the previous mail-packet; and as he had refrained from breaking the sad intelligence to her who was most deeply interested in it, by consequence of the unexpected discovery he had made on the occasion of his visit to the farmhouse, he had thought it best, for the present, to conceal his knowledge of the sad fate of the ship from his friends at St. David.

The dark foreboding of coming evil already alluded to still oppressed Mary's spirits. She awaited the arrival of the next American packet with an indescribable longing, and at the same time with a dread anxiety that seriously affected her health; that prevented her from sleeping at night, or troubled her slumbers with frightful dreams; and that also prevented her from resting in quietude for a moment during the day—that was, in fact, painfully visible in her every action. This it was that caused the look of pity and compassion with which she so frequently caught Mr. Aston regarding her when he fancied himself unnoticed. It was painful to him to witness her anxiety, and more painful still to watch the bright light gleam from her eyes when sometimes, though rarely, her compassionate friends would succeed in bringing her to hope that the next packet would bring the long-looked-for letter from Henry, and that all her anxieties would be removed—believing, as he did, that that hope would never—never be realised.

One afternoon towards the end of the month, Mary Talbot set forth, after the schools had been dismissed for the day, to visit a little girl who had become a great favourite with her on account of her quickness of intellect and gentle disposition, as well as her interesting features. The little girl, who was an orphan, and who lived with her aged grandmother in a cottage standing at a considerable distance from the village, had suffered from an illness which had brought her almost to death's door; but a change for the better had lately taken place, and at length Doctor Pendriggen had declared her to be in a state of convalescence. Mary had frequently visited the cottage when the little sufferer was unable to recognise her; and now, with almost her first effort of returning consciousness, the child had expressed an earnest desire to see her. The aged grandmother had walked to the village expressly to deliver the poor child's message, and Mary had immediately promised to pay the desired visit.

It had been one of those fresh and breezy days in early spring, when brilliant flashes of sunlight alternate with deep shadow, making of every landscape a succession of pictures; and when Mary set out, the approaching sunset added to the beauty of earth and sky. The road led along the cliffs, whence, on one hand, she saw the broad blue sea far beneath her feet, heaving heavily, and heard the billows break in sullen roar against the rocks; while, on the other hand, the view extended for many a mile across the country, affording a prospect of fertile fields and dark woods, bounded in the far distance by the shadowy outlines of the Welsh mountains.

The fast-flitting clouds, the breezy grass, the rustling of the wind amidst the young spring foliage, and the foam-crested waves, all were emblems of busy life. There was alike motion, and sound, and conflict; and, for the time being, the gloomy forebodings that had so long oppressed her spirits gave way to feelings of hope and trust.

"The dark winter," she thought, "has passed away, and given place to the hope and joy of spring. The dear child who was given over to death has escaped his cold embrace, and, if it please God, will live to requite the love and care of her aged grandmother. Cannot He who hath brought about these bright changes also change my sadness into joy? I will hope and trust that He will do so. At all events, I will not despair while hope remains, and if I have still greater sorrow to bear—if real trouble come upon me—I will trust in Him who is able to give me strength to endure to the end."

Thus reasoning hopefully, she walked on until she reached old Dame Hoolit's cottage, and was gladly welcomed by the old woman, who thanked her for coming, and at her own request at once led her into the little bedroom where the sick child lay.

As Mary passed through the kitchen into the bedroom adjoining, she saw that the old dame had been chatting with a neighbouring gossip, who was still seated near the fire; and it was to escape the weary chatter of the two old women that she had hastened so quickly to the child on her arrival.

She seated herself by the bed-side, kissed her little favourite, and made her happy with a little present she had brought with her, and then entered into conversation with the child, listening patiently to the little stories she had to tell relating to her illness, and answering her numerous questions about her school-fellows. Then, when she had gained the child's confidence, she talked of graver matters, and told her how grateful she ought to feel to God, who had preserved her through her long weary illness, and who would now, there was reason to hope, raise her up from her bed, to live to be a source of comfort and support to her grandmother's declining years. She read from the New Testament the records which tell how Christ raised the sick and dying to life and health, and became so interested in her talk with her favourite little pupil, that she scarcely heard a word of the conversation that was carried on in the adjoining room, though the door stood partly open; and, as both the old women were afflicted with deafness, they naturally conversed in loud and shrill, though somewhat cracked voices.

At length the child began to show symptoms of weariness, and Mary decided to sit quietly by her bed-side until she dropped to sleep, and then, as it was growing late, to return home immediately.

Now, however, the conversation in the outer room became distinctly audible, and presently caught the ear of the young governess, and arrested her earnest attention.

"A goold locket, do 'ee say? An' two hunner poun's i' money!" exclaimed Dame Hoolit, in a tone of wonder and astonishment. "An' a' stull from Muster Aston!" she went on. "Sure, neighbour, thee maun be mista'en? Us ud ha' heerd on't afore now."

"Na, Dame Hoolit," replied the neighbour. "It bean't na mista'ake o' moine, aw tell 'ee. 'Ta' bin kep' secret; but thou knows as moy darter-i'-laa weer one o' ta' nurses oop to Cliff Cottage when Muster Aston weer ill, an' her weer i' th' room wi' Rector an' Doctor Pendriggen when Muster Aston tell't her to bring un his pocket-book from his coat i' th' wardrobe, an' doctor he gi'n her t' key. But t' pocket-book weer gone, an' Muster Aston tuk on terr'ble for a bit. Then Polly weer sent out o' t' room, an', arter a while, his reverence an' doctor came away, and doctor tow'd Polly as Muster Aston knaw'd weer he'd lost his pocket-book, an' t' weer na great matter. But Polly her knaw'd

more nor doctor tellt her. Her had listened at t' key-hole, an' her heerd a' as was said, an' Muster Aston tow'd how t' pocket-book maun ha' been ta'en by t' fisher-lads, a' toime when un had a fit on t' beach. An' they weer afeared as a' weer lost. An' Muster Aston, he wudna ha' ony fuss made about it, 'case he weer afeard t' wrong folk moight be suspekkit."

"An' it ha' ben kep' secret a' this toime, neighbour?"

"Ay, dame. An' tha' maun na say ought about whatten aw ha' tellt 'ee. Polly 'd happen git i' trouble her sen, i' 'tweer knawed as her weer a listenin'. Her never tellt nought o't till t'other day, and then her said it maun go na furdur."

"An' do'ee think t' fisher lads stull th' pocket-book, thysen, neighbour?" inquired Dame Hoolit.

"Happen 'tweer, an' happen 'tweer na," replied the old gossip. "Aw knaw's nowt about it. Happen 'tweer na stull at a'. An' then tha' knaws theer weer other folk beside t' fisher lads as weer 'long wi' Muster Aston on t' beach."

Dame Hoolit must have cautioned her companion against speaking so loud at this point, for the conversation was continued as though the two old women were whispering in each other's ears, and the only words that were subsequently audible came from Dame Hoolit, who replied to some remark of her companion—

"Ay, tha' may trust me, neighbour. Aw's owd enow to keep a still tongue i' my head."

Mary, however, had heard enough, had heard far too much for her own peace of mind. Under other circumstances she would have believed that she had listened to a piece of idle village gossip. Indeed, under other circumstances, she would not have remained to listen, for the little girl had long since fallen asleep, and ere now she would have been far on her journey homeward. But now she felt—she *knew*—the story she had heard was true; and what a terrible explanation it afforded to the mystery that had surrounded Mr. Aston's estranged behaviour towards herself!

All now was clear enough. He had recognised the locket that evening when he visited her at her lodgings, and had naturally questioned her as to the manner in which it had come into her possession.

"But," she asked herself, "is it possible that Henry is guilty of so base a crime?" and her heart responded, "No, he is innocent. There is some dreadful mystery yet to be explained. It cannot be. It is impossible that Henry can be guilty."

She still sat at the bed-side, gazing at the sleeping child; but a feeling of faintness came over her, and she gasped for fresh air. Rising from her seat, she stood for a few moments to gather strength, for her tottering limbs seemed scarcely able to support her weight; and then she silently passed from the bed-room into the kitchen in which the two old gossips were seated.

"'Art 'ee goin' whoam, miss?" said Dame Hoolit. "It do be getting lāte for sure, an' tha' has a long ways to go. Wun't 'ee stop an' tūake a coop o' tea? 'Tis na for sich as we to arx 'ee; but if 'ee wull, aw'll git it ready directly?"

Mary declined the offered refreshment, much as she really needed it. She wished to escape from the cottage, and think over what she had heard; and after the old dame had thanked her for the visit, and she had promised to call again soon, she was permitted to leave without further question.

It was already beginning to grow dark when she staggered, rather than walked, forth from the cottage; but she felt the cool fresh air of the evening revive her, and

hastened to cross the road into the fields, where she would be silent and alone, with nothing to interrupt the current of her thoughts. Her mind was in a state of utter confusion; and as soon as she reached the fields she rested on a low stile, and sought to recollect all that had passed between herself and Henry, at the time when he had given her the locket, and all that had occurred between herself and Mr. Aston on the evening when the latter had visited the farm-house.

She shuddered as by degrees her memory became clear, and she gradually recalled to mind the whole of the circumstances that had occurred, from the moment when her brother, flushed and excited, had rushed into the schoolroom where she had been seated, and had told her of Mr. Aston's sudden illness, until the evening when Mr. Aston himself had turned from her and quitted her room without even wishing her good night.

She would not even now believe in her brother's guilt; yet her own conscience accused him, in spite of herself. The very evidence it brought forward to prove his innocence, turned against him.

Ah! how different were her feelings from what they had been but a short hour before! The hope and trust that had then lightened her bosom of its anxieties had fled, and left nothing in their stead but doubt and dark despair.

The dark forebodings which had oppressed her spirits since her brother's departure were no longer mere forebodings, but stern realities. Dreary and sad enough were her reveries as she sat on the low stile, while the shades of evening were fast gathering around her—typical of the gloom that had overshadowed her soul. Of all the bright hopes that had once stirred her heart there remained nothing but disappointment and dread; and ere she had well entered the threshold of life she had found her path strewn with thorns, and all before her dreary and desolate.

She remembered how her brother had been alone with Mr. Aston when he was struck down with sudden illness, and that he had hastened away, leaving the stricken man to the care of strangers, and had immediately quitted the village and gone to London, and had returned at the expiration of a week, bringing her a gift which resembled the trinket Mr. Aston had lost—at least, so far as she had heard—in every respect. Thus she recalled that, when he had produced the locket, he had told her that he had received as a loan from a friend, of whom she had never before heard him speak, two hundred pounds—the exact sum of money, and in the same form, as the amount which, as she had heard, Mr. Aston had had stolen from him on the beach.

"What am I thinking of? What suspicions am I daring to harbour?" she suddenly exclaimed aloud, starting up as if in terror from her seat. She started again at the sound of her own voice, and looked around her in alarm, as though she fancied some other voice had spoken, and then, gathering courage, she moved on. "In my heart I have dared to accuse my brother," she muttered to herself, as she walked along. "Others, who do not know him as I do may accuse him—have accused him; but I feel—I know that there is some sad mistake, and that poor Henry is innocent of crime."

It was nearly dark by the time Mary had arrived at these conclusions; but the moon had risen, and shed sufficient light to guide her along the path, which now, for a short distance, led through a deep wood. She was about to hasten her steps, not through bodily fear, for crime or outrage were almost utterly unknown at St. David, but she felt a desire to reach home, and arrange

her thoughts in the quietude of her own room, when she fancied that she heard some one brushing through the wood on her right. Now she did naturally feel some alarm, for she was quite alone, and there was not even a cottage within a quarter of a mile from the spot on which she stood. She stopped short and turned towards the spot where she heard the noise, now more distinctly, and evidently drawing nearer to her. Her fears vanished, however, when she perceived by the imperfect light that the intruder upon her solitary path was no other than Mr. Sharpe, the curate of the parish, who now came forth from the wood, and appeared to be as much surprised and startled as herself when he recognised her.

"I hope I have not alarmed you, Miss Talbot?" he said, as he came towards her. "I have been to visit Farmer Danesforth, whose wife is seriously ill, and, having stayed at the farm later than I intended, I struck through the wood to shorten the road home. But I confess," he added, "that I am surprised to meet *you* so far from the village at this late hour?"

"I also have been to visit the sick," replied Mary; and then she explained that she had stayed later than she intended at old Dame Hoolit's.

"Ah! poor little Susan is ill—I remember," replied the curate; "but I think Doctor Pendriggen told me yesterday that there was a change for the better," he added.

"She is much better, and is, I hope, in a fair way of recovery," said Mary; and then, as she and the curate walked on together, she inquired after Farmer Danesforth's wife and other sick persons in the village.

The young curate of St. David has hitherto figured but very slightly in this history. He was, as I have heretofore stated, a studious and somewhat bashful young man, who steadily and unobtrusively performed his appointed duties without attempting to assume a prominent position, and of whom, in consequence, I have had little to say.

Almost from the first day of Mary Talbot's arrival at St. David, however, she had been an object of interest to Mr. Sharpe. He had, of course, heard of her engagement from the rector, some weeks before she arrived; and perhaps the particular interest he had taken in the young lady might have had its origin in the discovery he had made, that she was very much superior to the majority of young persons who are willing to accept the humble position of a village school governess. Be this as it may, he had experienced a strange feeling of satisfaction when he discovered that she was descended from a good family, and was as well-informed and intelligent as she was prepossessing and lady-like in personal appearance. From that moment he did not hesitate to manifest, in his own quiet unobtrusive manner, the interest with which she had inspired him, and the regard and esteem in which he held her. Gradually, as in his frequent visits to the school-rooms, he became accustomed to converse with her, his natural reserve disappeared, and it was not long before his evident partiality became apparent to Mary herself.

Nevertheless, though the young governess was grateful for the interest he took in her, and perhaps flattered by his partiality, she had felt it her duty to hold herself aloof from him as much as possible, and had at length, in her turn, become silent and reserved in his society.

Mr. Sharpe, however, possessed an advantage in his privilege of visiting the schools at any time he chose. He was not disconcerted by her reserve. On the contrary, he appeared rather pleased with it than otherwise, and still continued his attentions towards her; and at

length, soon after Henry Talbot's departure for America, he seized an opportunity, when he and she had met, as they had now met, while returning from visiting the sick, to ask the young governess to share his fortunes and become his wife; and Mary, although she had not positively engaged herself to him, had confessed that he was not utterly indifferent to her. Again and again the curate had repeated his offer, and though Mary had not yet given him a decisive answer, and though their engagement—such as it was—was unknown to, and even unsuspected by, any others than themselves, they were now, in one sense, accepted lovers. Mary, however, had made some conditions, and declared that she would never become his wife until he was in such a position that his marriage with her would be no impediment to his future fortunes.

With this brief explanation of the position in which the young couple stood towards each other on the occasion of the meeting in the wood, above referred to, I will continue my story.

"You will permit me to accompany you as far as your lodging, Miss Talbot?" continued Mr. Sharpe; "for though I believe the people of St. David are too honest and simple-minded to commit robbery or outrage of any description, this is a lonely road for a young lady to pass over after nightfall;" and Mary, having accepted the young clergyman's escort, they passed onwards together.

"You do not seem well to-night," observed Mr. Sharpe, when, on emerging from the shadow of the wood, he remarked his companion's pale face and languid looks. "You are still anxious respecting your brother."

"I *am* anxious, though perhaps I am—I hope and trust I am—alarming myself without cause," replied Mary; "but—but my spirits—" and she broke down without completing the sentence.

The curate became alarmed.

"What is this, Miss Talbot—Mary?" he stammered forth. "You are really ill. What is to be done? We have yet a mile to walk, and I cannot leave you here in darkness while I go to seek assistance."

"There is no occasion. It is nothing," replied Mary. "My nerves are unstrung. The anxiety I have suffered since—since the arrival of the last American packet, has so affected me, that the least trifle now overpowers me. I feel better now. Let us walk on."

"You have walked too far, Miss Talbot, after the duties of the day; and the visit to the sick child has been too much for you."

As they walked on Mary was still thinking of the one absorbing subject. The curate, she had no doubt, was aware of all the particulars relative to the loss of Mr. Aston's pocket-book, and these she was most anxious to learn before she made up her mind what course she herself ought to pursue. She knew not how, unless from him, she could obtain the information she required.

"I feel much better," she went on, after a silence of a few minutes; "and perhaps you will smile at my folly when I tell you what trivial matters (such as the, perhaps, idle gossip of two old women) affect my nerves in my present state of anxiety. While I was sitting in the bedroom with little Susan Hoolit, I heard her grandmother and another old dame conversing respecting a robbery that has taken place in the village, but of which, until to-day, I have never heard a whisper, and it quite upset me. I wonder, if such a robbery actually occurred, that I have not heard something of it. You, no doubt, can tell me whether the old women spoke the truth, or whether they were indulging in idle village gossip."

"A robbery! Of what nature?" inquired the curate.

"They said," continued Mary, hardly able to keep her voice from betraying her own especial interest in the matter, "that Mr. Aston has been robbed of his pocket-book, which contained money to the amount of two hundred pounds, and—other valuables."

"It is true, I am sorry to say, Miss Talbot," replied Mr. Sharpe, "that Mr. Aston has lost, or has been robbed of, a pocket-book which contained the property you speak of. He firmly believes that it was taken from his coat-pocket on the day on which he was suddenly seized with illness on the beach. Mr. Sinclair, Doctor Pendriggen, and myself, however, doubt this. We suspect that he lost, or was robbed of his property during his visit to Falmouth, a day or two before his illness, and that his memory, impaired during his illness, has led him to mistake the date of his loss. We cannot believe in the dishonesty of the village people. But I am astonished to hear that the affair is known abroad. I thought the secret was confined to ourselves."

"The visitor at the cottage was the mother or mother-in-law of the nurse who attended Mr. Aston in his illness," explained Mary. "The nurse, somehow, heard the particulars, and told them to her mother as a secret. It was not intended that I should hear the conversation of the old women. In fact, they are not aware that I did hear it. But why keep so great a loss a secret?"

"Because Mr. Aston does not wish suspicion to rest upon the innocent, as it might do if the robbery were known and the actual thief or thieves could not be discovered. It was Mr. Aston's especial desire that it be kept secret. Mr. Sinclair and Doctor Pendriggen wished to have the matter thoroughly investigated. I suspect, however, if it be revealed as a secret from one person to another, it will not be long before it becomes generally known throughout the village."

"The old dame who spoke of it," continued Mary, "appeared to be quite minute in her details. She said there were four fifty-pound notes in the pocket-book, besides a gold locket, so remarkable in its appearance that it could be immediately recognised."

"There were other moneys besides, and certain valuable letters and papers," replied the curate. "The nurse must have listened at the bed-room door."

"A pocket-book is a strange receptacle in which to keep a locket," said Mary.

"It appears," replied the curate, "that the locket was a family heirloom. It was engraved with Mr. Aston's crest—two stars and two daggers quartered within a shield, which was surmounted by a griffin, and beneath was the family motto in a scroll. Inside the locket, also, there was a miniature painted on ivory, representing some female relative of Mr. Aston's. He says that he regrets the loss of the locket, and the papers the pocket-book contained, more than the money."

By this time Mr. Sharpe and Mary had arrived at the gate of the farm-house.

"Now, Miss Talbot," continued the curate, "you know as much about the robbery as I do; and," he added with a smile, "I must ask *you* to keep the matter a secret, as *you* say the old woman bound Dame Hoolit to secrecy. I *must* say that I *do* think you were foolish to allow such a matter to trouble you. The pocket-book was lost under peculiar circumstances, and I don't imagine we have now any more occasion to fear burglars than we had previous to its loss. There are very few in the parish of St. David who have so much property to lose. I think you may sleep in the confidence of perfect security from robbers, and I suppose I must now wish you good night."

Mary passed into the farm-house, glad to escape, for she felt that she could not have disguised her feelings much longer; and Mr. Sharpe, still very uneasy on her account, returned to his own lodgings.

CHARACTERISTIC LETTERS.

COMMUNICATED BY THE AUTHOR OF "MEN I HAVE KNOWN."

In the "Quarterly Review," January 1868, the leading article, purporting to be a review of Lockhart's *Life of Sir Walter Scott*, is in reality a biographical summary and analysis of that life, and has interested me exceedingly. I do not know who is the writer, but he is one of the very few remaining, who are conversant with the facts and competent to handle the subject. He has done so in a friendly, but just and candid manner. The revival of the subject induces me to group some letters bearing upon Scott together.

SIR WALTER SCOTT.

An old Scottish proverb says, "They are far behind who may not follow;" and though vast is the distance of my following, I cannot help thinking that some special circumstances in a literary life, independently of many years of personal intimacy, have given me opportunities enjoyed by few, of observing the character of my illustrious countryman.

Scott was eleven years my senior. His childhood witnessed the same natural scenery; he preceded me at the same school; I possessed his predilection for early ballad antiquities, and sought them out with boyish interest, among shoemakers, weavers, and aged crones.* I had a little law to study in my youth, which I did not like, and I took to literature. There is something amusing in the great similarity and greater difference; I had no "crutch," and it would have been well for Scott if he had never altered his so much into a staff. Authors, and especially poets, who set to work at making fortunes, are not, therein, of the true-blue blood. They lose literary caste, and too often imperil both fame and worldly prosperity.

Scott was born only three hundred years too late to be the daring chief of a Border clan. His courage and adventurous spirit (what pity the latter was misdirected in our commercial age!) would have honoured the times of the wizard Thomas, and kept Annan and Teviotdale alive to ceaseless issues, far different from those of the Ballantyne press.

Transformed as men are to the time in which they flourish, Scott was ever paramount in modern, as the chiefs of Cessford or Harden were in the olden, days. He would lead, boldly and nobly, but his co-operation was never more than cool, and his following any other leader was out of the question. As a patron none more staunch and energetic could be found; to minor relations he was gentle and complacent, but, where offended or thwarted, "Wha dar meddle wi' me" might have been his motto, if he had not chosen to assume the more classic national "Nemo me impune lacessit." In small matters he was more than courteous. The reviewer says truly, "He would tax his judgment to discover something meritorious in every manuscript submitted to him;" and when I have reasoned with him on this point (which several times involved my own opinions in trouble), his defence was, "They are not sent to me for criticism; if I found fault it would not only procure me

* I believe I retain many scraps still, which are fast passing away from the memory of man and the realms of manuscript.

dislike, but be considered officious, and do the writers no good." Where he was friendly he was friendly indeed; where he took offence, the resentment soon passed away. I once displeased him by some too free remarks on one of his later novels, and he showed it by evading a visit to Abbotsford from my county member Sir Alexander Don and myself; but next winter, in London, he was as cordial as ever, and so continued to the day of his death. I felt some satisfaction in having a sad posthumous revenge, by being one on the sub-committee of management for preserving Abbotsford in the family, and by my zeal adding a considerable amount to the subscription.*

It was in his patronising friendships that the generosity and warm-heartedness of his nature shone most brightly. He spared no pains in accomplishing his object, and the activity of his efforts was only comparable with the prudence of his advice. No poet could be more enthusiastic, no man of the world more circumstantially particular on the score of moral obligations and conduct. He was a true friend to Allan Cunningham, to the Ettrick Shepherd (notwithstanding the occasional outbreaks), to the brothers Ballantyne, and others I could specify, and cherished a magnanimous kindness towards all his brethren of the pen. As Byron said, he had no need to be jealous of any one.

I find it a delicate task to afford even a slight example of his social and personal virtues, as I have essayed to describe them. What follows is the best I can do. A worthy Edinburgh gentleman in the legal profession, but more addicted to the cultivation of a fine taste for literature and the arts, than to dry law, had felt the usual consequence, and fallen into deep embarrassment. He was nearly connected with Scott's familiar circle, and it was deemed advisable for him to seek employment for his talents "in a country new." The annexed is Sir Walter's letter to him:—

DEAR SIR,—I am sorry for the circumstances which oblige you to think of giving up your profession and exchanging your residence, and would think myself very happy if I could be of use to you in doing so to advantage. I have little doubt that if the situation of the editor to the "Courier" should open, you would be able to conduct it with profit to the proprietors and reputation to yourself, as your acquirements in modern languages, and your good sense and readiness in composition, would be called into frequent employment. I should think, also, you possess that tact and knowledge of the world for want of which so many editors are apt to go wrong, though possessed of many brilliant accomplishments. The profession of editor has, perhaps, many requisites unknown to those who have never professed it; but limiting my attestation to the obvious qualities, such as all men know and understand, I would consider it as a very fortunate circumstance to place you at the head of any paper in which I was interested. I am not aware whether I can serve you further, not knowing any of the proprietors; but if it were otherwise I would be happy to do so, and I request, should an opportunity occur, you will without scruple apply to,

Dear Sir,
Your most faithful, humble servant,
WALTER SCOTT.

Abbotsford, 2 October, 1830

Suffice it to note that the editorship of the "Courier" was not open (as rumour had circulated) at the time. William Blackwood and James Ballantyne interested themselves in the same cause; and I was made a party to the commencement of a literary career which began in a distant province, but has been continued with in-

creasing reputation and influence in the great centre of literary activity ever since. Scott was highly gratified by this success.

JAMES BALLANTYNE.

This most faithfully attached adherent and friend of Sir Walter Scott has had but scant justice done to him in the published versions of, and animadversions upon, his connection with the great commercial enterprise and melancholy catastrophe in which his ambitious principals became so miserably involved. Throughout all their joint transactions he was only a secondary ally, and yielded that allegiance which acknowledged superiority always commands from inferior powers. With relation to their conduct of business, I have no means to judge. It seemed to be all gorgeous and golden. Their credit was unbounded. Monte Christo himself could not be more profusely accommodated.* But let the cause of the failure have been what it might, James Ballantyne's share in it was simply his rising and falling with the genius he worshipped. He was a gentleman, and one of no ordinary intellectual capacity. The services he rendered (even as a printer anxious to rectify accidental mistakes) not only to the rapidly brought out writings of Scott, but to the productions of the Ettrick Shepherd and others, were of great value. I could furnish some striking instances; but suffice it to say that I have no reason to hold my estimable friend responsible for the crushing fact that, in glowing prosperity and prospects, the arm into which his was linked was stretched too far for safety, and could not be retracted to restore the hand its strength. Ballantyne survived Scott not quite four months.

Though this notice is rather a sequel to that of Sir Walter Scott (every matter touching whom will ever possess interest) than a separate attempt to supply characteristic traits of another, I must adventure a letter, which, setting apart its private flatteries, will speak fairly of the literary status and talent of James Ballantyne.

3, Heriot Row, Edin., May 10th, 1825.

MY DEAR SIR,—This letter is written to introduce to you my friend and brother-in-law, Mr. P., of Edinburgh. He has never been in London before, and is now on business which will leave him no great overplus of time to employ in amusement; but he has heard both my wife and myself speak so warmly and feelingly of your kind attentions, and very useful services, that I know I am gratifying him much by putting him within their exertion in his behalf, so far as is perfectly convenient and agreeable to you. You will find him a strong-minded clever man, of some humour, . . . and altogether a very excellent fellow. What kindness you can easily show him I shall receive as kindness to myself; and for him I can assuredly say that his greatest pleasure will be to requite it when you put it in his power. We are in sooth wearying for you here, and I really wish you would revisit Scotland, were it only to prove that it is not always the case that a prophet hath not honour in his own land.

The "Crusaders" will be out, I think, about the end of June. *Entre nous*, there will be five volumes. The first two are employed in telling a tale called the "Betrothed," being, in my mind, perhaps the most defective thing the author ever produced—not good at all, for HIM, that is. The other three are to contain the "Talisman," of which I think magnificently. In fact I do not know whether it will not restore the author to the very highest vantage-ground he has ever occupied. How the one is so little and the other so grand, nay, in sooth, I cannot tell; but it is so. I have no doubt you will agree with me. The portrait of Richard of the Lion Heart is exceeded by not one of his former creations, not, I think, by Rebecca; and there is an eastern physician and a hermit of unrivalled power. There is, farther, an admirable story, comprising one or two mysteries

* In the introduction to these Letters, I explained the difficulty, from their nature, of avoiding egotism, and I have only to hope that I may not be blamed for carrying it too far. Such illustrations of character as my theme required, and the long period which has elapsed, must plead my apology. It is not the mighty literary Enchanter of whom I am endeavouring to preserve some traits, but the individual man, Walter Scott, in his sayings and doings, as he lived.

* I remember my surprise when, on a visit to Rochdale, ensconced in the bank back parlour of my friend Mr. John Roby, I saw bills for many hundred pounds, between Edinburgh and London, and especially, if at long dates, gladly discounted as an excellent investment of money.

of great interest, but not yet unravelled. I speak of vol. 1 and the half of vol. 2, that is, of one half of the whole; and it is a fair presumption that, having proceeded so far so admirably, he will not come tardy off in what remains. This, by-the-by, is all to Mr. Jerdan, *not to the editor of the "Literary Gazette."*

Ever truly yours,

J. BALLANTYNE.

Five years afterwards, and nearer the end, a short note tells of the same kindly disposition and wish to benefit the deserving. It introduces one of the earliest and most popular illustrators of Scottish song that ever excited the admiration of the South.

18, Albany Street, Sept. 25, 1830.

MY DEAR SIR,—Allow me to introduce to you my friend Mr. Wilson, whose high merits as a vocalist are of course well known to you. He and I have been long acquainted, and I run no risk in pledging myself that he will do nothing but credit to your kindness.

In haste, believe me ever

Most sincerely yours,

JAMES BALLANTYNE.

JOHN BALLANTYNE.

It might seem a sort of assent to certain publicly expressed opinions if I refrained from adding a few words to the foregoing statements, and in defence of the reputation of John Ballantyne, the next brother to James, and one of the partners in the Edinburgh printing firm.* Some writers have spoken very disparagingly of him, and treated his intimate association with Scott as degrading to the latter.

I do not wish to defend anything in itself wrong; but I would respectfully suggest that it is unjustifiable to judge the manners of a former age by the standard of our present day. Scott and the Ballantynes had thirty years of the last century on their heads and hearts. They began their literary connection in the "Kelso Mail," established in 1797, when terror filled the country with a dread of Jacobin outrage, largely inspired by the sanguinary Revolution in France; hence their Toryism. And with regard to their social habits, these were in accordance with usages of too general prevalence over "the land of cakes." The readers of Dean Ramsay's "Characteristic Scottish Anecdotes" will understand me. The feelings and fashion of the age agreed entirely with the convivial enjoyments of Scott and his boon companions. No doubt the wine-cup, the speech, and the song of those times will not bear defence. Our generation has seen a great improvement in all these particulars. I venture simply to affirm that poor "Johnny" Ballantyne ought not to be singled out by critical censure as having been the main cause of the irregularities of others.

That he was the cherished associate of the mighty wizard is, in spite of the charge, something in his favour; and why he was so it is easy to tell. Scott was eminently convivial within the limits of becoming mirth, and "Johnny" (familiarily so hailed) was what is known in Scotland by the title of the "Whistle Binkie" of the company. Society delighted in him. His humorous songs and comic stories were most entertaining and laughable. Of the former, some were indeed objectionable for any time or occasion (I remember one free enough even for that period, for I desire to speak with a clear breast); but in the latter he was unequalled. As a proof, I may state that he taught Matthews his popular tale of the

minister drenched with rain, who was comforted by the wife of his colleague bidding him "gang into the *poopit*, where he would be dry enuch!" and the pupil never reached the indescribable humour of his instructor.

But, lest I also should become "dry enuch" (having no letters of John Ballantyne), I shall conclude by affirming that Johnny Ballantyne had merits to make him worthy of Scott's regard, and that some of his faults may fairly be spoken of as those of the times.

THE MIDNIGHT SKY AT LONDON.

APRIL.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

WHEN we direct our attention to the heavens on a clear starlight winter's night, the first impression on our mind is that an almost infinite number of stars is presented to our view. This is, however, merely an optical illusion produced principally by the twinkling of the stars, and by their irregular position in the sky, for the whole extent of the heavens is too vast to be included at one time in the field of vision. Hence arises the erroneous impression that the number of stars is so great. Now, on the contrary, seldom more than two thousand can be perceived by an ordinary eye at once, including all stars down to the sixth magnitude above the horizon. Observers, however, with superior eyesight can occasionally detect objects of the seventh magnitude, but this exceptional vision is very unusual. There are only twenty-four stars of the first magnitude in all parts of the heavens, several being visible only in the southern hemisphere. The stars of the second magnitude number about fifty, and of the third about two hundred. Including all stars down to the sixth magnitude, or within the limits of ordinary vision, about five thousand stars altogether can be seen in the latitude of London during the year. But if we view the sky with a very powerful telescope, the minute objects composing the groundwork of the heavens may be counted by tens of thousands, or even by hundreds of thousands of stars.

The observed diminution in the magnitude of objects, as well as the increasing numbers contained within the field of view, as their distances increase, may be briefly explained as follows. Let us imagine a person standing in the middle of a forest, surrounded by trees in every direction. Those nearest to him would be few in number and the trunks comparatively large; but if he were to take the next circuit of trees outside those around him, the visible trunks would be increased in number, but their dimensions would appear smaller. Proceeding onwards in this manner, the trunks of the trees would at last be very numerous indeed, but their apparent size would bear no comparison in magnitude with those near the observer. But still these apparently small distant trees might be really considerably larger than any in the whole forest. We will now substitute the stars for the trees. For the sake of analogy, let us now suppose that the observer on the surface of the earth is situated in the centre of a forest of stars, of indefinite extent; those few which are nearest to our own system would appear large and bright, and we distinguish them of the first magnitude; those which are farther removed from us would appear in greater numbers, but with less intrinsic brightness—these we call of the second magnitude; those which are still farther from us would be considerably increased in number, but their magnitude would appear much smaller. If we continue increasing the distance, the decrease of brightness will

* Alexander, the third and youngest brother, was an accomplished and charming musician. I believe that several of the family live at the present time, as their distinguished representatives in the arts and literature.

be in inverse proportion to the increased number of the stars, till we are stopped by the limit of vision. With telescopic aid, the observable stars are too numerous for any accurate determination of their numbers. M. Argelander, a zealous German astronomer, has, however, actually published a catalogue of the exact positions of no fewer than a quarter of a million of stars greater than

INDEX MAP, LOOKING NORTH, APRIL 15.

the tenth magnitude. These numbers nevertheless fail to represent properly the boundless extent of the stellar universe, for every improvement in the construction of astronomical telescopes unfolds to the view of the astronomer hundreds of thousands of minute stars which had never been resolved before. Sir John Herschel remarks that "beyond the limits of unaided vision, telescopes continue the range of visibility, and magnitudes, from the eighth down to the sixteenth, are familiar to those who are in the practice of using powerful instruments; nor does there seem the least reason to assign a limit to this progression; every increase in the dimensions and power of instruments, which successive improvements in optical science have attained, having brought into view multitudes innumerable of objects invisible before; so that, for anything experience has hitherto taught us, the number of the stars may be really infinite, in the only sense in which we can assign a meaning to the word."

INDEX MAP, LOOKING SOUTH, APRIL 15.

The aspect of the midnight sky of April is somewhat different from that depicted in the diagrams for March, numerous stars of large magnitude having since last month made their appearance in the east and south-east, while some conspicuous objects in the west have dis-

appeared below the horizon. The stars above the second magnitude, now visible south of the zenith, are Regulus in Leo, Spica in Virgo, Arcturus in Boötes, and Antares in Scorpio. Taken as a whole, the south sky at midnight still contains a considerable number of interesting objects, although no constellation has that striking appearance which Orion and some others present at an earlier or later period of the year. For example, we have still the bright stars in Leo and Virgo in the western part of the sky, while on the eastern side of the meridian the bright stars in Boötes, Serpens, and Scorpio are conspicuous objects at different altitudes. There are numerous other constellations, which we shall endeavour to point out to the observer, who, with the assistance of our diagrams, will, we expect, have no difficulty in identifying the principal stars. By the knowledge of these stars he will have some idea of the positions of the constellations of which they are the chief members.

We must again suppose the observer standing with his back to the Pole star, with his eye directed along the plane of the meridian looking due south. At first, however, we would wish him to look directly overhead, still with his back towards Polaris. He will then perceive that the last of the stars in Charles's Wain, in Ursa Major, is very nearly in the zenith; it is really about two degrees south of that point. This is the only month that this star, Eta Ursæ Majoris, or, as it is sometimes named, Alkaid, is in the south half of the sky; in our diagrams for March and also for next month, it will be found with its six companions in the northern half. Passing the eye downwards, a bright star, with a reddish tinge, strikes our attention slightly east of the meridian; this is Arcturus. Considerably lower, a few degrees west of the meridian, the white star Spica shines brilliantly. Confining our remarks for the moment to the western sky, and commencing from the zenith, or the centre of the upper portion of the diagram, the first star which will probably be noticed is Cor Caroli, the chief member of the small constellation of Canes Venatici (the greyhounds). It will be remarked that Cor Caroli is in an isolated position, no star of equal magnitude being near it for some distance on all sides. Then comes the group of small stars in Coma Berenices, below which, extending from the meridian to a considerable distance towards the west and south-west, Leo and Virgo occupy the major portion of the sky. The principal stars in Leo are all visible about midway between the zenith and horizon, or in the right hand upper corner of the lower diagram; they may be recognised in two ways, one by the irregular trapezium formed by the brightest objects, and the other by the imaginary appearance of a sickle produced by a group of six or seven stars, of which Regulus is the most southerly. The best time, however, for recognising this celestial reaping-hook is when it is

*** The identification of the principal stars in the two views will be much facilitated by reference to the index-maps, which have been specially prepared to assist the reader while comparing the diagrams with the descriptive letter-press. The names of the stars of the first and second magnitudes are generally inserted, and a few of the third. By these additional diagrams we hope that the practical usefulness of the star-views will be considerably increased.

It may probably be useful to mention again here, although we have incidentally alluded to it more than once in our descriptions, that the zenith is that point of the heavens directly overhead, and that the centre of the upper boundary-line in the diagrams coincides exactly with it. The meridian is an imaginary line dividing the visible heavens into two portions, one on the right, and the other on the left of the observer. The meridian line, therefore, passes from the north horizon to the south, through the celestial pole and the zenith. From this the reader will understand that in the diagrams a line drawn from the zenith through the centre will represent the celestial meridian of the observer's station.

THE MIDNIGHT SKY AT LONDON, LOOKING SOUTH, APRIL 15.

situated nearer the meridian in the earlier hours of the evening, or about 8 P.M. in April, when it can be seen to great advantage and with considerable clearness. This group, near which is the radiant point of the November stream of meteors, consists of about six stars of average magnitude, one being between the first and second, one of the second, two of the third, and two of the fourth magnitude. Between Leo and the meridian, most of the chief stars in Virgo are situated, but excepting Spica, none of them is greater than the third magnitude. One of these is, however, a most interesting binary star, perhaps the most carefully observed of any in the heavens. Some account of the relative movements of its components will be given when we treat specially of the constellation Virgo. The south-west portion of the sky towards the horizon is occupied chiefly with the small constellations, Corvus and Crater, while Hydra is spread over the horizon from west to nearly south.

East of the meridian, and at no great distance from it, the constellation Boötes, containing Arcturus and several stars of the second and third magnitudes, is the most attractive group in that portion of the heavens. Below Boötes, about half-way between the zenith and horizon in the south-east, is Serpens, and lower still, near the horizon, Scorpio will be recognized by several bright stars, of which the principal is Antares, of the first magnitude. This constellation is very prolific in stars of the fourth and fifth magnitudes. In the east-south-east, Corona Borealis is easily distinguished near Boötes by its semicircular group, in the centre of which is Alpha Coronæ, known also frequently by the names of Gemma and Alphecca. East of Corona Borealis and Serpens are the important constellations Hercules, Ophiuchus and Aquila, the last occupying the eastern horizon.

The principal constellations in the midnight south sky of April have been generally mentioned in our preceding remarks. The complete list consists of the whole of Sextans, Crater, Corvus, Leo, Virgo, Libra, Canes Venatici, Coma Berenices, Boötes, Corona Borealis and Ophiuchus, and parts of Hydra, Leo Minor, Ursa Major, Hercules, Aquila, Scorpio, and Centaurus.

The constellation Virgo, which occupies a considerable portion of the sky west of the meridian at midnight, and east of the meridian in the earlier hours of the evening, is the sixth sign of the zodiac. It was popularly considered in former times as the sign belonging to the harvest season, because when the sun enters it the cereal crops are ripe for the sickle. In most representations of Virgo, therefore, she appears sometimes as Ceres and sometimes as an angel, with ears of corn in her hand, defined in the heavens by the position of the bright star Spica. On this subject, Admiral Smyth has remarked that "we are told that among the Orientals she was represented as a sunburnt damsel, with an ear of corn in her hand, like a gleaner of the fields; but the Greeks, Romans, and moderns have concurred in depicting her as a winged angel, holding wheat ears, typical—of the harvest, which came on in the time of the Greeks as the sun approached Spica. She forms a conspicuous and extensive asterism, replete with astronomical interest." Virgo is bounded on the east by Libra, on the west by Leo, on the north by Boötes and Coma Berenices, and on the south by Corvus, Crater, and Hydra. The number of stars in Virgo observed by Ptolemy was thirty-two, but Flamsteed has recorded one hundred and ten, and in Bode's Celestial Atlas four hundred and eleven are inserted.

The most brilliant star in Virgo is Spica, which forms,

as we have previously mentioned, almost an equilateral triangle with Denebola in the tail of Leo and Arcturus in Boötes. Spica may also be found by drawing a straight line from Beta Boötes through Arcturus, and may also be readily distinguished by its isolated appearance. Among other star references a long line drawn from Dubhe, in Ursa Major, through Gamma in the same constellation, will reach Spica. Or a line from Polaris, through Mizar, the star in the middle of the tail of the Great Bear, will also pass through Spica. The following lines will popularly guide the observer to the positions of several bright stars now above the horizon:—

"From the Pole-star through Mizar glide
With long and rapid flight,
Descend, and see the Virgin's spike
Diffuse its vernal light.
And mark what glorious forms are made
By the gold harvest's ears,
With Deneb west, Arcturus north,
A triangle appears;
While to the east a larger still,
Th' observant eye will start,
From Virgo's spike to Gemma bright,
And thence to Scorpio's heart."

The principal remaining stars in Virgo can be easily identified between Spica and Denebola. They are, however, generally known only by a Greek letter attached to the name of the constellation. The first of these stars from Spica is Gamma Virginis, the two nearer the zenith are Delta and Epsilon, and the two west of Gamma are Eta and Beta. The last star is below Denebola.

By far the most interesting object to astronomers in Virgo is acknowledged to be that extraordinary binary system known as Gamma Virginis. Its position can be identified in the heavens from the preceding explanation. This class of stars, above all others, exhibits to us the proof of the law of gravitation being as applicable in remote regions of the universe as in the comparatively smaller interval of space occupied by the members of our own solar system. It will not be out of place to remark here that double stars are very common in all directions of the heavens, that there is scarcely a constellation in which several are not to be found, and that the number of these objects catalogued by different observers amounts to several thousands. But ordinary double stars must not be confounded with those which have been proved by observation to belong to a common system, for many of them are known to be only optically double. For example, two stars appearing to the naked eye as one object, but through a telescope as two, may be separated from each other by a distance as great as between any two stars in the heavens, though by accident they are viewed from the earth in the same line of direction. These apparently double stars are consequently always observed in the same relative order, so that their telescopic measures of distance and angular position remain for ages without sensible alteration. But in the double stars known to be physically connected hence their name of binary stars—these measures of distance and angular position are always changing more or less, and when observations are made at different epochs, the movements of the stars with respect to each other are very evident indeed. Sir John Herschel remarks that "we have the same evidence of their rotations about each other that we have of those of Uranus and Neptune about the sun; and the correspondence between their calculated and observed places in such very elongated ellipses, must be admitted to carry with it proof of the prevalence of the Newtonian law of gravity in their systems, of the very same nature and

cogency as that of the calculated and observed places of comets round the central body of our own."

As an example of a binary star, we could not select a more appropriate one for our purpose than Gamma Virginis, because it is one which has received constant attention since the beginning of the eighteenth century. When Mayer observed it in 1756, the distance between the two stars was found to be six and a half seconds of arc. Sir William Herschel, in 1780, observed this space to be one second smaller. From recorded observations since that time, the stars have been seen to approach each other gradually, till at length, in 1836, they were so close that the highest magnifying power, applied to the most celebrated telescopes, was unable to separate the two components. After this the star gradually opened, and in 1837 was again seen double when viewed through a good telescope. In 1840 the distance between the components was observed by the Rev. W. R. Dawes, who found it nearly a second and a half; in 1852, from observations made at the Royal Observatory, this distance had increased to upwards of three seconds; and from some excellent measures made by the Rev. R. Main, at Oxford, in 1864, the space between the two stars was equal to four seconds and a quarter. At the present time it slightly exceeds this quantity. In all probability in a few years hence the relative appearance of the stars in Gamma Virginis will be similar to that first recorded by Bradley in 1718, since which time one complete revolution will then have been made. This period, computed from the observations, is about 180 years. In the small diagram of Gamma Virginis we have given a selected number of the telescopic appearances of this beautiful star, which will possibly give a better idea of the relative movements of the components than by any further detailed description.

Two small constellations north of Virgo, extending together nearly to the zenith, are worthy of notice, though they are not celebrated for the magnitude of their stars. That nearest Virgo is Coma Berenices, named after the wife of an ancient king of Egypt. This lady vowed to consecrate her fine head of hair to the goddess Venus, if her husband returned in safety from a dangerous expedition. On the return of the king, she caused her locks of hair to be hung up in the Temple of Venus; but in a short time they were found to have disappeared. A wise man of the time, one Conon, an astronomer, declared that they were taken by Jupiter, who turned them into a constellation of stars. This fable, like many others of the same kind, must only be taken for what it is worth; but it is true enough that several of the ancient philosophers have alluded to these stars as "the tresses." To the naked eye, the principal group has a nebulous, or rather woolly appearance, owing to the aggregation, in a limited space, of a number of stars of the fourth and fifth magnitudes. These can be easily found by drawing an imaginary line from the

bright star Alkaid on the tip of the tail of the Great Bear, through Cor Caroli, as far as Denebola. About midway between the two last-named stars, the line will pass through the group. By reference to our south diagram, it can be recognized by a line of five small stars, mostly of the fifth magnitude. This is the smallest class of stars inserted in the large diagrams.

Canes Venatici, or the greyhounds Chara and Asterion, form a small constellation of comparatively recent origin, having been introduced into the heavens by Hevelius, in the seventeenth century. It is situated north of Coma Berenices, and occupies an empty space between Boötes and the hind legs of Ursa Major. Excepting its principal star Cor Caroli (Charles's heart), there is no object worthy of special notice in this constellation: In most celestial atlases or globes, Cor Caroli is placed in the centre of a heart attached to a crown on the shoulders of Chara. It is a beautiful double star, the larger component being white, and the smaller a pale lilac colour. The following anecdote of the origin of the name of this star is given by Admiral Smyth: "But it came to pass that it was named Cor Caroli by Halley, at the suggestion of Sir C. Scarborough. The popular story, or rather the vulgar one, runs—how Scarborough, the court physician, gazed upon a star the very evening before the return of King Charles II to London, the which, as in duty bound, appeared more visible and refulgent than heretofore; so the said star, which Hevelius had already made the lucida of Chara's collar, was thereupon extra-constellated within a sort of valentine figure of a heart, with a royal crown upon it; and so the monarch, it would seem by this extraction, remained heartless." Cor Caroli can be readily identified by reference to the south diagram; also a line drawn from Polaris through the first star in the tail of Ursa Major will lead directly to it. If we take advantage of the rhymester, we shall obtain other directions for finding not only Cor Caroli, but also the important group of Corona Borealis.

"When clear aloft, Boötes seek,
His brilliance leads the gaze,
And on each side its glitt'ring gems
The spacious arch displays;
Arcturus east to Vega join,
The Northern Crown you'll spy.
But west, to Ursa's second star,
He marks Cor Caroli."

The principal constellations visible at midnight in the northern sky, in addition to those which are wholly circumpolar, are Lyra, Cygnus, Lynx, Vulpecula, and parts of Cancer, Gemini, Auriga, Perseus, Andromeda, and Aquila. At this time, six of the seven principal stars in Ursa Major are near the zenith a little to the west of the meridian, the seventh in the tip of the tail being about two degrees south of the zenith. Below Ursa Major, towards the north-west, are the constellations Lynx and Camelopardus, in both of which there is scarcely any star greater than the fifth magnitude; consequently this portion of the heavens looks comparatively bare. A considerable number of small stars are, however, contained in these two constellations, though not inserted in the diagram, to prevent confusion in the mind of the reader. In the W.N.W., between Lynx and the horizon, Castor and Pollux can still be distinguished, and towards the north-west, near the Milky Way, Beta Aurigæ and Capella are very conspicuous. Near the north horizon, several bright stars in Perseus can be seen slightly west of the meridian, while about the same distance east, but nearer the pole, Cassiopeia is visible. Proceeding eastward, the

stars of the first magnitude, Alpha Cygni and Vega, shine above all others near them; and almost due east, and very near to the horizon, the chief stars in Aquila have just risen. The strictly circumpolar stars, in Draco and Cepheus, can be generally recognized east of the meridian between Polaris, Alpha Cygni, and Vega. The stars in Ursa Minor are now nearly all between the zenith and the pole, Kocab, or Beta Ursæ Minoris, being near the meridian.

POSITION OF VENUS AT 8 P.M., APRIL 15.

During April, 1868, the planet Venus is the evening star, and will be a very conspicuous object in Taurus in the western sky soon after sunset, and in the W.N.W. for some hours afterwards, exceeding in splendour the brightest of the fixed stars. She disappears below the horizon on April 1st. at 10.40 P.M., on the 15th at 11.16 P.M., and on the 30th at 11.42 P.M. Mercury and Mars are in unfavourable positions for observation, either with the naked eye or telescope, both planets rising only a short interval of time before the sun. Mercury will be at no great distance from Jupiter on the 13th, and from Mars on the 17th. Mars rises on the 1st at 5.11 A.M., and on the 30th at 4.42 A.M. On the 8th he will be in conjunction with Jupiter, when the two planets will be remarkably close to each other. Jupiter will be visible in the morning throughout the month, shortly before sunrise. On the 1st he rises at 5.15 A.M. or twenty-one minutes before the sun, and on the 30th at 3.33 A.M., or about an hour before sunrise. Jupiter will not, however, be well seen till after the middle of the month, when his four satellites will again be visible after having been lost in the rays of the sun since the beginning of February. Of the large planets, Saturn only can be favourably observed. On the 1st he rises about three-quarters of an hour before midnight in the south-east; on the 15th at 10.18 P.M., and on the 30th at 9.15 P.M. Saturn will be sure to attract attention. For several months he will be situated in the constellation Scorpio, and very near to the stars Beta Scorpii and Antares. The three objects will not differ much in magnitude, but the planet may be identified by its white and steady light, while that of Antares is of a reddish tinge, and Beta Scorpii is the smallest of the three.—Uranus can be easily seen with the aid of a telescope, and occasionally by the naked eye, in the absence of moonlight, when its exact position amongst the neighbouring stars is known. This planet sets at 2 A.M. on the 1st, and soon after midnight on the 30th.—The planet Neptune, though nearly equal in bulk to Uranus, is so far distant from us that it appears in the field of view of a telescope no greater than a star of the seventh or eighth

magnitude. It is, therefore, always invisible to the unassisted eye, and, consequently, its movements can never be of much popular interest.

The moon will be in the constellation Cancer on the 1st and 2nd of April, and in Leo from the 2nd to the 4th. On the 3rd, at about 8 P.M., she will be very near the star Regulus. On the 5th she enters Virgo, continuing in this sign till the 7th. On the 8th and 9th she is in Libra, and on the 10th in Scorpio. After this day the moon is only visible in the morning hours till new moon. On the reappearance of the young crescent moon, she will be in the constellation Taurus, passing on through Gemini and Cancer by the end of the month. The star Aldebaran, in Taurus, will be very near to the moon on the morning of the 25th; and on the 30th, near midnight, Regulus will, for the second time this month, be very near the moon. The changes of the moon will take place as follows:—Full moon on the 7th at 7.17 A.M.; last quarter on the 14th, at 10.34 P.M.; new moon on the 22nd, at 8.20 P.M., and first quarter on the 29th, at 6.18 P.M.

Our description of the positions of the stars at midnight on April 15th, will, with the diagrams, be also available on May 15th, at 10 P.M., on January 15th at 6 A.M., on February 15th at 4 A.M., and on March 15th at 2 A.M.

THE GAS WE BURN.

THE use of coal-gas for domestic purposes has been common in this country for more than fifty years, so that the proportion of our existing population, who can recall the aspect of London and other great towns as it was before gas became common, is but comparatively small. For the sake of those of our readers to whom the manufacture of gas is practically a mystery, we are going briefly to describe the processes by which the coal that warms our dwellings and cooks our food, is made also to yield us light within doors and without. London and London suburbs contain more than a score of gas factories, and there is hardly a town in England that does not boast its own gas-works. Everybody has seen the huge gasometers towering above the chimneys, and has encountered the gangs of sooty-faced men going to and fro at their labour; while few have had interest or curiosity enough to explore these resorts of curious industry, and to observe what is constantly going on there without pause or intermission, from one year's end to another.

On entering a gas-work we do not fail to remark that the several operations necessarily cover a considerable area of ground, not the least portion of which is occupied by the enormous circular vessels which are the storehouses of the gas when its manufacture is completed, and from which it passes into the mains, or street-pipes, by which it is led off; it may be to the distance of many miles, for the service of the public.

Passing on amid these monster vessels, and various smaller structures of somewhat similar form, among which are rows of tall pillars coupled together at the top, we follow our guide to the retort-house, where the business of making gas may be said to begin. The spectacle is sufficiently startling and impressive to one who witnesses it for the first time. It is night, and the stars are shining clearly, and so is the half-moon, in the cold blue sky aloft, and as you look up you see them glimmering through the lurid smoke and smother of the scene. At first you do not know what to make of it. You are in a kind of cavern some hundred yards long and not

ten wide, the walls of which are spouting fire in fifty places at once, and every now and then bursting out at some new point. Groups of men of weird aspect and frantic gestures, half-clad and begrimed with coal-dust, are poking with long pikes at the spouting flames, and raking forth masses of glowing matter, while others are thrusting fresh fuel into the fiery mouths and rapidly closing them up. After a while these operations begin to explain themselves. The fire-spouting holes are the mouths of the retorts in which the coal is burned. The retorts are hollow iron cases about seven feet long and rather cylindrical in shape, with a diameter of some fourteen inches or more. They are closed at the farther end, and are only opened at the mouth for the admission and withdrawal of the fuel. They are kept constantly at a red heat by means of fierce fires of coke, the furnaces being so contrived as to subject them all to a great, and, as near as possible, an equal heat. The retort is filled by means of a long iron scoop fitting its interior, by which the charge of coal is readily introduced, and, the scoop being inverted, is withdrawn empty: the right charge is about two-thirds of the quantity the retort would hold; it would not do to put in more, because the coal will be transformed into coke when it comes out, and will have increased about one-third in bulk, for which increase space must of course be allowed. The moment the charge of coal is introduced, so great is the heat it meets that it bursts into flame; and if now the mouth of the retort were suffered to remain open the coal would be consumed as coal is consumed in an ordinary grate, resulting only in flame and cinders. But flame cannot exist without air, and the mouth of the retort being closed up and the air excluded, the disengaged gas, which would be flame if air were present, escapes up a tube fixed over the mouth of the retort, which tube dips into the hydraulic main—a large iron pipe running along above the topmost retorts and communicating thus with every one of them. As the distillation of the coal goes on, a quantity of tar, ammoniacal liquor, and other matters, rises along with the gas through the connecting pipe, and flows over into the hydraulic main, which is so contrived as always to be about half-full of this semi-liquid stuff; the feeding-tubes from the retorts all dip below the surface of the liquid, by which arrangement any return of the gas is prevented when the charges of the retorts are drawn or they have to be repaired or otherwise interfered with.

We have said that the retorts are somewhat cylindrical in shape: we may add that the shapes vary in different factories, and also for different objects. Some are strictly circular; a cross-section of others would show them in a greater or less degree oval; others, again, are waggon-shaped; while many are known from their form as "kidney-shaped." The waggon, or  shaped, appear to be very generally used. The retorts are arranged in sets, and a set may consist of three, five, seven, or nine, according to the size of the furnaces and the convenience which space may afford for their arrangement. Each set of retorts has its own furnace or furnaces, and its own working gang. The time during which the retorts are kept burning will depend in some degree on the nature of the coal used, and may vary from six to eight hours, though the operation may be greatly accelerated in cases of urgent need. It is not advisable to continue the distillation too long, because the best gas is that which is first produced, while that obtainable after a certain lapse of time would be so bad as to be not merely valueless but detrimental. To ensure good distillation, the retorts should be heated to a red heat, and maintained at a regular temperature. If the retorts are not

sufficiently heated at first, the gas given off would burn with only a feeble light; and if they are allowed to get too hot, the produce may be gases that give still less light, or even nitrogen and carbonic acid, which extinguish flame.

As the gas, together with the tar, ammonia, etc., flows from the retort-tubes into the hydraulic main, the heavier matters are led off through a pipe in the main conducting to a tar-cistern, generally underground, the pipe being so adjusted as to leave the main always half-full of the tarry fluid. The gas, by its own elasticity, forces its way from the main into coolers or condensers, consisting for the most part of a series of tall, upright pipes, enclosed in larger ones, the spaces between the outer and inner pipes being filled with water flowing through in a cool stream. The pipes through which the gas circulates open at the bottom into a kind of chest or tank, in separate divisions, into which the tar condensed on the cool surface of the pipes trickles down, and whence it can be drained off into the tar-cistern at pleasure.

On entering the condensers the gas is at about the temperature of 120 deg., and it cools down to 60 deg. before leaving them. Though it has parted with the mass of its impurity in the condensers, it is not yet by any means in a fit condition for use, as many injurious gases are mixed with it, the action of which on the luxurious contents of some of our dwellings, and on our own sensations, would be anything but agreeable. These noxious elements have therefore to be removed by purification; and it is in this department of gas-making that the greatest difficulties have been encountered, and the most valuable improvements have been effected. Up to a comparatively recent period, the purification of coal-gas was accomplished almost entirely by the use of lime or lime and water. The gas was passed in the purifiers through lime-water, or through layers of lime slightly moistened; and, as a large quantity of lime was necessarily used, and immense masses of it became saturated with foul gases, the odours it gave off were disgusting beyond expression; and it was this vile fetor which in past years rendered the very neighbourhood of a gas-work unbearable. The necessity for perpetuating such a nuisance, however, no longer exists, and in some of the London gas-works the whole manufacture is conducted throughout without the prevalence of any disagreeable smell, and even with less annoyance from that source than one meets with in average workshops.* This improvement has been brought about by the substitution of oxide of iron instead of lime in the purifiers, or rather, of an artificial compound containing such chemical constituents of oxide of iron as have the required purifying power. The substance looks like sawdust dyed brown; it is almost odourless before use, and even after use, when it has taken up the impurities of the gas, and is stained by them to a dense black, it may be freely handled without unpleasantness.

The purifiers, into which the gas passes after leaving the condensers, are large rectangular vessels, wide as the floor of a room, about three feet in depth, and fitted up interiorly with three stages on floors one above the other, the stages consisting of laths of wood, very narrow and nearly touching each other, and the whole stage being divided into sections, so as to be easily removed when necessary. On these several floorings of lath the brown oxide is spread loosely to the depth of an inch or more, and the lid of the purifier is then let down,

* At the Equitable Gas-works, for instance, the processes of gas-making are gone through, not merely without annoyance to the neighbourhood, but almost without any perceptible odour in any part of the premises.

making all gas-tight. The gas, turned into the purifier from below, rises through the several layers of oxide, parting with its impurity as it goes. Above the top-most layer an open pipe leads away from the first purifier to the second, where the gas passes through a second series of the oxide-laden floors of lath; and from the second purifier to a third, and from a third, if need be, to a fourth. When the purifying power of the oxide is exhausted it is withdrawn, and is exposed to the action of the atmosphere, by spreading it thinly on the floor of an upper room. No foul smell results from such exposure, as there would be in the case of lime; yet the oxide, from being as black as ink, recovers its bright brown colour by degrees, and recovers also, to a considerable extent, its purifying power. It is but right to state here that lime is still used for the final purifying process, as applied to the best gas—the gas which is made of cannel coal, which is rendered as pure as it is possible to render it, and is supplied to the dwellings of the upper classes.

After passing through the purifiers, with their many strata of iron-oxide, or lime, the gas is so far cleansed that it might be stored for use, and left to get rid of the ammonia which it still contains, by contact with the water in the gasometer. But though the water would absorb the ammonia if the gas were kept long enough, it will not do so very quickly; and hence it becomes necessary to get rid of the ammonia in some other way. This is done most satisfactorily by means of what is called the "scrubber," which is nothing more than a tall tank as big as an average haystack; the tank is filled with lumps of coke, over and through which water is constantly trickling from a perforated tube at the top. The gas, being let in at the bottom of the tank, as it rises meets the descending water, with which every particle of it comes into contact, owing to the extensive surface of the wet coke, and the ammonia is thoroughly taken up by the water, which thus acquires a commercial value.

The manufacture of the gas is completed with its satisfactory purification; but hardly less onerous and responsible is the business of storing it, and of dispensing it to the public.

The gas, after purification, is stored in the large circular gasometers which are such conspicuous objects in every gas-work; but before it is conveyed into them it has to be passed through the station-meter, which registers the quantity of gas made in any given period, from an hour to a month or more, and which, being furnished with dial-plates and moving indexes, shows the rate at which gas is being made at all hours of the day and night throughout the year. At those establishments where two different qualities of gas are made, there must be of course two station-meters, as well as two lines of street mains.

The gasometer has not only to store up the gas as fast as it is made, but to weigh upon it with sufficient pressure to force it along the street pipes, so that it may issue from the jets at a uniform rate and burn with a steady flame. The gasometer is a large cylinder, sometimes of enormous dimensions, formed of iron plates riveted together and strengthened with internal rods and bars, and closed at the top, while it hangs or floats with its open end in a cistern of water just large enough to receive it. Whatever the size of the cylinder, its form is invariably the same, its height being just one half its diameter, such being the form which gives the greatest capacity; in practice, however, a little is added to the height, to prevent the escape of gas when the cylinder rises to its greatest elevation in the water.

Years ago it was rare to see a gasometer more than forty or fifty feet in diameter, and we remember when the erection of one of sixty feet was recorded as a triumph; at the present time there are cylinders of a hundred and fifty feet diameter, and more than that—the largest containing over half a million of cubic feet of gas when full.

The gas enters the gasometer through a pipe leading from the purifiers, and rising centrally above the water in the tank. As it comes in it forces up the cylinder, which continues to rise slowly, in spite of its vast weight, forced up by the elastic power of the gas, which in many cases is fanned onwards from the purifiers by a steam-engine. Close to the pipe through which the gas enters is another pipe of about the same diameter, connected with the street mains, and along which, urged by the pressure of the mass of the cylinder, it rushes with a force which can be regulated by increasing or diminishing the superincumbent weight, but which must be sufficient to propel it through the smallest pipes at the greatest distance it has to travel. Ingenious contrivances are had recourse to in order to maintain a uniform pressure—not an easy thing when we reflect that, as the gas becomes exhausted, the gas-holder, by dipping into the water, must part with some considerable portion of its propelling weight at the very time when it is most wanted. In the case of very large gas-holders this business is managed much more easily than in the case of smaller ones—it being possible, by a careful adjustment of weight and bulk, to make them self-regulating.

The large consumption of gas in London necessitates the keeping of an immense store on hand; and, at the same time, the dearth of land renders the multiplication of gasometers expensive, and, in confined areas, impossible. To meet this difficulty, gasometers are often constructed on the telescopic principle. The telescopic-gasometer consists of two, three, or more concentric cylinders, the bottoms and tops of which, except the top of the uppermost, are furnished with flanges turned in opposite directions, the flange turning outwards and upwards at the bottom, and inwards and downwards at the top. The uppermost cylinder is covered at the top, but the others are open both at top and bottom. Supposing the gasometer to be empty, all the cylinders will be sunk in the cistern, like the tubes of a telescope in its case; when the gas is introduced, the innermost cylinder will rise first, and when its bottom reaches nearly to the surface of the water, its curved flange lays hold of the flange of the next cylinder, which also rises; and when this has advanced sufficiently high, it lifts the next. The escape of gas and the admission of air are prevented by the lower flange of each cylinder taking up a quantity of water, which acts as a water-lute. By means of this bold and ingenious contrivance, it is evident that two, three, or more gasometers are made to occupy but the area of one.

We need not follow the gas after it leaves the gasometer on its devious journey through the streets and far-stretching suburbs. The means and the methods of its distribution are well known, and need not be here described. We may conclude this brief sketch with one or two items of a statistical kind.

In burning coal for making gas, the quantity of gas produced varies greatly with the description of coal used, the coal from some districts yielding twice as much gas as that from others. Taking the average of the coal used in London, we are quite within the mark in stating that each ton produces ten thousand cubic feet of gas. The other saleable products are fifteen hundred pounds of coke and twelve gallons of tar, not to mention the

ammoniacal liquor. Of the coke, about one-fourth is used for heating the retorts, the remaining three-fourths being sold, and contributing, by its sale, very largely to the profits of the trade. From the tar various products are obtained by distillation. Considering the price we pay for gas, and connecting that with the value of the secondary products, it would appear that the profits of gas-making must be abnormally large; but, on the other hand, we must take into account the cost of production, represented not so much by the price of coal and the wages of the workers, as by the enormous capital invested in the necessary plant, and buried for the most part in the ground. The gas mains of the various London companies at the present time, taken in the aggregate, are not much less than three thousand miles in length. There is hardly any other species of manual industry carried on at so great an outlay.

It would be interesting to know what is the actual quantity of gas produced in London in the course of a year. We have seen no recent estimate, but in 1848 the quantity made was 3,200 millions of cubic feet, and the price paid for it by the public was £700,000. Now it has been stated that the quantity of gas required for the consumption of London doubles every ten years; if this be so, the present rate of production must be more than 12,000 millions of cubic feet per year, and the consumption of coal must amount to 1,200,000 tons. The price paid for the gas would not, however, be proportionately so large, the cost of it to the consumer having been considerably reduced of late years.

SPRING DAYS.*

SPRING days, sweet spring days, my quiet heart and rested eye tell me that there is no fear but that I enjoy you still!

"For lo, the winter is past,
The rain is over and gone;
The flowers appear on the earth;
The time of the singing of birds is come,
And the voice of the turtle is heard in our land."

This exquisite poetry has its voice of delight for me, and as I shut my eyes it brings a change over the bare boughs and the winter land. I dream of the chill black hedges and trees, flushing first into redness, and then "a million emeralds burst from the ruby buds." I dream of the birds coming back, one after one, until the poetry of the flowers is all set to music. And I go out into the land to behold, not only to dream of and image, these things. I watch for the delicious green, tasselling the earliest larch (there is one every year a fortnight in advance of the others) in the clump of those trees beside the road on my way home. I look, in a warm patch that I know, for the first primroses, and when I find them mildly and quietly gazing up at me from the moss, and ivy and broken sticks, and dead leaves, a surprise, although I was expecting them, and a dim reflection of that old child-joy bring with a rush to my heart again those "thoughts that do often lie too deep for tears." And in the garden I wander through the bare shrubberies, varied with bright box, and gather in my harvest there. The little Queen Elizabeth acornites, gold-crowned in their wide-frilled green collars; these are no more scant, and just breaking with bent head through cracking frosty ground. They have carpeted the brown beds, and are even waxing old and past

now. The snowdrops have but left a straggler here and there; and the miniature golden volcano of the crocus has spent its columns of fire. The hazels are draped with slender, drooping catkins; the sweetbriar is letting the soft sweet-breathed leaves here and there out of the clenched hand of the bud. The cherry-tree is preparing to dress itself almost in angels' clothing, white and glistening, and delicious with all soft recesses of clear grey shadow, seen against the mild blue sky. The long branches of the horse-chestnut trees, laid low upon the lawn, are lighting up all over with the ravishing crumpled emerald that bursts like light out of the brown sticky bud; as sometimes holy heavenly thoughts may come from one whose first look we disliked; or as God's dear lessons unfold out of the dark sheath of trouble. The fairy almond-tree—of so tender a hue that you might fantastically imagine it a cherry-tree blushing—casts a light scarf over a dark corner of the shrubbery. The laburnum is preparing for the summer, and is all hung with tiny green festoons. Against the blue sky, on a bare sycamore branch, that stretches out straight from the trunk, a glad-voiced thrush seems thanking God that the spring days are come. Wedged tight into three branching boughs, near the stem of a box-tree, I find a warm secure nest, filled with five little blue-green eggs. It is still a delight to me to find a nest; a delight, if not now a rapture, an intoxication.

All these I see on one spring day or another, as I walk into my garden, or out into the changing lanes. All these I see, and all these I love. But I see them, and I love them tenderly and quietly, not with the wonder and the glee of life's early spring days. I am sad, partly because I know that a great deal of that old wondering ecstatic thrill has gone.

"The rainbow comes and goes
And lovely is the rose,
The moon doth with delight
Look round her when the heavens are bare;
Waters on a starry night
Are beautiful and fair;
The sunshine is a glorious birth;
But yet I know, where'er I go,
That there hath passed away a glory from the earth."

It must be so, naturally, if only from the mere fact that things must lose their newness, and so their wonder, to the eye and the heart. Do what you will, you must become accustomed to things. And the scent of a hyacinth or of the may will cease when familiar to be the wonderful enchanting things that childhood held them to be. And the *thirtieth* time that we see, to notice, the first snowdrop bursting through the pale green sheath above the brown bed, is a different thing from the *third* time. We appreciate delights keenly when we are young, seek the same in later years, but never find them; and then all our life remember the search more or less regretfully. So Wordsworth, the old man, addresses the cuckoo that brought back his young days and his young thoughts by its magic voice:—

"Thou bringest unto me a tale
Of visionary hours.
"Thrice welcome, darling of the Spring!
Even yet thou art to me
No bird, but an invisible thing,
A voice, a mystery:
"To seek thee did I often rove
Through woods and on the green;
And thou wert still a hope, a love;
Still longed for, never seen.
"And I can listen to thee yet;
Can lie upon the plain
And listen, till I do beget
That golden time again."

* From "The Harvest of a Quiet Eye; Leisure Thoughts for Busy Lives." Published by the Religious Tract Society. A book of which Mr. Ruskin says, "I never saw anything more gracefully and rightly done—more harmoniously pleasant in text and illustration."

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Courper.*

MARY TALBOT'S SCHOOL-ROOM.

THE MORTONS OF MORTON HALL.

CHAPTER XXIV.—MR. ASTON ASTONISHES THE RECTOR BY DISCLOSING TO HIM HIS RELATIONSHIP TO MARY TALBOT.

A WEEK of weary days and restless nights succeeded the evening on which Mary Talbot had heard the story of the robbery. Mr. Sharpe's minute description of the locket that Mr. Aston had lost, convinced her that she had either that, or one precisely similar to it in her possession. Her very soul revolted against the thought that her brother had been guilty of the crime of which she now knew Mr. Aston believed him guilty; and

yet she felt that the circumstantial evidence against him was almost conclusive. Her heart told her still that Henry was innocent—that, when he came to hear of what had occurred, he would be able to vindicate himself. Still, twenty times a day she asked herself the questions—"Why did not he show *me* the captain's letter that so unexpectedly summoned him to London? Why did he not confide to *me* the name of his generous schoolfellow at Eton? Why did not he even mention the name of the jeweller from whom he purchased the locket?"

Had Henry done either of these things his sister felt

that it would have been in her power to make his innocence manifest to the eyes of others. But as matters were, she was obliged to acknowledge that if she were in Mr. Aston's place, she herself would have strong suspicions of his guilt.

She felt grateful to Mr. Aston, however, for having kept his suspicions to himself. But now that the secret had been confided to old Dame Hoolit, she feared that ere long it would be spread throughout the village; and, in that case, against whom would the finger of suspicion be pointed? Surely against her brother. She recollected that the old gossips had hushed their voices when one put the question, "Who was the thief?" She believed that the nurse already suspected her brother Henry; and would not the accused fishermen come forward, and, as with one voice, point out her brother as the probable thief, in order to vindicate themselves? She wept scalding tears at the thought of such shame and ignominy.

The morning after her walk home with the curate, she rose from her bed more weary than when she had lain down. She felt sick and faint, and would willingly have remained at home; nevertheless, she hastened to her duties at an earlier hour than usual, fearful lest Mr. Sharpe should call at the farmhouse to inquire after her health. She was terrified at the thought of anything that might draw attention towards herself. Had she known *herself* to have been guilty she could not have been more timorous. Even as she passed through the village, she fancied, though it was but fancy, that the demeanour of the people whom she met was different towards her. She fancied that suspicion had already got abroad, and that those whom she passed by gazed curiously at her, or shrunk from her. Some did gaze curiously at her, and some turned to look after her; but it was at her pale face and anxious weary looks that they gazed, and it was not scorn nor contempt, but pity for her anxiety that was in their hearts.

Mr. Sharpe kept his promise, and came early to the schoolroom. He found Miss Talbot busily engaged with a dull pupil, no "delightful task" for a weak frame and burdened spirit. On the part of the rector and Miss Wardour he urged her to return home and rest quiet for a few days. But she refused to listen, and, indeed, though she really needed rest, she was happier when her mind was employed, and when she was able to find a brief respite from the painful thoughts and deep anxieties in which she became absorbed whenever she found herself alone.

She looked forward more anxiously, more eagerly than ever, for the arrival of the American packet. It must, she thought, this time bring her a letter from Henry, and she had a strange hope, almost amounting to a belief, that the letter would contain some inference, or some explanation that would convince Mr. Aston, as well as herself, that her brother was innocent.

Alas for her hopes! As yet she had experienced but a forecast of sorrow and trouble. Her cup of bitterness had yet to be filled, and she was destined to drink it to the very dregs, though with her trials would come a support and comfort that she little dreamed of.

While brooding one evening over her troubles, the thought struck her that it was strange that the crest and motto of her mother's family should have been the same as those of Mr. Aston, and in the thought there was hope. Such being the case, might not the locket her brother had given her have belonged, as Henry himself had surmised, to some member of the Morton family? And if such were the case, what wonder that two lockets should resemble each other?

There seemed to her the more reason to believe that her brother's surmise was correct, in the fact that the portrait her locket contained bore so strong a resemblance to her mother and herself; and though Mr. Aston had not remarked this fact, but had appeared to think the miniature was the same that he had lost, he might, in his sudden suspicion, surprise, and anger, have merely remarked that there was the portrait of a female in the locket, without closely examining it.

Up to this moment she had been undecided as to what course she should pursue. Now she resolved to wait for the arrival of the expected letter, and then to seek an interview with Mr. Aston, and explain all that had passed between herself and her brother on the occasion of his return from London. Then, if Henry's letter did not contain in itself the exculpation she anticipated, she would write to him and tell him all that had occurred, and beg him to disclose the name of his old schoolfellow at Eton, and that of the jeweller from whom he had purchased the locket, and all would be satisfactorily explained.

That night she retired to rest with a lighter heart than she had known since she had heard the gossip of the two old dames in the cottage, and she rose in the morning happier and in better spirits than she had been for many weeks.

The next day the American packet arrived at Falmouth, but it brought no letter from Henry Talbot. It brought, however, the full particulars, gathered from the survivors, of the capture of the Amazon by pirates in the Gulf of Mexico, of the subsequent foundering of the ship, of the escape of the crew and passengers in the ship's boats, and of the supposed loss of two of those boats at sea, one having been picked up, bottom upwards, off the coast of Cuba, while the other had neither been seen nor heard of. There existed no doubt in the minds of the writers in the newspapers that all who were on board these boats had perished.

Then followed a list of the names of the survivors, among which neither the names of Captain Dobson nor Henry Talbot were to be found; and, moreover, one of the survivors had positively stated that the captain, and a Mr. Talbot, and six ladies, had quitted the ship's side in the pinnace, which had taken the lead of the other boats.

Mr. Aston received a packet of these newspapers by the mail, and he immediately carried them to the Rectory, and told Mr. Sinclair and Miss Wardour that he had received intimation of the loss of the Amazon by the previous mail, and had intended to have acquainted Miss Talbot with what he had heard; but, as he had hoped the missing pinnace might be heard of before the departure of the next packet, he had refrained from so doing. Now, however, that there seemed to be no doubt of Henry Talbot's fate, he entreated Miss Wardour to break the painful intelligence to Mary before she should learn it—as she soon must learn it—in a more abrupt manner. Miss Wardour, shocked as she was at the intelligence, willingly undertook the painful task, and went immediately to the farmhouse, taking with her the packet of newspapers which told the sad story of the loss of the Amazon.

When Miss Wardour had departed upon her errand, Mr. Aston took the rector aside, and, to Mr. Sinclair's great astonishment, acquainted him with the fact of his relationship to Mary Talbot.

He briefly explained the reasons wherefore he had kept the matter so long secret.

"You thought me eccentric, I dare say," he said, "when, during my sojourn in your house after the shipwreck, I was so reticent respecting the object of my visit to England. I wished to keep my arrival a secret.

I wished to surprise my relatives by appearing suddenly in their midst, like a man risen from the grave, or rather from the depths of the ocean. I was foolish enough to believe I should find things as I left them when a boy, forty years ago, and I was most bitterly disappointed. My old father, I thought, *might* have died; I found that my brothers also were dead, and that my sister had married and gone away from the paternal home, none knew whither. My time during my absence has been vainly employed in searching after this sister; but I could learn nothing beyond the fact that she had married a naval officer, against the wishes of her guardians, and had been most unjustly and cruelly treated in consequence thereof. Little did I imagine that I should discover the children of my poor sister in this remote village. I suspected that your young governess was my sister's child when I first heard her history from you; and I need not say that, when I found my suspicions correct, I was more than satisfied with her personal appearance and mental attributes. I kept my secret, however, until I should know her more intimately; but it was my intention to declare my relationship to Henry before he sailed for America. My sudden illness prevented me from so doing; and when I began to recover my health I still kept the secret from Mary. Now, however, I think the time has come when it is advisable to disclose it. There is, I fear, no doubt that the poor boy Henry has perished at sea; and it may be some comfort to my niece to learn that her brother's untimely death has not left her alone in the world, but that she has an uncle and cousins ready and anxious to receive her and comfort her in her affliction.

"I shall not see her to-day. It will be better to leave her with Miss Wardour until she has in some measure recovered from the shock of this painful intelligence. To-morrow I propose to go to her and tell her that I am her uncle Henry, her mother's favourite brother, and that henceforward she will find in me a second father, and in my son and daughter a brother and sister ready to love her.

"I desire still to retain my incognito, for reasons that you shall know hereafter. To you and your niece, and Doctor Pendriggen and Mr. Sharpe, who may know my secret, I will still be Mr. Aston. None others will know my real name until the time shall arrive when I think it advisable to disclose it."

Mr. Sinclair was equally surprised and pleased at this singular revelation. It explained much that he had thought strange and eccentric in Mr. Aston's conduct, and he sought to know no more until the time should come when the whole should be revealed. He, however, sympathised sincerely with Mary Talbot, and was truly glad to learn that she had a wealthy relation willing and eager to befriend her and comfort her amidst her sore trials.

CHAPTER XXV.—MARY TALBOT LEARNS THAT SHE HAS AN UNCLE AND COUSINS, HITHERTO UNKNOWN TO HER.

It is a common adage that "misfortunes never come single;" and though, like other vulgar adages, it is not always true, it is certainly very frequently verified. One mishap, or one evil deed, frequently generates another; and thus we are apt to attribute to some mysterious agency that which is but the natural result of cause and effect.

The evil that Mary Talbot had dreaded, ever since she had listened to the conversation in old Dame Hoolit's cottage, came to pass—came to pass on the very day on which the American packet arrived at Falmouth.

Dame Hoolit had related the story, which had been confided to her as a secret, to some neighbouring gossip, also as a secret; and so it had passed from one to another, until it reached the ears of the fishermen, who had for some time lain under the suspicions of Mr. Aston, and was soon known to every inhabitant of the village and parish.

The fishermen, eager to vindicate themselves, and angry at the very idea that such a base deed should be imputed to them, loudly asserted their innocence, and demanded that the matter, so far as they were concerned, should be thoroughly investigated. They did not hesitate to assert that, when they were called to the assistance of the sick gentleman, the young gentleman, "his nevey," who was standing by his side, had already unbuttoned his coat and loosened his neck-cloth; and to hint, pretty broadly, that he alone could have stolen the pocket-book, if it *had* been stolen by any one; and they called upon Jemmy Tapley to verify their assertions.

Great as was the esteem in which Mary Talbot was held by the majority of the villagers, there were many envious persons ready and eager to seize upon the first opportunity afforded to them to detect a flaw in her character, and to bring her down beneath their own level.

These evil reports were not long in reaching the Rectory, and coming to the ears of Mr. Sinclair and his niece. The rector had heard them while visiting among his parishioners, and on his return home he found Miss Wardour, just arrived from the farmhouse, where she had passed the day with Miss Talbot.

"How did you leave her, poor thing?" inquired he of his niece.

"Very sad, uncle," replied Miss Wardour. "She had so confidently expected a letter from her brother by the packet which arrived yesterday; and then, instead of the looked-for letter, to hear this news! I would have remained with her all night, but she wished to be left alone; so I told Mrs. Lawton to pay her every attention, and came away, promising to call early to-morrow."

"My dear Sarah," said Mr. Sinclair, "since you have been absent I have heard something which has alike pleased and astonished me, and also something which has caused me much annoyance."

Mr. Sinclair then told his niece the story he had heard from Mr. Aston, greatly to the young lady's surprise and delight; but, before she had much time to express her astonishment, he related the rumours he had heard in the village respecting the theft of Mr. Aston's pocket-book.

"But surely, uncle," said Miss Wardour, "you do not attach any credit to these rumours? The very idea that such suspicion rested upon her brother would crush Miss Talbot; and just now, especially, poor thing."

"I do not, Sarah," replied the rector. "Dr. Pendriggen, Mr. Sharpe, and myself are alike convinced that Mr. Aston lost his pocket-book in Falmouth the day before that on which he was taken ill; and I am inclined to believe that *he* also holds to the same opinion. But he is just one of those men who, once having made an assertion, will adhere to it rather than acknowledge themselves to have been in error. What confirms me in this belief is Mr. Aston's unwillingness to allude to the subject of his loss."

"But surely, uncle," said Miss Wardour, "he will not continue thus obstinate when he hears that his nephew is suspected of the robbery?"

"I hope not, my dear," replied Mr. Sinclair. "I

think not. Mr. Aston, as we must still style him, is a man who will listen to reason; and I have no doubt that he will be ready to do anything to clear the characters of his niece and his lost nephew, and also to satisfy the fishermen that he entertains no suspicion that they are guilty of so base a crime."

"Poor Mary!" said Miss Wardour. "All sorts of trouble seem to have come upon her at once;" and with this she turned away to attend to some household duty.

That evening Mr. Sinclair visited Cliff Cottage, and acquainted Mr. Aston with the rumours which were afloat in the village.

Mr. Aston was greatly annoyed.

"Mary must not know of these rumours," he said, "or if she has heard them, she must be informed immediately that none of her friends entertain any such suspicions. Poor child! She has sorrow enough to bear just now;" and he empowered Mr. Sinclair to acquaint the fishermen that he was perfectly satisfied of their innocence of the robbery.

"And let it also be known," he added, "that I *may* have been mistaken in my assertion that the pocket-book was in my possession when I was suddenly seized with illness. Poor, dear Mary—anything rather than she should have fresh trouble thrown upon her just now. At all events I will see her to-day. I dread, and yet I am anxious for the interview. Poor, dear girl. She shall hear from my lips, after I have declared my relationship, that I exonerate her brother from the slightest suspicion. It is a mystery, but it will be cleared up in the course of time."

As soon as Mr. Sinclair had left him, Mr. Aston went to the farmhouse.

Mary Talbot had hardly recovered from the fit of weeping to which she had given way on the departure of Miss Wardour, when there came a gentle tap at her door, and Mr. Aston entered her little parlour.

Approaching towards the sorrowing girl, he took her hand, and in a gentle tone of voice said—

"Mary, I have come to condole with you on your great loss, and also to ask pardon for my conduct when I last visited you. You must accord me your forgiveness, my dear, for I, like yourself, am a mourner. I mourn the loss of a nephew, as do you the untimely fate of a brother."

He hesitated a few moments, as if he scarcely knew how to explain the object of his visit, and then went on—

"My dear Mary, you have heard your mother speak of her youngest and favourite brother—your uncle Henry? I am he. Your uncle stands before you, anxious to claim you as his beloved niece, and to afford you such comfort as he may in your severe affliction."

For a moment Mary fancied that her visitor was insane. There was terror in the glance she cast upon him. But the next moment she recollected the numerous acts of kindness he had shown her and her brother—the manifest interest he had taken in her from the date of her first introduction to him, until his last visit—the searching questions he had put to her from time to time, which had frequently caused her to wonder what object he could have in putting them. All these manifestations of interest flashed vividly to her recollection. Then his voice and manner were gentle and earnest. She seemed to feel that he had spoken truly; and she remembered how often her mother had spoken of her brother Henry, who had left his home when a boy, and was supposed to have been lost at sea. Often had she heard her mother wonder if Henry were really dead, or whether he might not some day turn up again, and return to England to surprise his friends, as one risen from the

dead, until these speculations had grown fainter and fainter as years passed away, and she had said with a sigh, whenever she alluded to the subject, "No. Poor Henry is really lost to me, or he would have never remained absent and silent for so many long years."

The last time she had heard her mother speak of this long-lost, much-loved brother, the only playmate of her early childhood, was soon after her father was lost at sea.

Mrs. Talbot was lying in bed, propped up with pillows, and, as Mary thought, asleep—when suddenly she opened her eyes and murmured to herself—

"Ah! If poor Henry had lived, I should have no anxiety for the future worldly welfare of my dear children. Long after all others believed him dead, I hoped, and looked for his return. But it is too long ago. Forty years! He will never return now!"

"Can it be possible," thought Mary, as these recollections recurred to her, "that my poor mother's long-lost brother—my long-lost uncle Henry, now stands before me?"

She gazed for a few moments intently into his face. Then, actuated by an uncontrollable impulse, "Uncle!" she exclaimed, and as she sprang up from her chair was caught in her uncle's arms.

In an instant, however, she withdrew herself.

"It cannot be," she said. "You are deceiving me. Your name is Aston?"

"My name is Morton, my dear niece," was the reply. "I assumed the name of Aston—the name of my deceased wife—in order that, unsuspected by any one, I might find the relations—my sister especially—whom I came from America to seek. I have kept it until now, that, unknown to you, I might watch over you. Mr. Sinclair has heard my story; and now, my dear Mary, the time has come when I think it necessary to make myself known in my proper character to *you*. You are not alone in the world, my love. You have an uncle who will—were it only for your dear departed mother's sake—be in future all that your father could have been had he lived."

Mary doubted no longer. Her uncle's earnest, compassionate gaze, the tone of voice in which he spoke, more than his words, carried conviction to her heart, and with a faint cry she yielded herself to his embrace, and wept tears of mingled sorrow and gladness on his breast.

He soothed and comforted her for awhile, as he might have soothed and petted a sorrowing child; and for the moment she seemed to have forgotten her sorrows, in the new and unexpected source of consolation that was opened to her. Presently, however, the recollection of her brother's loss returned to her, and—at that moment more painful still—the recollection of the terrible suspicion that her newly-found uncle entertained.

Releasing herself from his embrace, she drew back to her seat, and, still standing, strove to speak; but though her lips moved, they were unable to frame the words she wished to utter. Her colour went and came, and her limbs trembled and tottered to that degree, that, but for the support of the table, which she nervously clutched with one hand, she would have sunk to the floor. She gasped for breath, and the room seemed to swim around her.

Mr. Aston (as I must still continue to style the returned Henry Morton) surmised the cause of her distress. Approaching towards her, he gently seated her in her chair, and then, seating himself by her side said, quietly and tenderly—

"You wish to speak, my dear niece, of our last inter-

view in this room, when I behaved so rudely—so unkindly. For that fault I ought to have apologised ere now. But I was surprised, and I—I—”

He hesitated as though he knew not how to proceed; but Mary had now found words.

“You saw the locket you had lost in my possession,” she murmured, still almost inaudibly. Then, gathering courage, she went on. “I—I had not then even heard of your loss; and Henry—oh, sir, it is strange, very strange; but if—if you had known my poor brother, as I have known him from his childhood, you—”

“Would believe him incapable of crime,” he kindly interrupted, “as *you* do, and as *I* do. Yes, my dear Mary, I will not, cannot think evil of—of him whose memory is dear to us both, and who is not here to vindicate himself, and prove his innocence. I will, I *do* believe that there is some strange mystery connected with this matter, which will in due time be revealed.”

“It will, it *will*,” murmured Mary. “Oh, thank you, thank you, uncle, for those kind, generous words. Henry *is* guiltless of this crime. I feel it *here*,” and she placed her hand on her heart.

“I can speak of the locket now,” she continued, after a brief pause. “Uncle, I will bring it here,” and, rising from her seat, she brought forth the trinket from her writing-desk and placed it in Mr. Aston’s hand.

“It is more fitting that the trinket should remain in your possession, my dear Mary,” replied her uncle.

“It once belonged to your grandmother, and afterwards to your mother, my love. Your dear mother gave it to me to keep for her sake, when she was a little girl, and I was but a few years older than she, as the most valuable of her treasures. Little did either of us think at that moment that we were about to part for ever in this world.

“It is a family heirloom, and I have treasured it carefully amid all the vicissitudes of my life; now it is but right that it should descend to you.”

He then proceeded to point out to her the coat of arms and the motto beneath; but though he meant kindly, Mary keenly felt that he had destroyed the hope that had lightened her heart when the thought had first struck her, that, since Mr. Aston’s crest and her own grandfather’s were so similar, it was reasonable to suppose that there might have been two lockets in existence, each engraved with a similar crest and motto.

He did not destroy her firm belief in her brother’s innocence, but he rendered one reasonable explanation of the manner in which the trinket came into her brother’s possession untenable, and deepened the mystery that surrounded the affair.

She, however, candidly related, word for word, as nearly as her memory served her, all that had passed between herself and Henry on the evening of his return from London.

“None of his actions betrayed a consciousness of guilt,” she said at last, “and, strange as things appear, I am as satisfied of poor Henry’s innocence in this matter, uncle, as I am conscious of my own.”

“We will never allude to the matter again, my dear,” replied Mr. Aston, “until the mystery, in which I am sure it is involved, is revealed. That, some day, it will be revealed, we will both hope—not only for poor Henry’s sake, but for our own satisfaction.

“Now, my dear, put the locket aside. Treasure it as a *souvenir* of your brother, and as an heirloom that has descended to you from your grandmother, till the day shall arrive when we can examine it again together.”

Mr. Aston then related to his niece the story of his early

career; told how he had been shipwrecked ere he had been forty-eight hours from home; how he had been confined for many months in a French prison at Montauban, from whence he had escaped and made his way on foot through France, and got on board a vessel bound to Portugal, whence he had sailed to India, and subsequently wandered over half the world, ever intending to return to England; how, in course of time, his desire to return grew weaker and weaker, till he finally resolved that he would never return, unless as a rich man, though he had always retained a fond recollection of his sister Mary, her mother. Then he told how he had come to settle down in the Far West of America, and had married and become the father of a family, and had gradually increased in wealth, until he became rich even beyond his hopes and expectations. He spoke of his son and daughter, still living in America, though his wife and four of his children were dead; and told how, at length, he had yearned so strongly to return to his home and friends, that he at last embarked for England from New York, and had been shipwrecked on the coast—a second time—in the bay near by; and how grievously disappointed he had been when he discovered that his brothers were dead, and that his sister had gone away from her native village, none knew whither; and how, after searching for months, in vain, for tidings of his sister, he had come again to St. David, as if directed by the finger of Providence, to find his sister’s child.

Many things he left to be told on future occasions; but as Mary listened with interest to his eventful story, and with especial interest to his description of his far-distant American home, and of the cousins still living there, of whom she had never heard until now, she felt herself beguiled from her grief, and when at length he parted from her for the night, he left her with a lighter heart than, but a few hours before, she had thought she would ever again bear in her bosom.

CURIOSITIES OF LAMBETH.

BY JOHN TIMBS.

I.

THE large parish of Lambeth, nearly eighteen miles in circumference, has in its history many strange things worthy of note. Its ancient archiepiscopal palace is a museum of antiquities in itself; while every portion of the parish abounds with that nook-and-corner interest which yields a plentiful crop of curiosities. Yet, change has been busy in this suburban district. Lambeth was anciently a village of Surrey; and, two centuries ago, it retained much of its rural character in its arable, pasture, and meadow lands, and its osier, garden-ground, and wood. It ranges along the south bank of the Thames from Vauxhall towards Southwark, and extends to Norwood, Streatham, and Croydon; it also included part of the Forest of Oak, called Norwood, belonging to the See of Canterbury, wherein was the Vicar’s Oak (cut down in 1679), at which point four parishes meet. This famous oak bore mistletoe, which some persons cut for the gain of selling it to the apothecaries of London, leaving a branch to sprout out; but some proved unfortunate after it, for one of them fell lame, another lost an eye! At length, in the year 1678, a certain man, notwithstanding he was warned against it upon account of what others had suffered, adventured to cut the tree down, and he soon after broke his leg; all which disasters are recorded in the “Magna Britannia,” of Lysons.

The name of Lambeth has been variously written at different times. The earliest mention of it is in a charter

of King Edward the Confessor, dated 1062, confirming several grants to the Abbey of Waltham, in Essex. There it is written *Lambe-hithe*. Most etymologists trace the name to *lam*, *dirt*, and *hythe*, a *haven*. Dr. Ducarel derives it from *lamb*, a *lamb*, and *hythe*, a *haven*; but that eminent antiquary, Dr. Gale, derives it from its contiguity to a Roman road, or *leaman*, which is generally supposed to have terminated at the river at Stangate, whence there was a passage over the Thames. Here the foundations are completed of St. Thomas's Hospital, which, it will be recollected, is to be built on the ground reclaimed by the southern embankment of the Thames.

In the earliest historic times the greater part of modern Lambeth must have been a swamp, overflowed by every tide, and forming a vast lake at high water. The Romans embanked the Thames on the south side, and did something towards draining the marsh. Roman remains have been discovered in St. George's Fields and at Kennington; and some antiquaries have thought that it was among the Lambeth Marshes that Plautus got entangled after his victory over the Britons, and that he retired thence to the strong entrenchment still to be traced near Bromley. The great Roman road from the south coast at Newhaven, through East Grinstead to London, entered Lambeth at Brixton, crossed Kennington to Newington, and there divided; the eastern branch going to Southwark, and the western across St. George's Fields to Stangate Ferry. The first of these roads is preserved to this day in Newington Causeway. In 1016, Canute laid siege to London, and, finding the east side of the bridge impregnable, conveyed his ships through a channel (Canute's Trench) dug in the marshes south of the Thames, so as to attack it from the west. Maitland, in 1739, imagined he had succeeded in tracing this canal; and in 1823, in excavations between the Fishmongers' Almshouses and Newington Church, some piles and posts were discovered with rings for mooring barges; also a pot of coins of Charles II and William III. A parishioner, aged 109 years, who died early in the present century, remembered when boats came up the "river," as far as the church at Newington.

A few years later, in 1041, Hardicanute, the last of the Danish Kings of England, died suddenly at Lambeth; though others place it at Clapham, which may then have formed part of Lambeth. It was the seat of Osgod Clapa, a Danish nobleman, at the marriage feast of whose daughter, Gytha or Goda, with Tovi Prudham, another noble Dane, Hardicanute was a guest; and, says the "Saxon Chronicle," expired with a tremendous struggle, as he stood drinking—not without suspicion of poison. A popular holiday commemorated this event for many generations, by a feast called Hock Tide, and the churchwardens' accounts at Lambeth show entries, till 1566, of sums gathered at these festivals, and applied to the repairs of the church. The Germans, to this day, call a wedding feast *hochzeit*, hock tide; and hock tide sports are still kept up in parts of Wiltshire and Berkshire.

According to William of Malmesbury, after the death of King Edward, Harold, the son of Earl Godwin, placed the crown on his head with his own hands, at Lambhythe.

In Domesday there are mentioned for Lambeth twelve villans, twenty-seven bordars, a church, and nineteen burgesses in London, and wood for three hogs; and the value of the manor is stated at £11. It passed, after sundry changes, to Bishop Gundulph, of Rochester, who taxed it with an annual supply of 900 lampreys, and his

successor demanded, in addition, a yearly salmon to be caught, of course off the Thames boundary; just as offerings of salmon from the Thames were anciently made upon the high altar of St. Peter's at Westminster.

In 1197, the manor of Lambeth came by exchange into the hands of the Archbishop of Canterbury, with whom it has remained ever since, except from the deposition of Laud, in 1640, till the Restoration of Charles II, in 1660. The present palace is the manor-house and, with the gardens and ground, forms an extra-parochial district. Its history has already been narrated in this journal, together with its curiosities. Archbishop Howley expended some £60,000 in restoring the fine old place. As Archbishop, he crowned three sovereigns, George IV, William IV, and Queen Victoria, and his consecration was witnessed by Queen Charlotte, when her Majesty was seventy years of age.

The Lollards' Tower and the Gate House are the oldest portions of the palace. At the gate, the *dole*, immemorably given to the poor by the Archbishops of Canterbury, is distributed. It consists of fifteen quartern loaves, nine stone of beef, and five shillings worth of halfpence, divided into three equal portions, and distributed every Sunday, Tuesday, and Thursday, among thirty poor parishioners of Lambeth; the beef being made into soup, and served in pitchers. Among the treasures of the palace are—the library, left to Lambeth for "the service of God and his Church, and of the kings and commonwealth of this realm;" the MSS. (some exquisitely illuminated), and the records and letters of undying interest; the gloomy prison-tower, and the noble two-storied hall *louvre*; the armorial glass; the pictures, not forgetting the Archbishops' portraits, and their chronological wigs; the priests' ancient habit; the Coronation Service-book, and Aggas's rare View of London in Queen Elizabeth's reign; the descendants of Pole's fig-tree; the shell of Laud's aged tortoise; and the solemnity of the palace gardens.

Near the palace gate was the Ferry, granted by patent to the Archbishop of Canterbury, it seems in 1750, when Westminster Bridge was opened.

St. Mary's (the mother church) has a perpendicular tower, with a beacon turret. Here sleep many archbishops beneath stately tombs. Thirleby, the first and only Bishop of Westminster, died a prisoner in the palace, and was buried here; his body was discovered wrapped in fine linen, the face perfect, the beard long and white, the linen and woollen garments well preserved, with the cap of silk and point-lace, slouched hat, cassock, and pieces of garments like a pilgrim's habit. Here lies Ashmole, the antiquary; and in the churchyard, the Tradescants, father and son,

"Those famous antiquarians, that had been
Both gardeners to the Rose and Lily Queen,"

beneath an emblematic tomb, sculptured with palm-trees, hydra and scull, obelisk and pyramid, and Grecian ruins, crocodile, and shells. In one of the church windows, the Pedlar, with his pack and dogs, is said to represent the person who bequeathed "Pedlar's Acre" to the parish; but it is rather thought to be a *rebus* on the name of Chapman, and to have nothing to do with the bequest. Beneath the church walls, Mary, Queen of James II, found shelter with her infant son, after she had crossed the river by the Horseferry from Westminster; here the Queen remained a whole hour on the night of December 9th, 1688, until a coach arrived to convey her to Gravesend, whence she sailed for France. Among the notabilities in the old burial-ground, near the High Street, was the Countess de la Motte, who figured in the mysterious story of the Diamond Necklace, and

the Queen of France, before the French Revolution. And in the parish register is recorded the interment of the venerable Dr. Andrew Perne, who is reported to have changed his religion four times within twelve years. Dr. Perne was Deau of Ely; he resided at Stockwell, a village of Lambeth. The neighbourhood was celebrated for game of all sorts, and Queen Elizabeth granted to Dr. Perne a license "to appoint one of his servants, by special name, to shoot with any cross-bow, hand-gonne, hasquedent, or demy-hack, at all manner of dead-marks, at all manner of crows, rooks, cormorants, kytes, puttocks, and such like bustards, wyld swans, barnacles, and all manner of sea-fowls, fen-fowls, wild doves, small birds, teals, coots, ducks, and all manner of deare, red, fallow, and roo."

Lambeth had formerly some noble mansions, as Norfolk House, where lived the Earl of Norfolk, in the time of Edward I; and where resided the celebrated Earl of Surrey, when under the tuition of Leland the antiquary. The site and ground are now occupied by Norfolk Row and Hodges' Distillery, removed here from the site of the Millbank Penitentiary, in 1812. Here are stills, varying from 500 to 3,000 gallons; a steam-engine of twenty horse-power, to work the machinery; and large glass air-tight cisterns, to receive the produce of the distillation; and here is an iron cistern to hold many thousand gallons. The Dukes of Norfolk had also in Lambeth, on the banks of the Thames, a garden, let to one Cuper, who decorated it with fragments of the Arundelian Marbles, given to him by his former master, the Earl of Arundel, whose gardener Cuper had been. These sculptures were afterwards buried in a piece of ground adjoining, along with rubbish from the ruins of St. Paul's Cathedral, then rebuilding by Wren; but the sculptures were disinterred, and the site let to Messrs. Beaufoy, for their vinegar works, which, on the building of Waterloo Bridge, were removed to South Lambeth, the site of the mansion and deer-park of Sir Noel Caron. Here, among Beaufoy's works, we read of a vessel of sweet wine, containing 59,109 gallons, and another of vinegar, of 56,799 gallons, the lesser of which exceeds the famous Heidelberg Tun; yet English tourists gaze at the tun, ignorant that they have a greater wonder at home. Mr. Beaufoy was an eminent mathematician; with his wealth he built and endowed schools for the poor, and presented to the Corporation of London a valuable collection of Tradesmen's Tavern Tokens, to be seen in the library at the Guildhall.

Another noted Lambeth mansion was Carlisle House, the palace of the Bishops of Rochester, until it was granted by Henry VIII to the See of Carlisle. Here, in 1531, Richard Roose, or Rose, a cook, poisoned seventeen persons by throwing some poison into a vessel of yeast; for this he was attainted of treason, and boiled to death in Smithfield, by an *ex post facto* law passed for the purpose, but repealed in the next reign. Carlisle House was not taken down until the year 1827.

Belvedere House was a noted pleasure-haunt, and upon part of the site and gardens were established, in 1785, the Lambeth Waterworks, first taking their waters from the borders of the Thames; then from its centre, near Hungerford Bridge, by a cast-iron conduit pipe forty-two inches in diameter; whence, in 1852, the works were removed to Seething Wells, Ditton, twenty-three miles by the river-course from London Bridge. Thence the water is supplied by the Company's reservoirs at Brixton, ten $\frac{3}{4}$ -miles distance, by steam-pumping engines, at the rate of 10,000,000 gallons daily. From these reservoirs, 100 feet above the Thames, the water

flows by its own gravity through the mains; but, at Norwood it is lifted by steam-power, 350 feet, or the height of St. Paul's Cathedral, above the supplying river. ("Curiosities of London," new edit. 1868.) In Belvedere Road, named from the old mansion, is the Lion Ale Brewery, built in 1836: the upper floor is an immense tank for water, supplying the floor below, where the boiled liquor is cooled; it then descends into fermenting-tuns, in the storey beneath, next to the floor for fining; and, lastly, to the cellar or store-vats. Belvedere Gardens adjoined Cuper's Gardens; and upon the site of the former was a saw-mill erected in the time of Cromwell, and which he protected by Act of Parliament from the violence of those who dreaded the invention. Curiously enough, almost upon this very spot are now erected some of the largest saw-mills in this country.

In Lambeth Marsh, or near to it, resided one Thomas Bushell, a man of scientific attainments, and a friend of Lord Chancellor Bacon. He obtained from Charles I a grant to coin silver money, for the purposes of the King, when the use of his mint at the Tower was denied to him. When Cromwell assumed the Protectorate, Bushell hid himself in an old house in the Marsh, which had a turret to it. Here in a large garret, extending the length of the premises, Bushell lay concealed upwards of a year; he hung the apartment with black; at one end of it was a skeleton extended on a mattress, and at the other was a low bed, on which Bushell slept; while on the dismal hangings on the wall were depicted several emblems of mortality. After the Restoration, Charles II supported Bushell in his inventive dreams; he died in 1664, aged eighty, and was buried in the little cloisters of Westminster Abbey.

At Vauxhall formerly stood Copt Hall, a house of historic interest. In 1615 it was built by Sir Thomas Parry, Chancellor of the Duchy of Lancaster, to whose close custody in this house was committed Lady Arabella Stuart, on account of having married privately William Seymour, grandson of the Earl of Hertford. This lady was the only child of the fifth Earl of Lennox, uncle to King James I, and great grandson of King Henry VII. Her double relationship to royalty was obnoxious to the jealousy of Queen Elizabeth and the timidity of James I, who equally dreaded her having legitimate issue, and prevented her from marrying in a suitable manner. The lady was kept in custody at Copt Hall, and Seymour was sent to the Tower. They both escaped the same day, 3rd of June, 1611. He got to Flanders, but she was taken in Calais Roads, and committed a close prisoner to the Tower, where she became a lunatic, and died in the Tower, 27th September, 1615 (Tanswell's "History of Lambeth.") Copt Hall was surrendered to Charles I, and was subsequently described as Vaux Hall: it contained "modes and utensils for practical inventions;" and after the Restoration there was allowed to settle here one Jasper Calthoff, a Dutchman, who was employed in making guns and other warlike instruments for his Majesty's service; shortly after, part of the premises was occupied by a sugar-baker; and next a large distillery was built here. There was a tradition that this house, or the neighbouring one of Vauxhall, was the residence of Guy Fawkes; but there is no mention of him as an under-tenant on the records. A family named Vause, or Vaux, had been inhabitants of Lambeth for nearly a hundred years; but, had Guy been their relation, and known to them (as he must have been had he inhabited a capital house at Vauxhall), he could never have thought of passing for a servant to Percy, who lived at Lambeth (as did John Wright, one

of the conspirators), and from whose house some of the combustibles were conveyed across the Thames to the Horseferry, and placed under the Parliament House, Westminster. The house in which the conspirators stored their combustibles was certainly at Lambeth, and near the river side; it was merely hired for this purpose in 1604, and was probably occupied by Catesby and Percy; it was "burnt to the ground by powder in 1635."

THE QUEEN'S JOURNAL.*

I.

ROYAL GEORGE SAILING YACHT.

In due time we hope to see a "People's Edition of the Queen's Book." Reviews and newspaper extracts have made the general contents pretty widely known; but the present price limits the possession of the volume to comparatively few. We should like to see a copy in every English home; for it is a book worthy of higher use than satisfying the curiosity of the idle and affording pleasure to the wealthy. We want it as a help to the education of the people—their education in what is true and good in life, and in what is beautiful in nature and art. Above all, it is a book the influence of which will be felt in fostering the love of hearth and home, and in strengthening those domestic and social ties that form the true defence and glory of our native land.

In this view the keynote to the work is struck in the brief and touching dedication, "To the dear memory of him who made the life of the writer bright and happy." With no ambition of authorship, and no display of royal state, the pages of this book are really what they call themselves, "Leaves from the Diary" of a happy wife and fond mother.

Under ordinary circumstances this private journal might never have gone beyond the circle of the writer's home; but happily it has been otherwise ordered. The Queen has been pleased to tell to the great body of her subjects the story of her domestic life, writing simply and freely of her joys and sorrows, her tastes and occupations, her feelings and sympathies. The people now know the truth about many things of which they had

before only vague though generally correct surmises. And this confidence on the part of the Queen has been met by a love and loyalty which will be increased the more the book is known.

The volume is divided into three parts:—"Earlier Visits to Scotland," "Life in the Highlands from 1848 to 1861," and "Tours in England and Ireland, and Yachting Excursions." They possess different degrees of interest. To many the first will appear the most charming, since it takes us back to the younger days, to the married girlhood of Queen Victoria, when, released for a while from the ceremonies and adulations of the capital, she went to Scotland to catch a first glimpse of its wild and brilliant landscape, of its ancient and lofty cities, of its population, aglow with loyalty, hospitality, gaiety, and independence. This was in the autumn of 1842—six-and-twenty years ago—a distance of time often touchingly referred to in later pages.

The journey was made from Windsor to London by rail, and by road to Woolwich, where the youthful sovereign embarked with her husband on board the Royal George, with a magnificent squadron as escort. The royal yacht was a very different ship from the Victoria and Albert of later years. The voyage was tedious, but thoroughly enjoyed by the Queen. "I saw Fern Island," she writes, "with Grace Darling's lighthouse on it." Singularly enough, that very morning Grace Darling lay dead in her cabin on the Northumbrian coast. The people at sea and ashore were giving merry and distant welcomes to the lady of the land just then passing, "fancy free," through their waters, dancing and piping in their boats, and kindling bonfires

SANDY M'ARA AND THE DUKE OF ATHOLE.

* "Leaves from the Journal of our Life in the Highlands from 1848 to 1861, with Extracts giving Account of Earlier Visits to Scotland and Towns in England and Ireland." Smith, Elder, and Co. Our illustrations of the Athole country are from sketches by Robert Taylor Pritchett, made during visits to Blair Castle, and now reproduced with the sanction of the Duchess of Athole. In some of the other pictures (to appear in our next part), Mr. Pritchett has found assistance in photographs taken by Wilson, of Aberdeen.

on their hills; and the seamen tripped it upon deck, eliciting from her Majesty one of many amiable compliments to the naval service of her kingdom, "They are so handy and well conducted."

The Queen, from the outset, was enchanted with Scot-

land, with Edinburgh and its environs, with the architecture, the scenery, and the people. "The impression

thing built of massive stone: there is not a brick to be seen anywhere. The High Street, which is pretty steep,

what is even more, Albert, who has seen so much, says it is unlike anything he ever saw; it is so regular, every-

other side the Calton Hill, with the National Monument, Nelson's Monument, Burns's Monument, the Gaol, the

High School, etc., all magnificent buildings, and with Arthur's Seat in the background, overtopping the whole, form altogether a splendid spectacle. "Albert said he felt sure the Acropolis could not be finer; and I hear they sometimes call Edinburgh 'the modern Athens.'" The enthusiasm was very great, and the people very friendly and kind." Here she "saw several handsome girls and children with long hair; indeed, all the poor girls of sixteen and seventeen, down to two or three years old, have loose flowing hair, a great deal of it red." These, be it remembered, are the *naïve* observations of a Queen just twenty-three years old, visiting for the first time one nation of her subjects. And here the simplicity, as free from affectation as from egotism, of her disposition begins to show itself. They dined, and "everybody was very kind and civil, and full of inquiries as to our voyage." Next morning the young Monarch tastes oatmeal porridge and Finnon haddock, finding both to be sufficiently good. Then there were trips and parties, and rides and drives, and visits to castles and villages, and to the fishwomen, "generally young and pretty—very clean and very Dutch-looking;" and a Drawing-room, and addresses from provosts and magistrates, churches and universities, "to which I read answers. Albert received his just after I did mine, and read his answers beautifully." It was all a triumph; no shadow of care in these young days.

But in that early time, Victoria, already accustomed to regal state, proved that she looked with interest upon whatever appertained to the history of kings and queens in her dominions. Her pilgrimages were made to Holyrood, "that royal-looking old place;" to Dalhousie, "where no British Sovereign had been since Henry IV;" to the Crown Jewel Chamber at the Castle; to the room in which James VI of Scotland and I of England was born—"such a very, very small room, with an old prayer written on the wall"—to Loch Leven, near the castle whence "poor Queen Mary escaped;" to the mound on which "the ancient Scottish kings were always crowned;" to "the old arch with James VI's arms;" to the "sycamore tree planted by James VI," and to the age-blotted leaves of the book from Perth, "in which the last signatures are those of James I of England and of Charles I." The Queen and Prince Albert were asked to unite their names beneath those historic signatures, and did so. With these exceptions, there is hardly anything in the volume to remind us of its writer's paramount station in society—unless we take such phrases as the following, in allusion to Lord Breadalbane's chivalrous welcome:—"It seemed as if a great chieftain in olden feudal times were receiving his Sovereign."

It was her out-of-door life, however, that the young Queen chiefly enjoyed—the mountain scenery, the woodland borders of the lakes, the songs of the boatmen on the waters, the glens and hamlets, and glimpses of shepherd manners on the brown slopes. In all this she luxuriated, and records a deep regret when, in little more than a fortnight, her back was turned on Scotland, and her face set in the direction of Windsor Castle. It had been, practically, the first freedom of her life. The next visit was made about the same season, two years later. The journal begins:—"We got up at a quarter to six o'clock. We breakfasted. Mamma came to take leave of us; Alice and the baby (Prince Alfred) were brought in, poor little things, to wish us 'good bye.' Then good Bertie (the Prince of Wales) came to see us, and Vicky (the Princess Royal) appeared as *voyageuse*, and was all impatience to go." The eldest-born of our Queen seems to have been, from the beginning, an excel-

lent traveller. "I said to Albert, I could hardly believe that our child was travelling with us—it put me so in mind of myself when I was 'The Little Princess.'" We quote these slight passages as exemplifications of the perfectly natural tone in which her Majesty describes her earlier experience. "We got out at an inn," she writes, "which was small, but clean, at Dunkeld, to let Vicky have some broth. Vicky stood and bowed to the people out of the window. There never was such a good traveller as she is, sleeping in the carriage at her usual times; not put out, not frightened at noise or crowds, but pleased and amused." Such are some of the pleasant glimpses, where the mother more than the queen appears.

Never did English tourist more heartily enter into all the delights of travelling in Scotland, nor more thoroughly appreciate the scenery of the

"Land of brown heath and shaggy wood,
Land of the mountain and the flood."

Thus, in Blair Athole she admiringly writes of the grand scenery:—

"Blair Castle, Blair Athole, Thursday, Sept. 12.

"We took a delightful walk of two hours. Immediately near the house the scenery is very wild, which is most enjoyable. The moment you step out of the house you see those splendid hills all round. We went to the left, through some neglected pleasure-grounds, and then through the wood, along a steep winding path overhanging the rapid stream. These Scotch streams, full of stone and clear as glass, are most beautiful; the peeps between the trees, the depth of the shadows, the mossy stones, mixed with slate, etc., which cover the banks, are lovely; at every turn you have a picture. We were up high, but could not get to the top: Albert in such delight; it is happiness to see him, he is in such spirits. We came back by a higher drive, and then went to the factor's house, still higher up, where Lord and Lady Glenlyon are living, having given Blair up to us. We walked on to a cornfield, where a number of women were cutting and reaping the oats ('shearing,' as they call it in Scotland), with a splendid view of the hills before us, so rural and romantic, and so unlike our daily Windsor walk (delightful as that is); and this change does such good: as Albert observes, it refreshes one for a long time. We then went into the kitchen garden, and to a walk from which there is a magnificent view. This mixture of great wildness and art is perfection.

"At a little before four o'clock Albert drove me out in the pony phaeton till nearly six—such a drive! Really, to be able to sit in one's pony carriage and to see such wild, beautiful scenery as we did, the farthest point being only five miles from the house, is an immense delight. We drove along Glen Tilt, through the wood overhanging the river Tilt, which joins the Garry, and as we left the wood we came upon such a lovely view—Ben-y-Ghlo straight before us—and under these high hills the river Tilt, gushing and winding over stones and slates, and the hills and mountains skirted at the bottom with beautiful trees; the whole lit up by the sun, and the air so pure and fine; but no description can at all do it justice, or give an idea of what this drive was. 'Oh! what can equal the beauties of nature!'"

Very touching is the gentle womanly way in which her husband is linked in all her enjoyments, Albert's delight, and Albert's remarks being always noted. Prince Albert was extremely fond of deer-stalking. Here is his own description of the sport, given in a letter to Prince Leiningen:—

"Without doubt deer-stalking is one of the most fatiguing, but it is also one of the most interesting of pursuits. There is not a tree or a bush behind which you can hide yourself. . . . One has, therefore, to be constantly on the alert in order to circumvent them, and to keep under the hill out of their wind, crawling on hands and knees, and dressed entirely in grey."

On many occasions the Queen joined the shooting-party, and has given the following account of a day in Blair Athole:—

"We drove nearly to Peter Fraser's house, which is between the Marble Lodge and Forest Lodge. Here Albert and I walked about a little, and then Lady Canning; mounted our ponies and set off on our journey, Lord Glenlyon leading my pony the whole way; Peter Fraser, the head keeper, (a wonderfully active man) leading the way, Sandy and six other Highlanders carrying rifles and leading dogs, and the rear brought up by two ponies with our luncheon-box. Lawley, Albert's jäger, was also there, carrying one of Albert's rifles; the other Albert slung over his right shoulder, to relieve Lawley. So we set off, and wound round and round the hill, which had the most picturesque effect imaginable. Such a splendid view all around, finer and more extensive the higher we went! The day was delightful; but the sun very hot. We saw the highest point of Ben-y-Ghlo, which one cannot see from below, and the distant range of hills we had seen from Tulloch was beautifully softened by the slightest haze. We saw Loch Vach. The road was very good, and, as we ascended, we had to speak in a whisper, as, indeed, we did almost all day, for fear of alarming deer unawares. The wind was, however, right, which is everything here for the deer. I wish we could have had Landseer with us to sketch our party, with the background, it was so pretty, as were also the various 'halts,' etc. If I only had had time to sketch them!

"We stopped at the top of the Chrianan, whence you look down an immense height. It is here that the eagles sometimes sit. Albert got off and looked about in great admiration, and walked on a little, and then remounted his pony. We then went nearly to the top of Cairn Chlamain, and here we separated, Albert going off with Peter Lawley and two other keepers to get a 'quiet shot,' as they call it, and Lady Canning, Lord Glenlyon, and I went up quite to the top, which is deep in moss. Here we sat down and stayed some time, sketching the ponies below, Lord Glenlyon and Sandy remaining near us. The view was quite beautiful—nothing but mountains all around us, and the solitude, the complete solitude, very impressive. We saw the range of Mar Forest, and the inner range to the left, receding from us, as we sat facing the hill called Scarsach, where the counties of Perth, Aberdeen, and Inverness join. My pony was brought up for me, and we then descended this highest pinnacle, and proceeded on a level to meet Albert, whom I descried coming towards us. We met him shortly after; he had had bad luck, I am sorry to say. We then sat down on the grass and had some luncheon; then I walked a little with Albert, and we got on our ponies. As we went on towards home some deer were seen in Glen Chromie, which is called the 'Sanctum!' where it is supposed that there are a great many. Albert went off after this, and we remained on Sron-a-Chro for an hour. I am sure, as Lord Glenlyon said, by so doing we should turn the deer to Albert; whereas, if we went on, we should disturb and spoil the whole thing. So we submitted. Albert looked like a little speck creeping about on an

opposite hill. We saw four heads of deer, two of them close to us. It was a beautiful sight.

"Meanwhile I saw the sun sinking gradually, and I got quite alarmed lest we should be benighted, and we called anxiously for Sandy, who had gone away for a

hills sharper. I never saw anything so fine. It soon, however, grew very dark.

"At length Albert met us, and he told me he had waited all the time for us, as he knew how anxious I should be. He had been very unlucky, and had lost

the scenery became more and more beautiful, the sky crimson, golden red and blue, and the hills looking purple and lilac, most exquisite, till at length it set, and the hues grew softer in the sky, and the outline of the

appoint him. We got down safely to the bridge, our ponies going most surely, though it was quite dusk when we were at the bottom of the hill. We walked to the Marble Lodge, and then got into the pony carriage and

drove home by very bright moonlight, which made everything look very lovely; but the road made one a little nervous.

"We saw a flight of ptarmigan, with their white wings, on the top of Sron-a-Chro; also plovers, grouse,

The arrival and reception at Taymouth are thus described:—

"At a quarter to six we reached Taymouth. At the gate a guard of Highlanders, Lord Breadalbane's men, met us. Taymouth lies in a valley surrounded by very

MARELE LODGE, GLEN TILT.

and pheasants. We were safely home by a quarter to eight."

Whenever the Queen paid a visit to any of the nobles of the north she was received with truly Scottish enthusiasm. Two of these state visits may be given as instances.

Here is the description of the reception at Inverary Castle:—

"Our reception was in the true Highland fashion. The Duke and Duchess of Argyll (dear Lady Elizabeth Leveson Gower), the Duchess of Sutherland, Lord Stafford, Lady Caroline Leveson Gower, and the Blantys received us at the landing-place, which was all ornamented with heather. The Celtic Society, including Campbell of Islay, his two sons (one grown up, and the other a very pretty little boy), with a number of his men, and several other Campbells, were all drawn up near to the carriage. We got into a carriage with the two Duchesses, Charles and the Duke being on the box (we had left the children on board the Fairy), and took a beautiful drive amongst magnificent trees, and along a glen where we saw Ben Sheerer, etc. The weather was particularly fine, and we were much struck by the extreme beauty of Inverary—presenting as it does such a combination of magnificent timber, with high mountains and a noble lake.

"The pipers walked before the carriage, and the Highlanders on either side, as we approached the house. Outside stood the Marquis of Lorn, just two years old, a dear, white, fat, fair little fellow, with reddish hair, but very delicate features, like both his father and mother; he is such a merry, independent little child. He had a black velvet dress and jacket, with a 'sporrán,' scarf, and Highland bonnet. We lunched at two with our host, the Highland gentlemen standing with halberds in the room. We sent for our children, who arrived during luncheon time. We left Inverary before three, and took the children with us in the carriage. The Argylls, the Duchess of Sutherland, and the others accompanied us on board the Fairy, where we took leave of them."

high wooded hills; it is most beautiful. The house is a kind of castle, built of granite. The *coup d'œil* was indescribable. Here were a number of Lord Breadalbane's Highlanders, all in the Campbell tartan, drawn

TAYMOUTH CASTLE, FROM THE FORT.

up in front of the house, with Lord Breadalbane himself in a Highland dress at their head; a few of Sir Neil Menzie's men (in the Menzies' red and white tartan), a

number of pipers playing, and a company of the 92nd Highlanders, also in kilts. The firing of the guns, the cheering of the great crowd, the picturesqueness of the dresses, the beauty of the surrounding country, with its rich background of wooded hills, altogether formed one of the finest scenes imaginable. It seemed as if a great chieftain in olden feudal times was receiving his sovereign. It was princely and romantic. Lord and Lady Breadalbane took us upstairs, the hall and stairs being lined with Highlanders."

The mention of the arrival at Taymouth leads to the introduction of the following simple and touching note:—

"I revisited Taymouth last autumn, on the 3rd of October, from Dunkeld (*incognita*), with Louise, the Dowager Duchess of Athole, and Miss MacGregor. As we could not have driven through the grounds without asking permission, and as we did not wish to be known, we decided upon not attempting to do so, and contented ourselves with getting out at a gate close to a small fort, into which we were led by a woman from the gardener's house, near to which we had stopped, and who had no idea who we were.

"We got out and looked from this height down upon the house below, the mist having cleared away sufficiently to show us everything; and there, unknown, quite in private, I gazed—not without emotion—on the scene of our reception twenty years ago by dear Lord Breadalbane, in a princely style not to be equalled in grandeur and poetic effect.

"Albert and I were only twenty-three, young and happy. How many are gone that were with us then!

"I was very thankful to have seen it again.

"It seemed unaltered.—1866."

WHAT I SAW OF THE AMBER TRADE.

ANY one wishing, from motives of curiosity, to live awhile in a bygone age, or rather, to learn from actual observation the way some people lived one hundred years ago, should visit the city of Königsberg, on the Prengal, in the eastern part of Prussia.

The people of that city move about as though they had not the slightest fear of being harmed by time or anything else, except by a little activity. The only thing new to be seen there is occasionally a new moon. Everything in the place looks antique. The children look as though they had been children for many years, and would be so for many years to come. The people, however, must have changed a little within the last three or four hundred years, for the present generation do not seem to have energy enough to accomplish the work man has at some time performed in completing so respectable an old city. The magnificent cathedral, containing the remarkable organ with 5000 pipes, and many other public buildings, show that its inhabitants were once young, energetic, and ambitious.

Only three days are required for "doing" Königsberg. To a person fond of travelling, a longer residence in the city will become somewhat wearisome—especially should he be in want of money. Being in the latter predicament, and also desirous of moving on, I did not find myself much in a fix at Königsberg. I am a seaman—one who follows that occupation as the most convenient way of travelling on an income limited to the wages of manual labour. Not wishing at the moment to leave that part of Europe, I joined a small vessel that was to be employed near the mouth of the Dange, in gathering amber.

A large and deep deposit of mud or soft clay, containing much amber, had lately been found not far from Memel, and we were employed to work upon it. Between Königsberg and the Frische-Haff we saw several places where people had been, or were digging for amber, although the work does not appear to be very profitable. The amber obtained in that way on those "diggings" only amounts to about 500 pounds per annum, and too much work is required in obtaining that amount to make the labour remunerative.

Two of my companions told me that they had spent several months in digging for amber, and had worked hard for a miserable living, until they had reluctantly been compelled to give up the business.

I asked, "Why reluctantly?" and learnt that the business could be followed only with the same infatuation that enslaves the gambler—the hope of making as much in an hour as can be made by saving the wages of some ordinary employment for years.

The day after leaving Königsberg we were anchored over that part of the mud-bank where the company had purchased the right of dredging, and were making preparations for work. We commenced business in a more extensive or scientific manner than dredging for amber had usually been performed. The dredging machinery was worked by a steam-engine, and the contents of the buckets were emptied into a barge alongside. Four men were stationed in the barge, employed in turning over the clay and other substances brought up in the buckets, searching for the amber.

I had an opportunity of seeing the result of our first day's work. It consisted of one piece of an inferior quality, weighing about three ounces, and worth about as many shillings. Several other smaller pieces were found, but were of little value, as they could only (I was told) be used for dissolving and making into a varnish principally used by photographers.

The price of amber varies according to size and quality of the pieces. A piece weighing but half an ounce, and worth two shillings, would probably be worth three or four times that sum if only double the weight. Some amber is so discoloured by substances that have adhered to and become mixed with it before being hardened, that it will not bring in the market more than four or five shillings per pound. Other pieces that are clear, or that can be used as specimens, containing insects preserved in perfect shape, are worth from £16 to £17 per pound.

The largest piece of which I heard, and which is said to be the largest ever found, was owned by a firm of amber merchants in Dantzic, who have long kept it in their possession; it weighs twelve pounds. The largest piece found in recent years near Memel weighs about five pounds, and it was said to be worth over 400 Prussian dollars.

The right of gathering amber on the east coast of Prussia was once monopolised by a company. This monopoly was extinguished in 1847, and since then the owners of land on the shores can confer the right of collecting it, although I believe a small fee has to be paid to the government. Dantzic was once the principal port for the trade in amber, but the business is now mostly centred at Memel. The trade in amber between England and Prussia is fast increasing. A few years ago, nearly all the amber reached us in a manufactured state, but now we receive the most of it as it is found on the coasts.

It is estimated that more than 74,000 pounds were procured by dredging in 1866. The amount last year was undoubtedly much larger. A good deal of amber is

obtained along the shore of the Frische-Haff by hand-dredging with small nets, and many people earn a living in this manner. They are always most successful after a violent storm, which has disturbed the bottom of the bay along the shore and exposed the pieces of amber to the action of the dredges.

While at work attending the dredge, I was enabled to obtain a little practical experience of the business of gathering amber. I learnt that it was hard, wet, and dirty work, for which those employed on wages were but poorly paid. At this, however, I could not complain, for it was no more than was expected when entering into the business. On the third day we were at work we were very successful. Nearly every bucket of dirt emptied into the barge contained several pieces of amber. We had found a part of the bank where a large quantity had been deposited, and that day we must have obtained nearly two hundred pounds. Many of the pieces were very clear and valuable. This was much the best day's work we had while I was on the dredge.

Had I been a rich man, I could have afforded to remain in that employment during the season, but being poor, I could not. The most to be gained in the business was a little experience with men and mud by day, and a knowledge of the game of "lansquenet" in the evening. These things were not worth suffering much and long to learn, and I determined to leave.

One day we were visited by the skipper of an English ship lying about a mile away, waiting for the turn of the tide. I prevailed on the skipper to give me a passage to Dantzie, and as but little objection was made to my leaving, I bade my gambling companions "goot tay," and left them.*

I believe that learned men have disputed much about the origin of amber. From the foreign substances contained in it, and from its occurring in connection with lignite or fossil wood, it appears to be a resinous exudation from ancient forests. As to its uses in commerce, I believe it is used in medicine, and in art for preparing varnish; and also for necklaces and other ornaments, of which the most known to me are mouthpieces of pipes.

Original Fables.

BY MRS. PROSSER.

EXCITEMENT.

Puff, puff, went the bellows.

Up went the flame.

Puff, puff, went the bellows.

The flame rose stronger and higher.

"Am I not bright, noble, genial?" cried the Fire.

"Burn away," said the Bellows, and stopped blowing.

The flame faded, and the ruddy light grew pale.

"So," said the Bellows, "I don't think much of *your* brightness; you can only burn while I blow. Give me the steady flame, that keeps strong and clear without the help of puffing."

* The annexed paragraph I have cut out of an English newspaper since my return:—The little fishing village of Schwarzwort, situated on the shores of the Baltic, between Memel and Dantzie, about two leagues to the south of the former place, has within the last three years acquired a certain importance, owing to the discovery of a large bed of amber. This bed is situated near the Cape Korning, and is believed to be extensive. Four steam dredges are employed for the collection of the amber, as well as a considerable number of dredges worked by hand. The amber is found almost uniformly in separate nodules, with lignite, disseminated in the sands at a depth of from ten feet to twelve feet. The dredging is carried on day and night, by shifts of eight hours each. About 400 persons are employed at this work, and their wages are, on the average, 22 silver groschen (2s. 2d.) per shift. The quantity of amber collected is considerable, amounting to about 288 lbs. per shift, and for six days' work 5,184 lbs. The sand is sent on shore, when it is washed in order to find the amber.

ABOUT CRITICS.

"Hold that poor, thin twitter of yours, Bob!" said the Raven to the Robin.

Bob generally took a good deal to be daunted; but he stood now half ashamed, till, recovering himself, he said, "Beg pardon, sir, I have been thought to sing like the nightingale here, by very good judges."

"Nightingale! A melancholy, woe-begone ditty she gives. Keep me from nightingales!" said the Raven.

"Ah, I see; you like something cheerful, sir—like this lark who has just come down, for instance."

"Lark! Insufferably monotonous," said the Raven.

"Oh, variety, then, is what you require; and here is the thrush; *she* is the songster for you!" said Bob.

"The thrush has good notes and variety, and is cheerful, I admit; but oh! so intensely *rustic* and familiar—absolutely vulgar!" said the Raven.

"Sir," said Bobby, with a waggish look, "I wish *you* would give us a song, that we might know what good singing really is."

The Raven sidled off, provoked and offended.

"He put us down when he never could do anything but *croak*! No, no, my friends, we won't stand *that*," said Bobby; and he set up one of his loudest twitters immediately.

PROVE YOUR PRINCIPLES.

"I wish I could open your eyes to the true misery of our condition: injustice, tyranny, and oppression!" said a discontented Hack to a weary-looking Cob, as they stood side by side in unhired cabs.

"I'd rather have them opened to something pleasant, thank you," replied the Cob.

"I am sorry for you. If you could enter into the noble aspirations——" the Hack began.

"Talk plain. What would you have?" said the Cob, interrupting him.

"What would I have? Why, equality, and share and share alike all over the world," said the Hack.

"You mean that?" said the Cob.

"Of course I do. What right have those sleek pampered hunters and racers to their warm stables and high feed, their grooms and jockeys? It is really heart-sickening to think of it," replied the Hack.

"I don't know but you may be right," said the Cob, "and to show I'm in earnest, as no doubt you are, let me have half the good beans you have in your bag, and you shall have half the musty oats and chaff I have in mine. There's nothing like proving one's principles."

REASON IS REASON, THOUGH NOT SEEN.

"Why shouldn't we go abroad for the winter, like the swallows, and lots besides?" asked the House Sparrow.

"Can't say, indeed," replied his friend.

"We are quite as numerous," said the Sparrow. "See what flocks we make."

"Quite," said his friend.

"And we have good wings, and we don't like cold weather and starvation any more than they do," said the Sparrow.

"True," said his friend.

"Then why *don't* we go abroad?" said the Sparrow.

"That's beyond me to explain," said the other; "but indeed, brother, though not very old, I have lived long enough in the world to see there are many things I can't account for; and when I meet with one like this, I make up my mind that the fault doesn't lie in its unreasonableness, but in my incapability of understanding it. By this rule, no doubt, the swallows satisfy themselves that it is right they should have to go abroad while we stop at home."

WHY THE LARK IS A FAVOURITE.

"I can't think what makes the Lark such a favourite," said the Robin to the Thrush; "he hasn't a feather that isn't dull or dingy. He's not to be compared with *me* that way."

"His feathers are well enough," said the Thrush, rather resenting the reflection on sober colours; "but I can't say I think his song worth the fuss they make about it. I should be sorry to change my notes for his."

"Friends," said the Lark, as he rose from behind them, "I will tell you what makes me a favourite. It is neither my dress nor my music in itself; but it is because I sing where few other birds sing, and am more the songster of the free air than any of you. You must have your covert, or your thicket, or your grove, or your brake, so that, as far as you are concerned, it is 'no bush, no bird;' but I am content with the hedgeless field, or bushless uplands, and send down my song full and free, from the heights of the cloudless sky, to cheer the wayfarer when he is out of the way of other music, and hopes for none."

HOW TO WORK.

"SUKEY you've got an easy life of it," grumbled the Pot to the Kettle; "sitting there like a lady all day long, with nothing to do but boil a little water and sing a pretty song."

"I do what is given me to do, and do it cheerfully," said Sukey. "One can but be employed, and you, when you are sputtering over your pudding or potatoes, and the Fryingpan, when he is spitting with his cakes, are on no harder service, really, than I am; but everything depends on the way you take work. *I sing over mine!*"

STRENGTH VERSUS CUNNING.

"POOH! you're not worth running after," said the Dog to the Plover, as he dropped his wing as if it were broken, and ran haltingly to lure him from the nest.

But the Plover flew on as the Dog closed on him, dropping his wing again, however, in a minute, and limping as before.

"Stupid work this!" said the Dog. "I shall be up to you now;" and he ran rather quicker, not doubting he could catch his prey when he had resolved to do it.

At length, after many feigned flights, the Plover, secure of his object, left the Dog in great dudgeon, while he pealed his whistle of defence, and took his long, wheeling flight over the moor, to return to the nest by another way.

"What a blockhead I was to be taken in by him!" said the Dog; "but how is an honest fellow with only one end in view to match an adversary that does one thing and means another?"

A TIME TO WEEP.

"You are very ungrateful to complain," said the Knife to the Hedge. "Don't you know that I am slashing away at you for your good? Why, every cut I give you will tell, and when spring comes you will be so gay in green leaves, that the birds will delight to build in you."

"Sir," said the Hedge, "in the spring, when my wounds are healed, I *will* thank you; but at present I am too much occupied with my smart to be able to rejoice in the prospect of green leaves."

FIT WORK FOR OWLS.

"MOTHER, what a fine house we live in!" said an Owlet, as he nestled with the old bird in the ivy on the castle tower.

"Yes, my son, it is a fine house," said the Owl.

"Did you build it, mother?" he asked.

"No, my son," she replied.

"Did your father build it?"

"No, my son, no; it was not *originally* built for owls. Once there was not a crack for the ivy to take root in, nor a chink to hold a nest."

"Oh, what a dull place it must have been then!" said the Owlet. "Who improved it to its present state?—the *owls*, I suppose."

"Yes, my son; I daresay it was the owls," his mother replied. "I should think none but owls would dream of turning a good sound building into a ruin, just to suit their own ends."

TROUBLE FOR NOTHING.

"SHINE out, mamma; don't you see how they twinkle at us?" said a young Glowworm to her mother.

"The stars, do you mean, my dear?" asked the mother.

"Yes, if you call them stars; they are staring at us finely," said the daughter.

"Bless your little heart!" said her mother; "do you think they can see *us*?"

"Why not? we can see *them*," replied the daughter.

"Because, my dear, their light is strong enough to travel to us, but ours is too feeble to be seen many yards from the earth. We might shine our hearts out, and the stars would never know we were in existence."

BENEATH TEACHING.

"YAC, yac, yac!" barked the little dog, as Lion and Nero walked through the yard.

"Yac, yac!" he cried again and again, running off, however, as soon as they looked at him.

"Give the impudent little brute a grip, to teach him," said Nero.

"I!" exclaimed Lion. "No, friend, when I fight, it is with dogs of breeding, not with puppies or mongrel curs."

Poetry.

SPRING.

SOFTLY in Winter's place,
Spring steals out on the earth and stands with half-frightened face;
For the frost smell still is keen and the wind is coarse and loud,
And the eddying snow-flakes fall from the edge of the full-filled cloud.

Lo, she is timid and young,
But nowhere in all the fields is heard one welcoming tongue.
Cold are the black marsh pools; in the wood on a lonely beech
Flutters the last of the leaves, red, ragged, and out of reach.

Nearer and yet more near
Every day does she come, and the low skies heighten and clear,
And change into fresh soft blue as when, in a glad surprise,
Eyelids are lifted up from the azure of innocent eyes.

Then, with a throb in the throat,
Up gets a robin and sings a sharp, blithe, twittering note;
Sudden he stops in alarm and flies to a tree in the lane,
Near to the house-door safe, and there he carols again.

All by himself at first;
But in a moment or two the thrush gives a wild out-burst,
Then join the ring-dove and finch, and the little hedge-wren
chirps fast,
For Winter, black Winter is gone, and Spring has come to them at last.

Straight to the thrill of the sound,
Primroses push thro' the moss that cumpers the moistened ground,
And the forget-me-nots spread far thro' the thick, wild brake,
With violets voicelessly glad—so glad for the dear Spring's sake.

Widely, in woodlands brown,
Greeten the tiny buds, and the tender leaves hang down,
Blossoms the guelder rose, and the lilac's purples unfold,
Mixed with the heavy drip of the yellow laburnum's gold.

Early, with early sunrise,
Eager with tremulous joy, flutter the butterflies,
And to the twinkling stream the gnats and the midges come,
And the bee goes by on the wind with solemn approving hum.

Spring, no longer afraid,
Walks with a soft low laugh on thro' the sun and the shade,
Colours the rose on the wall, fills all the flowers with scent,
Then in the eventide rests in a calm content.

Oh, to be wise as Spring!
Gentleness conquers at last every stern, dark thing;
Mercy wins on its way; Patience is strong and sweet;
Faith with these three combined brings the world to our feet.

Look then to One above:
God who gives us the Spring gives us also his Love,
Strong in its sunny warmth—which, touching the cold dead soul,
Calls it at once to life, and some day will perfect the whole.

THE LEISURE HOUR

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cowper.*

LANDED AT NEW ORLEANS.

THE MORTONS OF MORTON HALL.

CHAPTER XXVI.—IN WHICH HENRY TALBOT LEARNS, TO HIS ASTONISHMENT, THAT, ACCORDING TO ALL LOGICAL CONCLUSIONS, HE MUST HAVE PERISHED AT SEA.

EARLY one morning, about three months after the Amazon sank beneath the waters of the Mexican Gulf, a fishing-sloop landed, upon the levée* at New Orleans, a party of pallid, cadaverous, wretchedly-clad

* The river at New Orleans rises above the level of the city, and consequently an embankment, boarded with planks, has been raised around it. This embankment, at which vessels load and discharge their cargoes and passengers, is termed "the levée."

creatures, ten in number, of whom five were males and five females—all of whom appeared as if they had recently risen from a sick-bed. Some staggered with weakness as they stepped from the sloop's deck to the shore, and the entire party, when they had collected together, looked about them with an air of indecision, as if they knew not what to do, or where to betake themselves to.

A crowd of idlers, comprising negroes, mulattos, French and Spanish creoles, interspersed with a few southern Yankees, collected together and stood gazing upon them with mingled compassion and curiosity, until

at length some of the more curious began to question them as to whence they came, whither they were going, and what had brought them to their present abject and destitute condition.

These were informed in reply, that the party consisted of a portion of the crew and passengers of the American packet-ship *Amazon*, who had escaped from the sinking ship and had been landed on the island of St. Domingo.

"We numbered eighteen when we landed," said a young man (the youngest, but healthiest-looking of the party), who acted as spokesman for his miserable companions; "but the captain of the ship, who was with us, and seven others, one of whom was a lady, have since died of fever, with which we have been all struck down. I had the lightest attack; for some of my companions have not yet recovered their strength, as you may perceive."

"Heow long hev yer been on the island, stranger?" inquired a tall western Yankee, who had forced his way into the crowd.

"About three months, as near as I can tell. I can't say to a day—hardly to a week."

"What on airth med yer stop *thar*, friend?"

"Simply because we were unable to get away."

"Why didn't you go tew yer consul? S'pose yer hed a consul?"

"No. The island is in a condition of anarchy and confusion: there is scarcely a white person residing on it; and if we had been French, the probability is that, wretched as we were, we should all have been massacred by the negroes and mulattos, who just now look upon all white people with suspicion, and upon the French with absolute hatred."

"Oh, yew'm bin alonger them 'ere niggers who'm sot up for theirselves, es I've heerd on. Heow did ye dew to fix yerselves when ye wor all deown wi' fever, stranger?"

"We did badly enough, as you may perceive from our looks. However, we found some compassionate people even among the negroes, and those among us who recovered from the fever, lived as we could—some days starving; other days living upon vegetables and fruits, sometimes catching a few fish, until at length the captain of a Savannah fishing sloop touched at the island, and took pity upon us, and offered to carry us to New Orleans."

"And what air yer goin' to dew now yer yere? Hev ye got any money?"

"A few dollars among us, that were made up by the captain and crew of the sloop and some of the people on the island."

"Waal, friends, I calculate ef you'm got money, ye'll find some folks es 'll be willin' tew take yer in, and fix up suthin' fur yer to eat, though yer dew look es skeery a lot o' critters es ever I see. Ef yer like tew foller me I'll show yer whar yer kin get took in till yer kin see yer consul, which I reckon yer'd best dew 'soon's yer kin. Them wimmen-critturs don't look es ef they kin stand much more knockin' beout; and es fur es a dollar or tew goes, I don't mind helpin' feller-critturs in such a fix es yew air."

"Eout o' the way, yer grinnin' niggers," cried the stalwart Yankee, forcing a passage through the crowd of mulattos and creoles; and, bidding the party follow him, he led the way through a number of dirty backstreets, until at length he stopped at the door of a restaurant, kept by a stout, middle-aged French creole woman, one "Madame Bidaud," whose name flourished in gaudy yellow letters over the front of the coffee-house.

"Hey, yew, Ma'am Bido," said the Yankee, hailing the good-tempered looking, brown-complexioned mistress of the establishment, whose gaudy attire appeared in strange contrast with the dingy, dark, dirty room into which the party were ushered by their new friend. "Yew fix up suthin' good, and plenty on't, right tew onest, fur these yere miser'ble critturs, an' sot it deown to my 'ceount, and then see un' git the wimmin folks comferble tew bed."

"Oui, M'sieu," replied Madame Bidaud, smiling all over her round, fat face. "Viens, mes pauvre dames—asseoiyez vous pres le feu," she added, addressing the women, when she was interrupted by the Yankee, who cried out—

"Come, yew Marm Bido, jist shet up that air lingo an' talk good 'Merican, es folks kin onderstand. Yer *kin*, arter a sorter fashion, yer know, and be smart and fix up suthin to eat."

Madame Bidaud replied in negro English, intermingled with creole French—a jargon almost equally unintelligible to the majority of the party, as had been her original speech—that she would hasten to do the Yankee's bidding, for the sake of "de poor massas and mesdames dareselves," when one or two of the party interposed, and said that, poorly off as they were, they were able to pay for a breakfast.

"Yew jist shet up neow," answered the Yankee. "Marm Bido knows me, she dew, an' she'll jes' dew es I tell her, an' no tew words 'beout it. I'm Abiram Billings, I am, from Carr'lton, on the Mississip'. What's *your* name, friend? I'm teold yer mine," he inquired of the young man who had been the spokesman of the party.

"Henry Talbot," was the reply.

"Waal, then, Master Tallboots, yew jist tell yecour folk to take keer o' thar money. I dessay they arn't got tew plenty on't. I reckon they *ain't*. Mebbe they'll want it all afore they die. I'm been hard up myself afore neow, I hâve, an' hedn't nought tew chuse atween, but a red Injin and an alligator, many's a time."

"And yew take my advice, young man. Sune es yew've hed suthen tew sot yer up, and the wimmin critters hes been made comfer'ble, yew jist h'ist up yer consul, and tell him es it's his bounden dewty fur tew look arter ye."

Abiram Billings remained until Madame Bidaud had set a comfortable breakfast before the party, when he insisted upon settling the score, there and then, and then took himself off.

Before, however, Henry Talbot could take Mr. Billings's advice, and seek out the British consul, the news had got noised through the city (which, at the period to which this history refers, was a much smaller, and a very different place from the New Orleans of the present day), that a party of sailors and passengers from the lost ship *Amazon* had landed on the levée, and betaken themselves to Madame Bidaud's; and they had scarcely breakfasted ere they were visited by several of the citizens, among whom were the editor and reporter of one of the newspapers.

Again Henry Talbot became the spokesman of the party, he being the only male passenger (the other men were common seamen.)

"Look'e here, mister. What's your name?" inquired the editor, after the young man had briefly narrated the sufferings of the party in the pinnace, after they had landed at St. Domingo.

"Henry Talbot."

"Waal, look'e here, Mister Talbot. This here story

o' your'n may be very true. Mindye, I don't say es it ain't. But it ha'n't a good look wi' it. The Amazon, wi' all aboard, 'cept tew boat's crews, were reported tew be lost. Ain't it so, feller-citizens?" addressing himself to the bystanders, who nodded their acquiescence.

"Waal, now, lookye. Tew put it logical. The Amazon bein' reported tew be lost, and all on board, or, as *were* on board, 'cept tew boat-loads, and won boat bein' found bottom up, and the pinnace never heerd on from then till now, and them fac's bein' duly reported in the noospapers, es yew, respected feller-citizens, air well awar', I say it don't look well fur the pinnace's crew, wi' no less than *five* of the ladies as were believed tew be drowned, tew turn up *now*. 'T'aint 'cordin' tew the natur' of things, arter it's been duly reported in the noospapers, for this pinnace's crew, and 'specially the ladies, which gave interest tew the report, tew turn up at this time o' day."

To this proposition there was a general murmur of assent,* and the editor continued—

"My noospaper, sir, the 'Lone Star of Trooth,' has published a full and akerate report of your loss, describin', in affectin' terms, heow you and these ladies perished at sea, and that report hev gone forth *tew* the world."

"You have but to deny that statement, and say that you are happy to say that the pinnace of the Amazon, supposed to have been lost, with all on board, in the Gulf, happily reached the island of St. Domingo, and that——"

"Never, mister, *never*!" interrupted the editor. "Never shall it be said as the 'Lone Star of Trooth' denied what it once asserted. My repootation 'ud be gone; my circulation 'ud be ruined, and my political opponent, the 'Platform of Virtoo,' would gain an advantage which I should never hear the last on."

"Then you need not, I presume, say anything about us?"

"And allow my political opponent to squirt over a piece o' noos, es he'd hev no hesitation in sayin' I never heerd on! No, sirée, I regret to say as I hold it my dooty tew sacrifice my private feelin's in the cause of the public, and declare yer to be an impostor. The majority of our citizens, sir, believe your folks to be lost, and *I* and *you* must conform tew the opinion of the majority, which air the basis of all trooth. My friend, I reckon you'll may hap be fur travellin' up country? In such case, let me warn you not to tell es you've been rescoted to any of eour people; they wun't stand it, mister—they wun't *stand* it."

With this the editor and his friends took their departure, and Henry, fearing another visit from the editor of the "Platform of Virtoo," hastened to the British consul's office, and acquainted that functionary with the arrival from St. Domingo, and the urgent distress of himself and his companions.

Fortunately the consul took a different view of the matter from that entertained by the editor. He listened attentively and pitifully to the young man's account of the sufferings that he and his companions had endured, congratulated him upon his and their escape, and promised them immediate assistance. Before the day closed, the ladies were removed to a respectable hotel; and the consul having learnt from Henry that it was his

wish to proceed westward up the Mississippi river, in search of employment from friends whom he hoped to find at St. Louis, provided the young man with the means of carrying his object into effect.

The sailors, who were Americans, applied to the mayor, and were sent home to their friends in the Northern States; and Henry, after having bidden farewell to his companions in suffering, soon set forth on his journey.

The morning after his arrival, however, the "Lone Star of Truth," (more to the amusement than to the vexation of himself and the ladies), devoted a whole column to demonstrate that, according to every logical axiom, the crew and passengers of the late ship Amazon having perished at sea (with the exception of those who had landed from two of the ship's boats on the Island of Cuba), it was morally and physically impossible that any of the said crew and passengers who had quitted the ship in the pinnace could have survived; therefore, it stood clearly proved that any person or persons pretending to have been a portion of the said crew and passengers must be impostors, whatever assertions might be made to the contrary. On the other hand, the "Platform of Virtue" devoted a leading article to show that the editor of the "Lone Star of Truth" was a conceited blockhead, who invariably jumped to false conclusions, and added that he not only congratulated the surviving crew and passengers of the pinnace on their happy escape from the niggers, but also hoped that he should yet have to congratulate the crew of the boat that had been found bottom up, upon their escape from the dangers of the deep. "In fact," he wrote, in conclusion, "we should not be greatly surprised if some of these days the Amazon herself were to make her appearance in port, if it were only to prove the utter fallacy of every assertion that has appeared in the "Lone Star of Truth."

The citizens of the then comparatively small city took different views, according to the papers which they patronised; and Henry and his friends found themselves the objects of so much alternate compassion and reproach that they were heartily glad when they were enabled to escape from the place.

CHAPTER XXVII.—IN WHICH HENRY TALBOT EMBARKS ON A VOYAGE UP THE MISSISSIPPI, AS FAR AS ST. LOUIS.

UNDER very different auspices from those which he had so confidently and proudly anticipated, Henry Talbot commenced his travels in America.

The few letters of introduction given to him by Mr. Aston (those of the most importance, Mr. Aston's sudden attack of illness had prevented him from giving) had sunk with the Amazon, and he had forgotten the names of many of those to whom they had been directed. He remembered, however, the name of the New Orleans merchant, who had acquainted Mr. Aston with the loss of the Amazon; but when he called at this gentleman's office, he learnt that the merchant and his family, as usual at that (the sickly) season, had left the city, and were travelling in the Northern States. He at length bethought him of the name of a merchant in St. Louis, to whom also he had had a letter of introduction, and he determined at once to proceed to that city, and try what good fortune might yet be in store for him. For some time he had hesitated whether or not to write to his sister, but he had decided in the negative.

"Mary," he thought, "will have heard of the fate of the Amazon ere now. She will have got over her first great sorrow at my supposed loss, and if I acquaint her

* The author intends no disrespectful allusion to the citizens of New Orleans, nor to the editors of the newspapers of the city of the present day, the New Orleans journals being *now* among the ablest and best conducted in the Union. But the New Orleans of the date to which this story refers had but lately become a city of the United States, and the majority of its inhabitants (otherwise than the French) were of a class similar to those which, at a later period, occupied the state of Texas, adjoining the state of which New Orleans is the capital.

with my present destitute condition I shall only cause her fresh sorrow and anxiety. I will wait until fortune smiles upon me, when I shall be able to write cheerfully."

There was, perhaps, more of pride than of a desire to save his sister from anxiety in the young man's determination, since he well knew that Mary would rejoice to hear that he was still living; but be that as it may, he quieted his own conscience with the pretence that he was saving the feelings of his sister, to whom he was really ashamed to write how low his hopes had fallen.

Thus it happened that, on the sixth day after his arrival at New Orleans, he embarked on board a flat-boat (steamboats had not yet made their appearance on the Mississippi) bound for St. Louis—a distance of more than twelve hundred miles—his sole wealth consisting of a scanty outfit, and the few dollars, barely sufficient to defray the necessary expenses of the journey, presented to him by the British consul.

Still, blank as his future appeared, different as were his present prospects from his former bright anticipations, he was hopeful and cheerful with the buoyancy of youth.

The voyage at least possessed the charm of novelty, although in other respects it promised to be far from an agreeable one.

The boat, possessing few accommodations, was crowded with passengers, consisting chiefly of settlers from different parts of the South-west, who had been to New Orleans to dispose of the produce of their "clearings," or of the spoils of the chase during the preceding winter, and to purchase the few simple necessities required in their isolated, half-savage mode of living.

Broad as is the Mississippi (the Great Father of Waters), it is very shallow for a considerable distance above New Orleans. Poles and oars were in constant requisition to keep the boat from grounding; and thus fourteen days were expended, ere Natchez—only three hundred and twenty miles above the mouth of the river—was reached. The muddy water, the gloomy forest-skirted banks, on which only a few wretched hovels, inhabited by fishermen, were to be seen, rendered this portion of the voyage monotonous in the extreme.

Beyond Natchez, however, the scenery became more picturesque. The woods rejoiced in the genial warmth of a Southern sun. The deep green of the grass of the yet early spring, and the light, silvery hue of the maple trees, contrasted with the darker shades of various pines; red and white fruit-blossoms peeped out from the thickets of copsewood; birds of gorgeous plumage flew to and fro from branch to branch; and from countless wild flowers a delicious perfume was wafted on the gentle breeze.

Still, the lack of any signs of human life was remarkable. Now and then, as before—at wide distances apart—some fisherman's or pilot's hovel might be seen, deeply embosomed in the woods, and some few children would come occasionally down to the banks to watch the boat as it floated by, and to shout after it as long as it remained in view. More rarely still, an Indian encampment might be observed, the squaws busied in cooking or basket-weaving, while their dusky lords lounged idly in front of the wigwags, or stood scowling upon the shore; and now and then a canoe would put off, generally paddled by squaws, who pertinaciously offered their wares for sale to the passengers.

These signs of human life were, however, few and far between. Frequently, for days together, the boat passed on her solitary way over the turbid stream, between silent forests, apparently deserted to the prowling

wolf, since the last of the Powhattans fled to their retreats in the distant West.

No sound of busy axe awakened the echoes of the glens; not a tree appeared to have been hewn for ages; not a branch lopped off. The seed fell and took root: the young plant grew until it became a hoary denizen of the forest, and time at length withered its branches and decayed its trunk; a blast of wind laid it prostrate on the ground, where it rotted away, until scarcely a difference could be discerned between it and the huge, scaly alligator which crouched in the mud by its side.

Such was a voyage up the Mississippi forty or fifty years ago, and the aspect of things is not greatly changed at the present day, only that now-a-days snorting, high-pressure steamboats have replaced the slow-moving flat-boats, which in former times solely enlivened the scene. But now, as then, there is a strange contrast between the life and bustle apparent on the northern rivers, and the dreary solitude which prevails on the waters of the lower portion of the mighty Mississippi.

Five or six hundred miles up the river, however, the scene was changed. Then planters' dwellings became numerous on either shore. Fishing-boats, manned by chattering negroes, dotted the stream, sometimes moored to the "snags" or trees that have washed off from the shore, and having become embedded at one end in the mud, saw, as it were, to and fro, and up and down, and greatly impede and endanger navigation. There was no longer one unbroken line of forest on both shores; but wide clearings were to be seen, cultivated with cotton bushes, amidst which hundreds of negroes of both sexes and all ages were at work, and all was life and activity.

Now the passengers began to disembark, and others to take their places. There are no quays or piers on the western streams; the boats, therefore, go on shore into the soft mud banks, a plank is laid between the deck and the shore, and the passengers scramble up and down the bluffs as best they may.

Still the passengers continued to be, with few exceptions, of the same class—a very different people—almost, it would seem, a different race, from the passengers who throng the boats on the northern rivers; hunters from the yet unbroken forests of the Far West; young farmers from the newly-settled districts, and a few dandies, the sons of wealthy planters.

The style of costume embraced all the strange variety of Mississippi fashion. The backwoodsmen wore their leather hunting-shirts and fringed leather pantaloons, looking like Indians, and almost as dark-coloured, by the effects of sun and weather; the farmers were clad in home-made garments of antique cut, and of butter-nut colour, while the young planters appeared in all the glory of blue coats, white trousers, straw hats, and patent-leather boots. All, however, were prodigal of strange oaths, all chewed tobacco incessantly, and used the deck as one vast spittoon, and all divided their time equally between gambling, whittling, and drinking and sleeping, while there were few among them who were not armed with either pistols or bowie-knives, which they appeared ready to display, and to use, on very slight provocation.

It must not, however, be supposed that Henry Talbot met on board the flat-boat with a fair specimen of the white society of the South. He, like many other travellers, was at first inclined to form an erroneous idea of the planters, and others among whom he was about to cast his lot, from the persons he met with during the voyage, being then unaware of the fact that the wealthiest and more refined inhabitants of the South do not throng the great highways of land or water, but lead a

quiet, and, it must be said, generally inactive life, in their country houses.

At length, after a passage of nearly a month (now frequently accomplished, notwithstanding the numerous stoppages, in a week), the flat-boat on board of which Henry Talbot had taken passage drew near St. Louis—the enterprising and growing capital of the West.

For some days before, there had no longer been any cause of surprise or complaint at the solitude of the Mississippi. The river was thronged with flat-boats, barges, and sailing craft of every description, as it is at the present day with steamboats; some crowded with passengers bound down and up the mighty stream; some laden with cotton or with general produce; some about to force their way to the very source of the Missouri, and to penetrate into solitudes as yet unvisited by the white man. A restless eagerness seemed to have taken possession of the people—a desire to seek something—to accomplish something, as yet unheard of. A hundred years before, the surrounding country—the great valley of the Mississippi—was penetrated by the Spaniards, who, however, accomplished little more for its civilisation than had the wandering aboriginal tribes. The French succeeded, and still the great Father of Waters continued to flow through a solitude, from its source among the Rocky Mountains, to its mouth at the “delta” of New Orleans. Then, however, the valley fell under the dominion of the Anglo-Saxon race, and, as if by magic, the face of nature underwent a change. Merely rang the woodman’s axe through the hitherto silent forest, and amid the wild brushwood brakes; villages started into existence, where solitary wigwags had alone formerly occupied the sites; the planter laid out his cotton-fields, the sugar-cane rose tall and green amid the charred stumps of forest trees. The lonely hunters and trappers were driven to more distant fields, and the Indians retired gloomily and savagely to the distant wilds of Arkansas, to bide the time, not far distant, when all of their race shall be gathered to their fathers, and the aborigines of a vast hemisphere shall only live in the traditions of the past.

Very soon, the boat drew alongside the wharf at St. Louis—then a small city in comparison with what it is now, but then, as still, the emporium of all the vast country bordering on the Missouri and central Mississippi.

Almost as penniless as when he landed at New Orleans, though somewhat better fed and better clad, Henry Talbot strolled through the narrow, inconvenient streets, lined chiefly with wooden houses, but thronged with adventurers from all parts of the Union, all absorbed in the one great object in their eyes—the desire to improve their fortunes. The busy hum of trade and barter was incessant. It was scarcely possible to stroll through the streets without becoming infected with the eager spirit of gain that possessed the inhabitants of every class.

At the period of which I write, St. Louis was what St. Paul, Minnesota, and other cities of the still farther west, have since become—the resort of adventurers of every description, utterly reckless, often unprincipled, careless whither they went, thinking of nothing, caring for nothing, but the one great object of gain which had brought them from their homes and families in the north, the south, the east, to found new homes in the western wilderness.

St. Louis has since become a large and opulent city, of one hundred and fifty thousand inhabitants, and is continually increasing in extent and worth. It has now a large permanent population of wealthy

merchants and traders, and possesses all the requirements of a great metropolis; yet still there is a restlessness in its people that the traveller cannot fail to mark, and which he will not have seen in its intensity until he has arrived at the great nucleus and present emporium of the Far West.

The young Englishman soon found out the residence of the merchant to whom Mr. Aston had given him letters of introduction, and whose name he fortunately remembered. He introduced himself, and told his sad story; and, though he was at first regarded with some suspicion, and keenly questioned and cross-questioned, he was at length believed, and employment was soon provided for him. But he had already learnt that his expectations of fortune were not likely to be so quickly realised as he had anticipated, and that, in America—the land of enterprise and industry, *par excellence*—life may be a long struggle with poverty and hardship, if the adventurer bring nothing with him but mere intelligence, and be without knowledge of any special craft or calling. The knowledge he had acquired at Eton was of no value to him whatever in this far-western district of the new world, nor was the little experience he had gleaned in the lawyer’s office of much greater benefit. Utterly unacquainted with trading or book-keeping, and untrained to any description of manual labour, he was of little real service to his employer, who, however, continued to retain him in his office, for the sake of his friend Mr. Aston, until the young man himself, finding his occupation distasteful to him, and feeling desirous of more active employment, determined, at the expiration of three months, to seek his fortune farther north. Having contrived to save a little money, he at length acquainted the merchant with the object he had in view.

“What do ye think of doing to benefit yourself, young man?” inquired the merchant.

“Anything I can find to do that I am competent to perform,” was the reply.

“Well, young man,” said the merchant, “ye arn’t o’ no partecklar use to me, that’s a fac’. Your folk ought to have brought ye up more ‘cute afore they sent ye out west. I s’pose in the first place ye’ll be huntin’ up Mr. Morton’s folk?”

“Mr. Morton’s folk!” exclaimed Henry.

“What am I am thinkin’ on?—Aston I mean, in course. You’ll be huntin’ them up?”

“I was to have had letters to them,” replied Henry. “Mr. Aston had prepared them for me, I have every reason to think, on the very day on which he was seized with sudden and dangerous illness. He was on the point of speaking of his home and his son and daughter. In fact he had already mentioned their names, when he became speechless. I almost think that I should have gone to them direct from New Orleans had I known where to find them; but I know nothing of them except that they live on the western shore of Lake Michigan.”

“Well, I kin tell ye where to find ‘em,” continued the merchant; “and ef Mr. Mor—Mr. Aston, I mean—was goin’ to give you letters, I s’pose there’s no harm in d’rectin’ ye. I’ve been thinkin’ ye might find employment as ‘ud suit ye on the lake. Ye arn’t much fit for a countin’ house, but you know figures, and you’d do very well for a purser on one o’ the lake boats. Watertown’s the name of the place where they live; and as ‘tarn’t fur from Milwaukie, I’ll give ye letters to a foo o’ the cap’ens o’ the lake vessels, and mayhap ye’ll git a berth from one or t’other on ‘em. And now ye’ll be wantin’ your pay, I s’pose?”

Henry replied that he should be glad to receive the small amount of salary due to him, and the merchant, with the generosity frequently met with among Americans, added to the trifling sum a parting gift of fifty dollars.

A few days afterwards the young Englishman bade farewell to the friendly merchant, and set forth on his second journey through what was almost the extreme west of the settled portion of the North American continent.

This time, however, he chose to travel by land, though, had he been so minded, he still might have followed the windings of the vast Mississippi river as far as Fort Crawford—only a hundred miles westward from the south shore of Lake Michigan.

LIFE IN JAPAN.

III.

DRESS AND APPEARANCE.

PECULIARITIES of costume always strike a traveller's eye, and the Japanese have certainly a style which is all their own. Women of the lower class wear a long loose dressing-gown sort of garment, that folds in front; a broad girdle is passed round the waist, and fastened in an immense bow behind. The hair is dressed very carefully, and in a peculiar fashion, which will be afterwards described, and the feet are covered with cotton-cloth stockings, made like an infant's glove, the great toe being separated from the others. This makes the foot somewhat resemble a cloven hoof when thrust into the sandals, which are only worn out of doors, and put off on entering a house, that the matted floor may remain unsullied. These sandals are held on the foot by a soft leather band, which passes over the instep and inside the great toe; the sole is composed of leather, shod with iron under the heel, and a layer of beautifully fine-plaited bamboo, on which the foot rests. Men, women, and children all wear sandals of the same pattern, differing only in size and quality. Men and women also in wet weather put on high patens of wood, plain or lacquered; they must be very dangerous to walk in without great practice, and yet they are in constant use, even when the snow lies on the ground. Ladies wear many petticoats, with trains as long as those prescribed in the year 1867 by European modistes. In fact, the latest fashions from Paris seem inspired by Japanese tastes, the high chignon, the silken bow tied behind, and long narrow petticoats, being all seemingly copied from Japanese costumes. In out-of-doors dress the colours are quiet, great attention being paid both to harmony and contrast. The prevailing hues are grey, black, and dark-blue for the dress, and brilliant crimson and rose colour for the scarves which encircle the waist. Silk and cotton materials are chiefly used, and beautiful fabrics are manufactured from the former product. Extraordinary labour is taken with one kind of scarf, made of a loosely-woven crape. Before being subjected to dyeing, it is caught up at regular distances in pyramidal twists; when it has been passed through the dye-pot, the twisted parts are left white, and a curious parti-coloured, almost elastic tissue is the result of the process.

At home most gorgeous garments are worn, with very striking patterns, and the ingenuity of the designer must be as severely taxed as in Western countries to invent new ones. But the circumstance which makes Japanese ladies look most strange is, that so many of them have black teeth, and are without eyebrows; when

the mouth opens for a smile, a yawning black chasm is seen, made uglier by the deep red colour of the painted lips. These great disfigurements have, however, a meaning, and are the tokens of matrimony. Every married woman, instead of wearing a golden circlet on her finger, makes herself hideous as a matter of course; it is, perhaps, to prove that she loves but one, in whose eyes she ought to be beautiful under any circumstances. Her blackened teeth and face, rendered meaningless by the absence of eyebrows, are a passport to her everywhere, and she is permitted the utmost freedom of action. Until they undergo this voluntary disfigurement, Japanese women are, as a rule, very pretty, and even this alteration does not altogether destroy the charm of their appearance and manner. The teeth are blackened by a mixture of steel filings; every day they are cleaned with a powerful tooth-powder, and the mixture re-applied. Custom has wonderful influence; but we think that young English ladies would ponder a long time before uttering the "Yes" which must be followed by such a transformation.

STYLE OF DRESSING THE HAIR.

Like all Eastern women, our sisters in Japan take great pains with their hair, disposing it in large loops and bows, drawn off the face, and gathered in a chignon behind. The colour is a glossy black, and it is smoothed with a bandoline, made by placing the shavings of the *Uvario Japonica*, a creeping plant, in water; a mucilaginous liquid is produced resembling a decoction of quince seed, and this serves to prevent the hair becoming rough and disordered, which is of special importance, as no covering to the head is worn out of doors in fine weather. Individual taste is not suffered to determine the style of dressing the hair, except in the matter of ornament, it being always arranged in the same fashion. The glossy black of the hair contrasts with the bright coloured pins and flowers which are placed in it; the brilliant scarlet pomegranate, the bright tinted azalea, the delicate white Cape jasmine, and the primrose-hued *lar-mai*, are all used to adorn the jetty tresses of the Japanese ladies. The pins are mostly made of white glass filled with coloured water, generally of a golden sherry tint; they stick out from the head, and remind one somewhat of a *cheveaux-de-frise*. Some years since, combs and ornaments made of glass, filled with various chemical preparations, such as sulphate of quinine, etc., through which the electric spark was flashed, were exhibited in some of our scientific institutions. The idea of filling glass ornaments for the hair with coloured preparations was novel to Europeans; but in the Far East these fragile ornaments have been in use for a long time. Of course, accidents will happen, and a lady may easily lose a large portion of her head-gear by a fall. That the coiffure may not be disturbed during sleep, the head is placed on a small pillow of flexible bamboo.

PAPER.

This is an article of the greatest utility to our sisters in Japan. Not only do they use paper fans, paper pouches, and paper lanterns, but also paper pocket-handkerchiefs, paper umbrellas, paper waterproof cloaks, paper walls, paper windows, and paper string. When a collection of the different kinds of paper was made, to be sent to the Exhibition of 1862, no less than sixty-seven varieties were forwarded; and, in fact, without paper to turn to a thousand and one different purposes of use and ornament, Japanese life would be at a standstill. So necessary is it, that a stipulation is always made in the

marriage contract that the bride shall receive a certain allowance of paper.

The Japanese obtain it from a different source from our own. Instead of old rags being converted into clean paper, they make use of the bark of the *Broussonetia papyfera*, stripped, dried, and then steeped in water till the outer green layer comes off. It is boiled and rendered quite soft, beaten to a pulp, and then two other kinds of bark are added, one to make it tough, and the other glutinous; the latter is often the bark of the *Sane Kadsra* or *Uvaria Japonica*, a creeping plant, which has already been mentioned as the plant which the Japanese women use to make bandoline. The whole is then well mixed, and spread out in thin sheets on matting frames, and dried. It is cheap, four sheets of the ordinary quality being worth about one farthing. It is a paper that does not tear evenly; some kinds are tough—more like cloth. When required for string, it is deftly twisted into a strong twine, which in some cases is made of part of the paper forming the wrapper. The paper used to cover the framework walls is quite thin and can easily be torn, so that privacy is very difficult of attainment.

When oiled, it is made into waterproof clothing, or stretched on a neatly constructed bamboo frame and used as an umbrella. One kind is manufactured to assume the appearance of leather, and is made into tobacco-pouches, pipe, and fan-cases. The conjurors use a kind of white tissue paper in the famous butterfly trick, when a scrap, artistically twisted, hovers over a paper fan with all the fluttering movements of the living insect.

ABYSSINIAN NOTES.

WHATEVER other results may follow the Abyssinian expedition, we are certain to obtain much knowledge of the physical geography, geology, and natural history of the country. The Royal Geographical Society is represented by Mr. Clements Markham, who has communicated valuable reports on the districts hitherto explored. Before the war is over, and the country evacuated, we may hope to have ample and accurate knowledge of the land and people of "Ethiopia."

The following extracts from Mr. Markham's reports describe some of the places mentioned in the narratives of the expedition from the coast to the interior:—

At Annesley Bay he says that the sea is very shallow for some distance from the shore, and the spring tides rise so as to cover a considerable area of the low land, which, near the beach, has a slope of one in four hundred. The ordinary rise and fall of the tide is four feet six inches. The plain looks green from the anchorage, and when it is clear there is a magnificent view of the Abyssinian Alps. The ridges appear to rise one above the other in a succession of waves. On landing, the illusion as to the greenness of the plain is dissipated. A sandy plain overlying the clay extends from the sea shore to the mountains. It is intersected by dry beds of torrents, overgrown with such plants as *salicornia*, *acacia*, and *calotropis*; and there are also patches of coarse grass. On a few mounds were found broken pieces of fluted columns, capitals, and fragments of a very dark-coloured volcanic stone. A slight excavation revealed the bronze balance and chain of a pair of scales—an appropriate first discovery in the ruins of a great commercial city which existed when the Greeks, in the days of the Ptolemies, carried on a thriving trade with Annesley Bay.

The modern village of Zoulla is at a little distance from the mounds on the right bank of the Hadas, one of

the streams which crosses the plain. The Shohoes inhabiting it are a black race, with rather woolly hair, and small-boned, but with regular and, in some instances, even handsome features. They wear cotton cloth round the middle, and a cloak of the same material. Their head and feet are bare, and they are armed with a curved sword, worn on the right side, a spear, a club, and a leather shield. They cultivate a little jowaree, and have cattle of a very diminutive breed, asses, horses, and sheep. Their huts are scattered over the plain. Their burial-places are extensive, and appear to be used by the people for a considerable distance around them, there being only two between the coast and the entrance to the Senafé Pass. The mode of sepulture is peculiar. The graves are marked by oblong heaps of stone, with upright slabs at each end. A hole is dug about six feet in depth, and at the bottom a small cave is excavated for the reception of the body. The tomb is closed with stones, and the hole leading to it is filled up. The plain around Zoulla abounds in game—antelopes, gazelles, hares, bustards, and spur-fowl. During rains the game is said to be still more plentiful. The coast rains usually commence in December, but there is no great fall; and, beyond a drizzling morning on the 15th of last December, there was no rain up to the end of the month.

At Lower Ragolay a great salt plain extended to the south as far as the eye could reach. The ground was white with incrustations of salt. The whole region had been under volcanic action. Evidences of it were observed at every turn. The most valuable discovery made was the nature of the Ragolay River system. It was ascertained that the eastern drainage of the whole Abyssinian watershed from Senafé to Atebi consisted of tributaries of the Ragolay River; and these two places are about seventy geographical miles from each other. Where the party touched the river it was a perennial stream. In flowing towards the sea, it descends into a depression 193 feet below the sea level, probably caused by some violent volcanic action, and its waters are finally dissipated by evaporation under the intense heat of a scorching sun, and by absorption in the sand. The great salt plain may be looked upon as occupying the place of a vast lake outlet. Under similar circumstances such a lake would exist in a less burning climate; but here the heat of the sun gives rise to such rapid evaporation that no moisture remains except a swamp here and there, and the ground is left with an incrustation of salt.

The Senafé Pass was first examined early in November, and the advanced brigade were led up it between the 1st and 6th December. Koomayloo, the entrance, ten miles west from the camp at Mulkutto, is 433 feet above the level of the sea. The road winds up the dry bed of the Nebhaguddy to Lower Sooroo, a distance of eight miles. In places the alluvial deposit brought down by the torrent was from ten to twenty feet thick. The pass winds very much, and is narrow, whilst the gneiss mountains rise up perpendicularly on either side. In this part the vegetation is like that of the coast plain. At Lower Sooroo the rain-water which flows from Upper Sooroo, four miles off, is lost. Volcanic action is here distinctly visible. The gneiss cliffs are perpendicular on the west side, and in one place a vertical crack, some five feet in width, is filled in with a black volcanic rock. The eye is caught by it at once; it looks like a broad black mark painted on the face of the cliff from the summit of the pass. The road turns sharp to the right, and enters a very narrow pass at Middle Sooroo. It is not more than from 50 feet to 100 feet across, with cliffs on either side, rising to a

height of 1,000 feet, while the pass is (or was) blocked up with gigantic boulders of gneiss heaped together in wild confusion for a distance of 250 yards. The scenery here is magnificent.

AN ABYSSINIAN SOLDIER.

At Upper Sooroo, twelve miles from Koomayloo, the pass opens again. The water is excellent and plentiful. Upper Sooroo is 2,520 feet above the level of the sea. Further on, near Sowakte, the gneiss ceases, and dark schistose metamorphic rock takes its place, apparently overlying it, with strata thrown up at angles of upwards of 70 degrees. It was observable that where there was running water the strata were nearly horizontal, and but slightly tilted, while the waterless tracts were met with where the strata were tilted at great angles. A plain was passed where there were guinea-fowl, candelabra-trees, and aloes, and the scenery in the pass became fine. The cliffs became higher, with peaked mountains towering up behind them, and the vegetation became richer and more varied. The strata of the schistose rocks are not only tilted at great angles, but crumpled into irregular waves, and where there are veins of quartz, the two kinds of rocks are torn away, leaving gaping cracks and fissures. Here there grew figs, peepul, banyan, sycamore, tamarind, jubub, and solanum trees and plants. The pass winds in and out among the mountains. At several spots the cliffs approach within forty feet, while the foliage of four or five venerable banyan trees overshadow the road. In some places there was

a perfect plague of locusts, which rose from the ground in myriads as the party approached, their innumerable wings making a loud crackling noise. Monkeys were numerous in places, and the carcasses of mules had attracted hosts of Abyssinian vultures.

From Upper Sooroo to Rara Guddy the flora becomes alpine. There is turf by the roadside, and there are tall, handsome juniper pines, mimosa, peepul, banyan, sycamore, fig, kolquall, and jubub trees, an evergreen bush with sweetly-scented flowers (*Myrsine Africana*), lobelia, solanum, and wild thyme, while the graceful clematis climbs over the trees. Senafé is on the tableland, eight miles from Rara Guddy; it is five miles to the foot of the ascent, one mile and a half up the ascent, and one mile and a half across the plateau. The length of the gorge from Komayli to the foot of the ascent to Senafé is thus forty-six miles. The ascent of the sloping rocky side of the hill is by no means difficult, and the plateau of Abyssinia is thus reached.

The British camp at Senafé is on a plain, surrounded on every side but the south-west by an amphitheatre of sandstone hills and rocks. This sandstone seems to overlie the metamorphic rocks in the pass. All the table hills towards the south and west are said to be of the same formation. Senafé is 7,464 feet above the level of the sea. The plain is covered with grass or stubble, barley fields dotted with juniper pine, wild thyme, and other bushes. Northward is a scarphill 8,561 feet high. A north-west view over the Hamas valley shows flat-topped mountains rising one above the other into the far distance. Within half a mile of the camp are four remarkable masses of sandstone, each of which rises out of the plain in a confused mass of peaks and precipices. South-west there is a slight rise to a rocky ridge, where the land slopes gently down into an extensive plain, bounded by mountains. South-east, a wild gorge leads to the Ragolay river, down which the drainage of the Senafé plain flows, after furnishing abundant supplies of excellent water. The village of Senafé is at the foot of a grand mass of sandstone rock. It consists of about a dozen houses built of rough stones and mud, with flat roofs, branches being placed in rows across beams and covered with mud. Broken jars plastered into the roof serve as chimneys. The outer door is very roughly formed with wooden posts and lintel, and leads into a large outer hall. This serves as a stable for cattle and goats. A mud platform along one side is the sleeping-place for servants and guests. Doors lead from this into two much smaller chambers occupied by the family. The population of Senafé is about 240, all Mohammedans, an upright people, with good features, very black complexions, and woolly hair done in plaits. The women are filthily dirty, and wear leather petticoat and mantle and necklaces of beads. The dress of the men differs from that of the Shohoes in their having cotton drawers. Senafé is the last Mohammedan village; all beyond in the village of Shamazana are Christians.

One remarkable feature of the region is the number of plateaux, whose summits form a straight level, terminating in scarped sandstone cliffs with underlying schist rocks, the plateaux being diversified with flat-topped peaks and separated by deep ravines and wide valleys.

In the valleys the edges of schistose rock crop up in every direction, with veins of white quartz, the stones and pebbles of which cover the shallow soil of disintegrated rock. Here and there rocks rise and form isolated conical hills, upon which the villages are built. Wherever the hills rise above a certain height they are capped with

sandstone. This sandstone deposit has been washed away in the valleys until the underlying schist is exposed. The schist is first met with in the Senafé pass at an

quented by flocks of geese and ducks, kullum (a kind of heron), ibis, and curlew. Slopes around the village are ploughed, and yield crops of barley, and the low lands

ANKOBA, CAPITAL OF SHOA.

elevation of 3,000 feet; it is overlaid by sandstone at a height of 7,000 feet, so that the perpendicular depth of

afford pasture for cattle and sheep.

The population of sixteen villages in the valley, including

INTERIOR OF ABYSSINIAN HOUSE.

this formation must be 4,000 feet. Eastward, low parts of the valley are covered with excellent pasture, fre-

Senafé, is about 5,000 souls. From the 1st of January to the 15th they furnished 60,000lb. of barley, and

200,000lb. of grass. Some of this comes from the neighbouring valley of Mai Mena. Westward there are long, deep, and very picturesque gorges, with perennial streams of delicious water forming deep pools among the giant boulders of sandstone. This difference may have been caused by increasing rainfall as the party advanced westward. One feature of the ravines is the river beds, which carry off the drainage. The deepest and grandest gorge is that of the Hamas, to the west of Senafé. Sandstone cliffs overlie the schistose rock, which is cut up by deep watercourses filled with gigantic masses of sandstone hurled from the cliffs above. These boulders form deep caves, the lurking places of panthers and hyenas.

A most interesting point of observation in this Alpine region is the character of the vegetation with reference to the zones of elevation. On the summit and slopes of Sowayra (9,100ft.) the flora is of a thoroughly temperate and even English character. The only tree is the juniper, while the most common plants are lavender, wild thyme, dog roses, clematis, violets, and cowslips.

The sandstone plateaux have the same flora; but the highland slopes of the hills bounding the valleys are enriched by many trees and shrubs of a warmer climate. In the lovely gorge of Baraka, rendered sacred by the shrine and church of the Abyssinian saint, Romanos, and his fellow martyrs, masses of maidenhair fern droop over the clear pools of water, and the undergrowth consists of a myrsine, a large lobelia, and solanum. At this elevation vegetation akin to that of the Bombay ghauts commences. Huge and venerable dahio trees (the representatives of the Indian banyan) grow near the villages and afford shelter for flocks of pigeons. Tamarinds, mimosæ, jubul, and oleander trees appear in the ravines. But the English types around Mount Sowayra do not descend lower than Rara Guddy, 6,000 feet above the sea, and they disappear altogether in the Hamas gorge, where there is nothing but acacias and mimosæ. Thus the temperate flora may be said to extend over a zone from 9,000 to 6,000 feet above the sea; the subtropical from 6,000 to 3,000 feet; and the dry tropical coast vegetation from 3,000 feet above the sea. The open elevated valleys are, as a rule, bare of trees. The dahios and acacias only occur in sheltered places near the villages, although the loftier plateaux are pretty thickly covered with low juniper trees, overgrown with clematis.

CURIOSITIES OF LAMBETH.

II.

LAMBETH has for two centuries been noted for its places of public amusement. Vauxhall, the early "Spring Garden," was named, from its site in the manor of "La Sale Fawkes," Fawkeshall, from its possessor, an obscure Norman adventurer in the reign of King John. The estate was laid out as a garden about 1661, in squares, "enclosed with hedges of gooseberries, within which were roses, beans, and asparagus." Sir Samuel Morland took a lease of the place in 1665, and added fountains and a sumptuously furnished room for the reception of Charles II and his court; and a plan, dated 1681, shows the gardens planted with trees, and laid out in walks, and a circle of trees or shrubs. They were frequented by Evelyn and Pepys; and Addison, in the "Spectator," 1712, takes Sir Roger de Coverley there. In 1728, the gardens were leased to Jonathan Tyers, who converted the house into a tavern, decorated the grounds with paintings, erected an orchestra and alcoves, and set up an organ. Hogarth and Hayman

painted the pavilions and supper-boxes, and vocal and instrumental music were added. Horace Walpole and Fielding visited the gardens, which were then illuminated with 1,000 lamps; and Oliver Goldsmith and Miss Burney describe the Vauxhall of their time. The gardens were open from 1732 to 1840; they were reopened in 1841, and finally closed in 1859, when the theatre, orchestra, firework gallery, fountains, statues, etc., were sold; with a few mechanical models, such as Sir Samuel Morland, "Master of Mechanics to Charles II," had set up here nearly two centuries previously. The site was then cleared, and a church, vaulted throughout, was built upon a portion of the ground, besides a School of Arts, etc. Westward of Vauxhall were the Cumberland Tea Gardens, named after the great Duke; the site is now crossed by Vauxhall Bridge Road. An earlier garden was the Dog and Duck, dated from 1617, the year upon the sign-stone preserved in the garden-wall of Bethlehem Hospital, built upon the site. At the Dog and Duck, Mrs. Hannah More lays a scene in her excellent tract, "The Cheapside Apprentice." At Lambeth, also, were the Hercules Inn and Gardens, the Apollo Gardens, the Temple of Flora, etc. A century earlier, here were Lambeth Wells, the mineral water of which was sold at a penny a quart. About 1750, a musical society was held here, and lectures were given by Erasmus King, who had been coachman to Dr. Desaguliers, the first that introduced the reading of lectures to the public on natural and experimental philosophy: he several times read before George II and royal family.

It will be sufficient to name Astley's Amphitheatre, burnt in 1794, 1803, and 1841; near the site of the first theatre, the ground landlord had a preserve or breed of pheasants. The Surrey Theatre, in St. George's Fields, has been twice burnt. The Victoria Theatre was founded in 1817, with the stone materials of the old Savoy Palace, Strand, then being cleared away.

Some public institutions in Lambeth are entitled to special mention. Here was the Asylum for Female Orphans, established chiefly through Sir John Fielding, the police magistrate, whose portrait Hogarth painted; the premises have been rebuilt at Beddington. Next is the Magdalen Hospital, which dates from 1758, patronised by Queen Charlotte fifty-six years, and by Queen Victoria since 1841. Bethlehem Hospital was rebuilt here in 1814, when the old hospital in Moorfields was taken down; adjoining is the House of Occupation, built upon the demolition of Bridewell Hospital. Hard by is the School for the Indigent Blind, originally established in the Dog and Duck premises, but rebuilt in the Tudor style in 1834.

A street in Lambeth was the scene of a strange event in our criminal history. In Oakley Street, at a low tavern, in November, 1802, Colonel Despard, with thirty-two other persons, were apprehended on a charge of high treason; and Despard and seven associates being tried by special commission, and found guilty, were executed on the top of Horsemonger Lane gaol.

Lambeth was long noted as the abode of astrologers. In the house of the Tradescants, in South Lambeth Road, lived Elias Ashmole, who won Aubrey over to astrology. Simon Forman's burial is entered in the Lambeth parish register; he died on the day he had prognosticated. Captain Bubb, contemporary with Forman, dwelt in Lambeth Marsh, and "resolved horary questions astrologically," a ladder which raised him to the pillory. In Calcut Alley lived Francis Moore, astrologer, physician, and schoolmaster, who concocted "Moore's Almanack." Next to Tradescant's House, "The Ark," lived the learned

Dr. Ducarel, one of the earliest Fellows of the Society of Antiquaries. Tradescant's garden was well stored with rare and curious plants, collected in his travels. He was "King's Gardener" to Charles I, and, with his son, assembled at Lambeth the rarities which became the nucleus of the Ashmolean Museum, now in the University Museum of Oxford.

At Narrow Wall, one of the embankments across the swampy fields, flourished for nearly fifty years Coade's manufactory of burnt artificial stone (a revival of *terra cotta*), invented by the elder Bacon, the sculptor, and first established by Mrs. Coade, from Lyme Regis. Of this material is the bas-relief at Greenwich Hospital, of the death of Nelson, designed by West. The Vauxhall Pottery, established two centuries since, by two Dutchmen, for the manufacture of Delft ware, is, probably, the origin of all our existing potteries; two other potteries at Lambeth were commenced in 1730 and 1741; the potters procure the clay from Devon and Dorset, and the ground flint from Staffordshire. Salt-glazed stone ware is made in Lambeth, of the yearly value of £100,000, of which more than half is paid for labour. In chemical works here, are combined the crushing of bones and the grinding of mustard, with the manufacture of soap and colours, and bone brushes; and stearine, glue, hartshorn, and phosphate of lime, are obtained by steam-power from the refuse of slaughtered cattle. The London Gas Company's Works at Vauxhall are stated to be the most powerful and complete in the world: their mains pass across Vauxhall Bridge to western London, and by Westminster and Waterloo Bridges, to Hampstead and Highgate, seven miles distant, where they supply gas with the same precision and abundance as at Vauxhall. Hawes's Soap and Candle Works, at the Old Royal Barge House, have existed for more than a century. Above Vauxhall Bridge are Price's Works, established 1842: here candles are made from cocoa-nut oil brought from the company's plantations in Ceylon, and palm-oil from the coast of Africa, landed from barges at the wharf at Vauxhall. The oil being converted, by chemical processes, into stearine, is freed from oleic acid by enormous pressure; is liquefied by steam, and then conveyed into the moulding machinery, by which 800 miles of wicks are continually being converted into candles. The buildings are of corrugated iron, and the furnaces consume their own smoke. Shot is made in the lofty towers immediately above and below Waterloo Bridge. The quadrangular tower is 150 feet high; in the upper storey the alloy of arsenic and lead is melted by a furnace, and is then ladled into a kind of cullender, through the holes of which it falls *like rain*, for about 130 feet, into water in the lower floor of the building. The circular shot tower, 100 feet high, is strikingly beautiful, rivalling Wren's London Monument. Plate-glass, for mirrors and coach-windows, was first made at Vauxhall by Venetian artists, under the patronage of the second Duke of Buckingham, in 1670. The establishment, which stood on the site of Vauxhall Square, was broken up in 1780. The finest Vauxhall plates we remember are those in the Speaker's State Coach. The Falcon Glasshouse, which has existed a century, in Holland Street (the site of Holland's Leaguer, the old moated Manor House of Paris Garden) occupies the site of the tide-mill, and is named from the Bankside Tavern, which is said to have been frequented by Shakespeare. The late proprietor of the Falcon Glass-works, Mr. Apsley Pellatt, wrote a small quarto, entitled "Curiosities of Glassmaking," published in 1848, now scarce.

In Stamford Street, Blackfriars Road, are Clowes's Printing Works and Foundry, stated to be the largest

in the world: they were commenced by Augustus Applegath, the eminent engineer, and a great improver of steam-printing machinery. The works of Maudsley and Field, in the Westminster Road, commenced in 1810, employ from 1300 to 1400 workmen, besides steam-power. Here are fashioned immense metal screws, like the double tail of a whale; parts of engines several tons weight are lifted by cranes to be adjusted and joined together; cylinders are bored of such diameter that a man might almost walk upright through them; engines cut and shave hard iron as if it were soft wax; cutting instruments have a force of thirty tons; and steam hammers are of thirty cwt.

The district which we have here traversed with our mind's eye, and traced from a swampy suburb to a vast hive of industry, has a strange history. Its population has increased from 27,985, in 1801, to 139,240, in 1851; and 162,008, in 1861. Nearly to the present century, St. George's Fields lay waste, and were the scene of brutalising sports, political meetings, and low places of entertainment. In their water-ditches Gerard found water-violets; William Curtis, the celebrated botanist, in Lambeth Marsh assembled the finest and most complete arrangement of British plants ever before collected; and scores of gardens existed here to our times. But the life of the place was wasteful and recreant, to which the King's Bench Prison contributed. Here a riot was raised by the mobs, who went to visit Wilkes, one of the earliest inmates of the prison; here Lord George Gordon's Rioters met, June 2nd 1780; and on the 7th the 700 prisoners in the King's Bench were liberated, and the building set on fire by the mob. Lambeth, a few years since a feverish marsh, has been greatly improved by drainage. Maudsley's Foundry was raised on pillars from the swamp, where at times a boat might have floated; it is now, by drainage, firm and dry at all seasons. Lett's timber-wharf, from the time of Queen Elizabeth until the beginning of this century, amidst pools and marsh-streams, is now dry and healthy. The building of Waterloo Bridge, and the raised roadway above the Marsh and the Acre, was the first great improvement in the surface of the district, which still is low in the scale of mortality. Next was the extension of the South-Western Railway—from Nine Elms to Waterloo Road, two miles fifty yards—at a cost of £800,000, though it crosses the most grimy portion of Lambeth. Along the river bank, anaconda-like, upon arches, trends another railway extension from London Bridge, across the Thames, below the new bridge at Blackfriars.

Kennington, a manor of Lambeth, named from Saxon words, signifying the place or town of the King, had its royal palace eight centuries since. Here, in 1231, King Henry III held his court, and passed a solemn and stately Christmas; hither came a deputation of the chiefest citizens to Richard II, June 21st, 1377, "before the old King was departed." Here resided Henry IV and VI, and Henry VII shortly before his coronation; Katherine of Arragon was here for a few days; Edward III was here in 1379, from a document tested by the Black Prince, then only ten years of age. James I settled the manor, with other estates, on his eldest son, Henry, Prince of Wales; after his decease, on Prince Charles, afterwards Charles I, and they have ever since been held as part of the estate of the Prince of Wales, as Duke of Cornwall. Charles was the last tenant of the palace, which was then taken down, and there was erected on the site a manor house, described in 1656, as an old, low, timber building. The palace stood within the triangular plot of ground near Ken-

nington Cross. Kennington Common (about twenty acres), was the place of execution for Surrey until the erection of the county gaol, Horsemonger Lane. On Kennington Common, in 1745, was hanged, with other rebels, "Jemmy Dawson," the hero of Shenstone's touching ballad, and of another ditty, set to music by Dr. Arne, and sung about the streets. On the common preached, as we learn from his Diary, George Whitfield, to audiences of ten, twenty, and thirty thousand persons. The evening before he embarked for America, he preached here to 20,000 persons, on St. Paul's parting speech to the elders of Ephesus; the people were exceedingly affected; many tears were shed at parting, and Whitfield could scarce get to the coach for the people thronging him to take him by the hand and give him a parting blessing. In 1852, the common, with the site of the Pound, was granted by Act of Parliament, on behalf of the Prince of Wales, as part of the Duchy of Cornwall estate, to be enclosed and laid out as "pleasure grounds for the recreation of the public; but if it cease to be so maintained, it shall revert to the duchy." This has been done, and at the main entrance have been reconstructed the model lodging-houses, originally erected at the expense of Prince Albert the Good, for the great Exhibition of 1851; the walls are built with hollow and glazed bricks, and the floors are brick and stucco, the whole being fire-proof.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDE.

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."

COWPER.

IV.—MARKS AND CROSSES.

THE other day, while taking some of my loophole-peeps, as I strolled through our little village of Minima Parva I had stopped at a thatched cottage to speak with Mrs. Giles, whose husband was a drainer. Her daughter Martha stood by; and, as this young woman was being "asked out in church"—as we, in the vernacular of Minima Parva, term the publication of banns of marriage—I took the liberty to say that I hoped, when her wedding day came, that even if John Jinks (the expectant bridegroom) did not write his name in the marriage-register, yet that she at least would do so. Martha blushed and simpered, and murmured something about not being much of a scholar, but could not deny that she had not forgotten her excellent copy-book performances at the village school, or that she was the scribe to half the people in the parish whenever the tremendous event of getting a letter written had to be performed. But my wish was futile, for, as I afterwards discovered, Martha Giles made "her mark" in the marriage-register, and thus, she and her husband, John Jinks, began their wedded life with "crosses." *Absit omen!*

This is a matter worth noting, because "the mark of Martha Giles" would be considered (and naturally so) a sufficient proof that the said Martha was so deficient in education as to be unable to pen her name. And yet this conclusion, although perfectly natural, would be utterly erroneous. It is said that statistics may be made to prove anything, when dexterously manipulated. But the statistics of marriage "marks and crosses," although involving a considerable amount of truth, certainly go beyond and outside of the real facts. National education is defective enough; but in this particular it is not quite

so black as it is painted. Yet it was upon the carefully-prepared statistics of marriage marks and crosses that Earl Russell, following many precedents, based a portion of the argument contained in his important speech on Education, made in the House of Lords, December 1st, 1867. "I may state," he said, "that there are in existence statistics showing the number of persons who could not write their names when they are married." These were unevenly distributed; but "the proportion generally, over England and Wales, may be taken at about 30 per cent.;" and this state of things, he thought, "justifies some proceedings of a very wide and comprehensive nature, to carry the blessings of education still further" than they have yet been carried. As to the main point, the desirableness of extending education so as to make those write who never wrote before, we are all agreed; but I certainly cannot place implicit reliance on the perfect accuracy of the statistics relating to marriage marks and crosses, as I know, from repeated evidence, that their appearance in the register-book is not to be accepted as an infallible sign that the persons who made them were unable to write their names. Quite the contrary. There are many Martha Giles in the world who possess scriptorial powers, which, for various reasons, they do not care to display

A MAN OF MARK.

on particular occasions. There is what the Irishman calls the sheepishness of the bovine race, the rustic bashfulness of our indigenous Arcadians, at writing before witnesses, especially in a church and in the presence of a parson. There are the hot hands, and the inability to draw from them the unaccustomed Berlin gloves, and there is the very pardonable agitation of the bride and bridegroom, which is sympathetically shared by the bridesmaid and best-man. These, and other causes, influence the contribution of marks and crosses to the marriage-register. There is sure to be a trembling of the hand, even though that trembling is merely the result of nervousness, and not caused by the vicious plan of "keeping spirits up by pouring spirits down," which, as the clergymen of seaport-

towns can testify, is often adopted by "Jack" and his friends, when they haste to the wedding. And when, from any cause, the hand-trembling exists, and is attended by no very great dexterity in penmanship, then it very probably happens that two or three, if not all four, who have to "witness" the wedding, prefer that the parson should do the writing, and that their own performance should be limited to making a cross for "their mark." Afterwards comes the inevitable statistician, who duly records that these people were so ignorant as to be unable to write; whereas they were not ignorant, but nervous, idle, thoughtless, and, worse still, untruthful. It is not long since that there was a wedding in a country church, the bridegroom being a very clever mechanic, who had charge of a steam-engine, and was in the receipt of high wages. But, although a skilled workman, he was altogether deficient in the art of writing, and he transacted his business affairs through the difficult medium of chalked hieroglyphics. To the surprise of the officiating clergyman (a stranger), this respectable, well-dressed man, on the pen being handed to him, declared his inability to write, and accordingly placed "his mark" in the book. His pretty young bride did the same. Some months after this, the clergyman had an opportunity to ask her if she had not received a more than ordinarily good education for a cottager's daughter, from having been at an excellent school in that neighbourhood. Yes, she had. "And of course you can write?"

"Oh, yes! I keep my husband's accounts and make out all the bills."

"Then why did you not write your name in the marriage-register?"

With a bright smile and an honest flush, she at once replied—

"Would I shame my husband on his wedding-day?" Here was true womanly delicacy, and the very essence of romance; but, to tell such persons that they have done wrong, and that they have told a falsehood in a most solemn place and on a very solemn occasion, would probably have no more weighty effect upon them than to tell them that they had been wilfully assisting in the preparation of erroneous statistics on marriage marks and crosses.

The parson-poet Crabbe writes thus on this subject:—

"Behold these marks uncouth! how strange that men
Who guide the plough should fail to guide the pen. * * *
Our peasants, strong and sturdy in the field,
Cannot these arms of idle students wield;
Like them, in feudal day, their valiant lords
Resign'd the pen and grasp'd their conqu'ring swords;
They, to robed clerks and poor dependent men,
Left the light duties of the peaceful pen;
Nor to their ladies wrote, but sought to prove,
By deeds of death, their hearts were fill'd with love."

These lines are from the poem of "The Parish Register."

The most singular marks that are found in parish-registers are those made by churchwardens, in the days spoken of in Crabbe's lines, when those parochial dignitaries could not pen their names, and the parson was frequently the one scribe of the parish. And those days are not so many centuries distant; for parish-registers did not exist before the year 1530, when they were first established by Cromwell, Lord Essex. At certain intervals the records in these registers were examined by the parson and his churchwardens, and a note to that effect was placed upon the parchment page, together with the names of the three examiners. Then, the obstacle of the churchwarden's ignorance of writing had to be surmounted by "their marks" being affixed to their names, as written by the parson, (*i.e.*, the *per-*

sona or person who has charge of the parish.) And each churchwarden invented for his signature or mark a certain hieroglyphic, which he continued to use on all similar occasions, and for which, as it were, he took out a patent which must not be infringed. I have even seen these churchwarden-marks branded on the oaken timbers of a church, which had been repaired or newly-roofed during their term of office. Their marks, however, were of a highly elaborate and complicated character, and very different from those marriage-marks of which I have been speaking, which are made by two strokes of the pen in the form of a cross, and are intended to represent the sacred symbol of salvation, as though they who made the marks pledged their solemn oath to the truth of the document they were called upon to attest.

The consideration of such marks and crosses may carry our thoughts to other cross-like marks, which are brought into prominence on a certain day in the year—which day usually falls in the month of April, and in the present year is on April 10th. Of course I refer to the cross buns of Good Friday. Speaking of buns, I recollect a conversation that I had, not with Mrs. Giles, but with her husband, the drainer. He was telling me how he and others had found, while draining, a stone coffin and various other things, which Giles called "pots, and pans, and sich like rubbidge," but which were, in fact, choice specimens of Samian ware and Romano-British pottery.

"And then," said Giles, after speaking of the discovery of heaps of oyster-shells, the remnants of the feasts of Roman epicures, "and then we fund a sight o' buns."

"Buns!" I cried, "how curious! What kind of buns?"

"They was Christian buns," replied Giles, with solemnity.

"Christian buns!" I echoed. "This is more curious still." Could they have been cross-marked buns? and, if so, what an interesting subject it would make for a paper to be read at the next meeting of the local Archaeological Society, at the neighbouring town of Maxima Parva, "On the Antiquity of Cross-buns, with Roman specimens obtained from ancient *tumuli*." But this day-dream was dispelled by Giles saying—

"Christian buns, you understand, sir. Skulls, arm-buns, thigh-buns, and sich like."

Upon which I was aware that Giles's provincial pronunciation of the word "bones" had somewhat led me astray. Yet this subject of the cross-bun is one that neither lacks its antiquarian nor archaeological interest; and, since it falls in with our present theme of marks and crosses, and can more appropriately be considered in the month of April than in any other month, let me ask the reader to bestow for a few moments a loophole-peep at what I may term the lore of the Lenten cake.

Of the old cries of London, familiarised to us by the spirited etchings of Marcellus Lauron, such as the New-River water, the writing-ink, the Holland socks, the mutton-pies, and the piping-hot fritters, the greater part have passed away; and of the few survivors which seem to connect us, if not exactly with "the tender grace of a day that is dead," yet, at least, with the pleasanter memories of a bygone time, there is one cry that still lovingly lingers among us, although it is heard but on one day in each year; and that is the Good Friday cry of "One a penny, two a penny, hot cross-buns!" The restriction of the bun to the particular day, its circular form—for an oval cross-bun would be deemed by purists in pastry to be as great a solecism as a round mince-pie that did not, therefore,

represent the true lengthened oval form of the sacred crotch or manger-cradle—and the emblematic cross marked within that circular form, these three points, of themselves, denote the Lenten Cake to be a species of consecrated bread. And this is no mere fancy or metaphor; for, formerly, such buns, or *eulogiæ*, were made from the dough of the mass-bread, in order that the priest might distribute them to such as were otherwise unable to partake in the sacramental celebration. These eucharistic wafers or sacred cakes were thus issued from consecrated buildings, to be eaten in private houses; and so, after the Reformation, it easily came to pass that Protestants retained the custom, so far as to eat in their houses an emblematic cake. Nor was it surprising that they should restrict its use to the most solemn fast-day of the year, because the cross that was marked upon the cake so especially reminded them of the great event commemorated on that day—"Holy Friday," as it was generally called; "Long Friday," as the Saxons termed it, perhaps with reference to the lengthened fastings and offices of the day—but a day to which the English Church alone throughout all Christendom has prefixed the emphatic appellation "Good," in remembrance of the unspeakably good things secured to mankind on that day. And so the cross-bun, the Lenten Cake, sweetened and flavoured with allspice, in token of the spices "prepared" by the pious Galilean women, was eaten at breakfast by devout Protestants on Good Friday morning, not without a certain reverent solemnity in keeping with the day.

So popular did these cakes become, that, in the earliest years of the present century, Chelsea alone supplied many thousand hot-cross buns to eager purchasers, who, from six in the morning to six in the evening of Good Friday, thronged the pavement beneath the wooden porticoes of the two royal bun-houses. For there were two houses, both claiming not only to be "the royal," but also "the original," until the sign of the one attained its grand climacteric by proclaiming itself to be "The real, old original Royal Bun-house;" after which, the force of titles could no further go. It was, however, by no means a subject for national sorrow when those two royal bun-houses fell into decadence; and it is to be hoped that their old customers learned to observe the day in a better manner than by flocking to the Chelsea piazzas to buy buns and interchange gossip and scandal. It was evident that although Christmas Day and Good Friday are the only two "close" holidays observed in England, when shops are shut and public offices are closed, yet that the Chelsea confectioners and other pastry-cooks of George III's day, could not make much of a holiday on Good Friday, so long as hot cross buns were in full demand. At the present time, they are made on the previous day, Maundy Thursday, so called because it was the *dies mandati*—"That thou doest, do quickly;"* and they are distributed on the evening of that day, or betimes on the Good Friday morning; so that both the makers and purchasers of cross-buns are enabled to pass the remainder of the day in a more befitting and profitable manner, than by crowding and chattering under the portico of a bun-house.

But these round cross-marked Lenten cakes were not always Christian buns, as my friend Giles would have said; rather are they christianised buns, for they have come down to us both from Jews and heathens.

With the former they were the passover cakes, and were also eaten in memory of the manna. For this they were flavoured with coriander seed, which was similar to that "small, round thing" whose taste was "like wafers with honey," which served the children of Israel for bread in the wilderness. The Jewish women of Pathros, in Egypt, are described in the Bible as offering "cakes to the queen of heaven," who, doubtless, was Astarte; and these *liba* being in blasphemous imitation of the shewbread, the prophet rebuked them for abandoning themselves to the heathen custom. It did not, therefore, originate with the Jews; and we must go back a step or two farther in the world's history in quest of the origin of buns.

Without wandering so far afield as patriarchal and antediluvian times, and endeavouring to identify the bun with the consecrated bread of the patriarch, or with a portion of Cain's sacrifice, we may stop short at the founder of twelve-villaged Athens, the enlightened Egyptian Cecrops; and we may rest content with the antiquity of 2,400 years that is thus credited to the bun. Cecrops' buns were sweet cakes made of flour and honey, and, no doubt, were the cakes just referred to, that were offered by the Jewish women "to the queen of heaven."

"Ashtoreth, whom the Phenicians called
Astarte, Queen of Heaven, with crescent horns."

It was, most probably, those lunar crescent horns whose form was stamped upon the cakes; and not only has Cecrops' cake, with its sacred symbol, been accepted as the original of our Good Friday cross-bun, but some philologists have even detected a connection and verbal resemblance between Astarte and Easter. And this brings us to the etymology of our word "bun." The horns marked upon the cake required but little alteration to change them from the horns of Astarte to those of the sacred ox, *bous* (oblique *boun*) which was not only a Greek, but also a more ancient Tartar word; and the consecrated cake, marked with the horns of the sacred ox, was thence called the *boun*,* from which we derive our "bun."

In process of time, the Greeks came to mark the round buns with the form of the cross, so that, by its means, the cake might be the more readily broken into four equal parts; and two such cross-marked cakes were found in the ruins of Herculaneum. The cross-mark now became general, and was adopted by Christians in the spirit symbolism. The eucharistic bread of the Greek church was thus stamped; and in St. Chrysostom's Liturgy the priest is described as "attentively and reverently" dividing the consecrated cross-marked wafer "into four pieces." And so we trace on, from Cecrops to

* At the very opening of the "Agamemnon" of Æschylus, we find ourselves in front of a formidable *boun*, over which scholiasts and commentators have fought and differed. The watchman is there made to say, that a great *bous* has come (or set foot) upon his tongue. Now, was this *bous* an ox or a bun? it might mean either; for the expression is evidently some proverbial or idiomatic saying. While it might only mean that something as weighty as the tread of an ox held down his tongue in silence, it might mean that he had been initiated into certain secrets through the medium of the sacred horn-marked cake; and, on the other hand, as certain Greek and Roman coins were stamped with the figure of an ox, it might mean that he had been bribed to keep silence, by the gift of an ox-marked piece of money. Curiously, at this very day, a crown piece is called, in thieves' argot, "a bull;" which bit of slang, like "togger," from *toga*, is not altogether unclassical, if we allow that *pecunia* (money) is derived from *pecus* (cattle or oxen); to say nothing of our "bull," from *bous*, and "cow" from the same word, through the Sanscrit *gau*, the *h*, as is often the case in cognate languages, being turned into *g*. Thus, the *boun*, or bun, came to be symbolical of the animal; and it was certainly much cheaper and easier to offer a hundred such buns than the hecatomb of genuine oxen. Horn-marked buns, such as these, are mentioned by Julius Pollux and Diogenes Laertius.

* Or, the command was that to the Apostles, "do this," etc., relative to the institution of the Lord's Supper. Or, as others think, the command for humility—relative to the washing of feet; or, the command to love one another.

Chrysostom, through *boun*, *libum*, and *eulogia*, until we come to our modern orthodox and Protestant cross-bun. Here, then, is a sequence of centuries for "marks and crosses."

Another loophole peep at the subject, and I have done with it. As might be expected, the sweet-spiced Lenten cake is not without its flavour of folk-lore—a flavour for which many of us have a toothsome weakness. Some people, instead of eating their cross-bun, carefully preserve it until the next Good Friday; and, in the twelve-month's interim, if the need should arise, they will find the bun, when grated and eaten, an infallible remedy against disease, no matter what that disease may be. As a specific, therefore, a mouldy cross-bun must be equally as valuable as Quackaway's pills. Did I say "mouldy?" I was wrong. Such buns never grow mouldy, as ordinary buns would do. Even poor Robin bore testimony to this, in his *Almanac* for 1753, where, speaking of the cross-buns, he says—

"Whose virtue is, if you'll believe what's said,
They'll not grow mouldy like the common bread."

Of course they will not; or, if they did, it would only show that they had not been rightly made. But, not only will a cross-bun kept in the house from one Good Friday to the next, preserve its possessors from sickness, it will also save them from the expense of insuring their property from fire; for it is a canon of faith with believers in folk-lore, that "the devouring element" can never consume that house in which is preserved the charmed cross-marked Lenten cake that was once a Good Friday hot cross-bun.

ROMANCE OF HERALDRY.

BY THE EDITOR OF "DEBRET'S HOUSE OF COMMONS."

III.

LADIES bear their arms upon a lozenge or diamond-shaped figure. The only existing exception is that of her Majesty the Queen, who bears her armorial insignia upon a complete shield. And the reason for this anomaly is explained in the following apposite rhyme:—

"Our sagest men of lore define
The kingly state as masculine,
Puissant, martial, bold, and strong;
The stay of right, the scourge of wrong;
Hence those that England's sceptre wield
Must buckle on broadsword and shield,
And o'er the land and o'er the sea
Maintain her sway triumphantly."

The origin of the lozenge is uncertain, and numerous and curious hypotheses have been suggested. Menestrier, in his "*Pratique des Armoires*," considers it to have had its rise in an ancient Hollandaise custom. He says—"In Holland the custom prevails every year, in May, to affix verses and *lofzangen* (songs of praise), in lozenge-formed tablets, on the doors of newly-made magistrates. Young men hung such tablets on the doors of their sweethearts, or on those of newly-married persons. Also, on the death of distinguished persons, lozenge-shaped pieces of black cloth, or velvet, with the arms, name, and date of the death of the deceased, were exhibited on the front of the house. And since there is little to be said of women, except on their marriage or death, for this reason has it become customary on all occasions to use for them the lozenge-shaped shield." The most popular theory is that which represents the lozenge to be typical of the ancient spindle, formerly so much used by ladies. There is also a tradition extant which asserts that whenever a Roman warrior found a shield unfit for use, he transferred it to one of the gentler sex, who was permitted to place her ensign

upon it, providing that one corner was always uppermost. And, while some antiquarians believe the lozenge to have had its origin in the use of hatchments, others consider it to be due to the circumstance recorded by Plutarch in his "Life of Theseus," that in Megara, an ancient town of Greece, diamond-shaped tombstones were placed over the bodies of deceased Amazons.

In reference to the royal arms the uninitiated may be glad to know that they are not the family bearings of the royal family, but the arms of England; and that, by the laws of heraldry, no person, be his or her station what it may, can use or quarter those insignia without adding some difference, *i.e.*, an additional charge, or ensign. The supporters in the royal arms, of a lion and a unicorn, have been borne uninterruptedly by successive sovereigns since James I, but the arms in their present form have only been borne by her Majesty, as, on her accession to the throne, the arms of Hanover were removed from the shield. Concerning the supporters, a very popular error appears to exist among artists, as these persons frequently draw them in a couchant, instead of an erect position. Whenever, therefore, the lion and the unicorn are displayed seated or lying down, the emblazonment is incorrect.

The income derived by the Government from the tax on armorial bearings has been materially augmented during the last few years, and there is an evidently increasing desire among the community to bear arms. In modern heraldry, however, the incidents connected with the grants of arms are mostly of a prosaic character, and oftentimes partake more of the ludicrous than the sentimental. As an instance of this, we may mention that within the last few years a successful city merchant applied at Herald's College for a grant of arms. The device he desired to bear was a pile of shot proper, upon an argent (silver) field, and for a crest a black deerhound. These arms were duly granted to him, and he then explained that his only object in making such a selection was due to the circumstance that on his road to the college he had seen a pile of shot shining brightly in the sun, and had also admired a stranger's dog of the species described. Future generations will probably believe that the arms indicated were granted to some brave ancestor who achieved renown for his skill as an artillery officer, while the crest may be supposed emblematic of faithfulness, watchfulness, or swiftness. Another modern anecdote is worthy of being recorded. In 1832 the Lord Lyon of Scotland issued a notice that all persons illegally using armorial bearings were liable to have confiscated all their plate, carriages, and other articles on which they were depicted or engraved. Apropos of this, a few years subsequently, much ridicule was passed on a well-known citizen of Glasgow. He was an ironmaster who, having suddenly become wealthy, purchased a handsome equipage, on which were painted the former owner's armorial insignia and supporters. Continuing to prosper, he bought a newer and handsomer carriage, on which he deliberately ordered to be copied the arms that appeared on his former purchase. Information being laid at the office of Lord Lyon, an order was promptly given for the removal of the ensigns, a circumstance that caused him to become the object of much ridicule.

If the above-mentioned fact is not strictly romantic, it is as much a curiosity as the under-mentioned legend is a portion of the poetry of heraldry.

Hamon de Crève-Cœur, Lord of Chatham, and ancestor of the families of Hayman and Heymen, attended Richard I to the Holy War, accompanied by his three noble sons. These youths distinguished themselves by

their gallantry at Acre and at Joppa, but shortly after, at the yet more desperate fight of Ascalon, the unhappy father saw his children killed one by one. Bowed down by grief, he was sufficiently strengthened by hope and confidence in the right to rally his scattered spirits, and to continue, both with counsel and hand, to fight manfully against the enemy. Yet was his heart sad. All thoughts of earthly pride deserted him, and when a truce was agreed upon between Richard and Saladin, he returned to his native land childless and almost heart-broken. Yet was he not entirely without comfort, believing, in the mistaken spirit of those times, that all who fell fighting against the followers of the "false prophet" were certain to reach the goal of heaven. In order, therefore, to express his sense of abasement, bereavement, and confident hope, he made an alteration in the bearings of his shield. His arms had previously been on a field or, three chevronelles gules, but he changed them to a field argent charged with a chevron between three martlets sable. He thus expressed by the field that he no longer delighted in earthly glory, but rather wished to walk beneath the calm, pale skies of humility and peace. The proud gold of his shield was thus altered into the meaner silver, while the martlets, those birds of passage, which, like the birds of paradise, cannot alight on earth, denoted by their number the number of his sons, and, by their character, his belief that the lost champions had but deserted earth for heaven. This was also further indicated by the motto "*Cælum non solum*" (Heaven not earth).

To King Robert Bruce tradition attributes the grants of numerous armorial bearings, the circumstances connected with which are replete with interest. One of these refers to an incident that occurred to him shortly prior to his victory at Bannockburn, and during the period when he was being hunted as a fugitive in the islands and western portions of Scotland. Upon one occasion he was pursued so closely, that he would have been killed, or taken prisoner, had not two men, named Torrance, given him some timely aid by rowing him in their boat over a frith, or arm of the sea, and so enabled him to escape. The allusion to this service is obvious, both in the arms and in the motto now borne by the Torrance family, viz., on a field per pale gules and or, two boat's oars in saltire azure, with the motto, "I saved the King."

The ancient family of Sprotts, resident at Urr, also owe their position and armorial bearings to a favour rendered to the same monarch by a female ancestor. Indeed, they hold their lands, a portion of which is called the King's Mount, subject to their presenting to the Scottish monarch, for the time being, a dish of "butter-brose" whenever he, or she, passes Urr. In reference to this peculiar tenure the following legend is extant:—About the year 1309, when Robert was obliged to wander about from place to place with a small band of devoted followers, he was attacked in the wilds of Galloway by a troop of English cavalry under the command of Sir Walter Selby. The number of combatants was about equal, and the battle took place near the cottage of a soldier-herdsman named Sprott. The fight was so severe, that, with the exception of the commanders, all engaged in it were stretched on the ground dead or wounded. The King and Selby, however, continued to hew away at each other in a most furious manner, and the clashing of their swords excited the attention of Sprott's wife. This woman was both bold and shrewd, and, having an intuitive feeling that one of the two knights was a Scotchman, she naturally desired to assist her countryman; but, as the vizors of both combatants were down,

she was unable to distinguish them. The conflict continued to rage without advantage being gained by either party. At last, however, Bruce dealt his adversary a blow which, though it staggered, did not fell him. Selby, goaded by the blow he had received, uttered an imprecation in Norman-Saxon, and prepared to return the compliment. He reckoned, however, without his host, as dame Sprott, distinguishing him by his accent as a Southron, sprang upon him, seized a lock of hair which hung from his helmet, and pulled him down upon his back. The fallen man was compelled to yield, and, from the dialogue which ensued between the victor and the captive, the heroine of the cottage discovered that she was in the presence of her king. She accordingly invited him to her dwelling, and on his arrival there she offered him some butter-brose for breakfast, a repast that was willingly accepted, inasmuch as he had scarcely tasted food for three days. Although liberal with her food to Bruce, the bold woman intimated to Selby, in terms by no means complimentary, that he should not be regaled by her, and, saving the king's presence, she would have thrown the brose into his face. Resisting the entreaties of the monarch, she persevered in this resolution, until the good-humoured Bruce, partly to prevent his captive from going without food, but chiefly to reward her loyalty and daring, thus addressed her: "All this land, both hill and dale, is mine, and I make thee lady of as much of it as thou canst run round while I am eating my breakfast. The brose is hot and the bowl is large, so kilt thy coats and run." She accordingly tucked up her coats and started off at full speed. Quickly did she run round the hill, and round the holm, cogitating on the probability that during her absence the generous Bruce would not fail to impart a portion of his breakfast to the hated Southron. Comforting herself, however, with the consideration that no two men could possibly empty the bowl, she completed the circle which she had proposed to herself, and kept exclaiming somewhat loudly, "No doubt we shall be called the Sprotts of the Mount Urr, while Dalbeattie wood grows, and while Urr water runs, and the tenure by which we shall hold our lands will be the presenting of butter-brose to the kings of Scotland, when they chance to pass the Urr." King Robert, overhearing her, said, "On thine own terms, my brave dame, shall the Sprotts of Urr hold this heritage." And King Robert's bowl, as it is called, is still preserved in the Sprott family, and in their arms is a royal crown, a bearing conferred upon them by the grateful monarch.

As a contrast to the foregoing will be found the charge of three chess rooks in the arms of the present Admiral Walcott, M.P., said to have been granted by Henry VII to John of Walcott, in consequence of his having been beaten at chess by his faithful subject.

The pious spirit displayed by Hamon, Lord of Chatham, in the alteration of his arms, leads us to remark, in conclusion, that many heraldic mottos have a religious or devotional origin or meaning. Such are the following, borne by some living men of note:—A cruce salus (Salvation from the cross), the Right Hon. the Earl of Mayo, M.P.; *Spes mea in Deo* (My hope is in God), Sir B. L. Guinness, M.P.; *Christi crux est mea lux* (The cross of Christ is my light), the Right Hon. Sir Stafford Northcote, M.P.; *Deus prosperat justos* (God prospers the just), Sir W. Heathcote, M.P.; *In te, domine, speravi* (In Thee, O Lord, I have placed my hope), Col. W. Meller, M.P.; *Omne bonum ab alto* (All good is from above), Sir F. Crossley, M.P.; *Vive revicturus* (Live as one about to live hereafter), Col. H. H. Vivian, M.P. And many more might be quoted.

AMONG THE INDIAN WIGWAMS.

THE MORTONS OF MORTON HALL.

BY THE AUTHOR OF "THE GREAT VAN BROEK PROPERTY."

CHAPTER XXVIII. — HENRY TALBOT SETS FORTH ON A JOURNEY THROUGH THE FORESTS, AND ACROSS THE PRAIRIES OF THE FAR-WEST.

THE distance from St. Louis to the south shore of Lake Michigan, as the crow flies, or as they say in America, "in a bee-line," is about 500 miles almost due north. At the present day the journey may be easily accomplished, either by steamboat or railroad-car, in a few days. It was, however, very different at the time

of which I write, when the traveller had, during the greater portion of the journey, to penetrate through dark, gloomy forests; to cross streams often rendered unfordable for days together by floods; when there were only two or three small settlements to be met with throughout the entire distance, and when he had to trust to find rest and shelter at night in some one of the log-cabins that were scattered at wide distances, inhabited by hunters and backwoodsmen, who were hospitable when they possessed the means, but who frequently had little to share with the weary traveller.

The stages in use previous to the construction of the

present intricate network of railroads, which cross and recross the country in every direction, were rude, clumsy vehicles, mere wooden boxes of great strength, set on wheels, sometimes without springs, and drawn at an irregular pace, according to the road, by two, three, or four horses, as the occasion might require.

This was not a very pleasant prospect for the young Englishman; still, to a young man, there was a certain charm in such a precarious mode of travel. Moreover, during his passage up the Mississippi, Henry Talbot had experienced a great desire to see the wilderness of the Far-west, and to penetrate into the primeval forest. He was in possession of youth, health, and activity, and had a sufficiency of money for his present purposes. He set forth, therefore, in high spirits, and at the end of four days' travel by stage reached Springfield, Illinois, since become famous as the residence of the late President Lincoln, and the present capital of the State, but then a small, newly-founded settlement, situated in the midst of extensive prairies.

From Springfield he continued his journey on foot to Illinois city, at that period the only other settlement of importance in the State, and nearly 200 miles distant. His journey, however, was over level prairie-land, occupied by numerous isolated settlers, whose cabins were from five or six to twenty miles apart. He therefore experienced no great hardship, since he could always be sure of reaching some settler's cabin by the time he began to feel fatigued, where he was equally sure of a glad and hearty welcome from its owner.

When, however, he entered the densely-wooded State of Michigan, the travel became more fatiguing as the scenery grew more interesting. He had been twenty-four days on his journey, and during that period had slept in the open air at least one-third of the nights, when, from an eminence, he caught his first glimpse of the vast sheet of water from which the State of Michigan derives its name.

Beneath his feet, but a short distance off, and near the shore of the great lake, stood a long, low, red-roofed wooden building, constructed of unbarked logs, and only one storey in height. Scattered around were some twenty-five or thirty ordinary log-cabins, interspersed with a few Indian wigwams. Moored near the shore, or hauled up on the beach, were a number of boats and canoes of various sizes, and a few furlongs from the shore a small brig lay at anchor, her sails, which had been loosed to dry, the previous day having been showery, still unfurled, and hanging in graceful festoons from her yards.

On the beach, and amidst the cabins, some ten or a dozen men, attired in the garb of hunters, were strolling idly about, talking with one another. Two white women, to judge from their attire and general appearance, were seated at the door of one of the cabins, with their infants in their laps; half-a-dozen white children were gambolling on the beach. Near the wigwams, four or five Indians in their native costume, plentifully bedaubed with paint, and bedecked with feathers, were reposing on the turf, smoking their pipes and playing with their own dusky offspring; while, as usual, their squaws, attired in coarse blue blankets and red leggings, presenting a marked contrast to their gaily attired lords, were employed in bringing in firewood, or preparing the evening meal.

The spot upon which Henry Talbot now looked down was Chicago, at that period a mere trading-post, from which hunters sallied forth to hunt the buffaloes on the distant prairies, and whither white trappers and red men came periodically to dispose of their furs.

The sun was just beginning to dip beneath the translucent waters of the lake as the traveller reached the brow of the hill. Hitherto, throughout his journey, the forests or hills, or some other intervening object, had limited the range of his vision at the hour of sunset; but now, the sheet of smooth, glittering water that lay extended beneath his feet appeared to stretch to the verge of the remote horizon. The atmosphere was remarkably clear after the rain of the preceding day, and the sunset was glorious, so different from anything he had been accustomed to see, unless on very rare occasions, in the misty atmosphere of his native land.

At the present day Lake Michigan* is navigated by scores of steamers, propellers, and sailing vessels of every description. Railroad termini abound on its shores, and telegraph wires form a net-work around it. But at the period of which I write, and even to a much later date, only two or three small brigs ploughed its lonely waters; and, except in the vicinity of the settlements, its sandy shores were rarely visited save by some solitary hunter or trapper, or some red Indian with his squaw and children, who erected his wigwam on some chosen spot, that he might occupy himself awhile in hunting or fishing in the neighbourhood.

For some minutes Henry stood gazing silently and thoughtfully upon the novel scene. But for the little busy spot immediately beneath him, he might have fancied that he stood alone, where as yet the foot of man had never trod since the creation. Darkness was gradually, yet perceptibly creeping over the waters of the lake, and one after another the more distant objects disappeared beneath its cover. Not a sound was audible, save the occasional scream of some water-fowl, and the melancholy monotonous chorus of the bull-frogs from amidst the sedges.

At length the sun dipped beneath the distant horizon, and again he turned his gaze upon the little settlement at the foot of the hill, itself now almost lost to view in the deepening twilight.

The inhabitants had retired to their cabins, from which lights began to gleam, and to cast their reflection on the water; and, just as he commenced descending the declivity, he was startled by the clang of the bell on board the brig, which announced that it was eight o'clock, and sounded wonderfully strange amid the solitude and silence which reigned around. As he descended the hill, however, he began to give some thought to his own personal appearance.

Sleeping in a woodman's hut on a heap of skins, or in the open air, night after night, and pushing his way through thickets of brushwood, and fording rapid streams, day after day, for nearly a month, taking his chance of rain or sunshine as he travelled onward, had not improved the condition of the only suit of clothing he had with him. His cloak, coat, and trowsers, new when he quitted St. Louis, and made of stout and serviceable cloth, were begrimed with mud and dust, and worn almost threadbare. His broad-brimmed felt hat was crushed out of all semblance of its original shape, and stained of many colours by the sun and rain; while he possessed but one more change of clean linen, which it was necessary that he should retain until he drew near his ultimate destination. His shoes, how-

* Until the year 1831 Chicago continued to be a mere trading-post, hardly known save to the settlers on the shores of Lake Michigan. In 1846 it began to increase rapidly in extent and population, and in 1854 it had become a city of 60,000 inhabitants, with 7,027 dwellings, 54 schools, 61 churches, and 196 manufactories. Ten years later, in 1864, the population had doubled, and it is now the largest and most thriving city of the North West.

ever, were worst of all. They too had been new when he started on his journey; but now the wet and the sun together had cracked and split the upper leathers in every direction, while the soles and heels were almost completely worn out. He certainly did not present a very creditable appearance, and in England would have stood a fair chance of being apprehended and placed in the stocks as a vagrant. However, he bethought him that he was in a country in which the outer garments of a traveller attract little attention. If a traveller through the backwoods possess garments to protect him from the cold or rain, it is all that he requires. So, casting aside all thought of his dress, he slowly continued his descent, wearied with an unusually long day's journey, and soon entered the settlement. He passed a wigwam, the curtain of which was still raised, and, looking in, saw that the man was asleep. The squaw, however, looked up from the mat upon which she was reposing as he passed by; and the "papoose," suspended from the triangle in its curved, bark cradle, kept its large black eyes fixed upon him as long as he remained in sight.

Another Indian, as he passed on, bade him "Sago, sago" (the customary Indian salutation), and turned into his wigwam without further remark, supposing him to be a trader on a visit to the settlement; and a few more steps brought him to the cabins of the white settlers. Now the dogs gave the alarm at the approach of a stranger, and a chorus of loud barking roused the traders, who had not yet lain down to sleep. The men came to the doors of the cabins, and gave the customary challenge—"Who comes here?"

"A friend," replied Henry.

"Whar from, friend?"

"From St. Louis, bound to the lake shore farther north."

"What's yer trade, stranger?"

"I have no pelfrey. I'm on a visit to the settlement at Watertown."

A few more questions were asked and answered, and the weary traveller was invited into the largest cabin to repose for the night. The neighbours came in to learn all the particulars of the stranger's journey, and the news he brought from St. Louis; and while the females, who were the wife and daughter of the keeper of the trading-post, prepared supper for their guest, the trader brought forth a demijohn of whisky, and produced tin pannikins and water, and after bidding his guest to help himself, extended the same invitation to the company generally. Hard drinking, however, is not usually a besetting vice of backwoodsmen. It is necessary for them to be ever on the alert, and drunkenness would soon unfit them for their calling. All, therefore, were content with a moderate potation, to drink welcome and success to the stranger; and when Henry Talbot had eaten heartily of the venison-steaks the women soon set before him, a bear-skin was given him for his bed, and he at once retired to rest, and soon afterwards profound repose rested upon the lonely settlement, where, at the present day, the busy hum of human activity never ceases by day or night.

CHAPTER XXIX.—THE JOURNEY FROM THE TRADING-POST OF CHICAGO TO THAT OF MILWAUKIE.

THE remainder of the journey to Watertown was, as Henry Talbot was informed, very fatiguing, the path leading across morasses and through dense forests, while the settlers' cabins were few and far between; and as he had yet more than fifty miles to travel, he gladly accepted the invitation of his new friends to remain and rest for a day or two at the trading-post.

As a matter of course, they soon discovered that their guest was an Englishman, and also, as a matter of course, they were very anxious to persuade him that everything he saw or met with in America was immeasurably superior to anything of the kind in England or any other part of the world.

"Waal neow, I dew expect," said the master of the station, while he and Henry were strolling along the shore of the lake the next morning—"I dew expect es this yer grand kintry o' eourn whips all creation. I reckon *you'll* allow *that*, stranger? Look tew this yere lake, neow. I har es in the old kintry they arn't got no lakes es is bigger nor puddles, nor no rivers es is worth speakin' on 'longside o' eourn. I guess heow you'll be flabbergasted, *sourne*, when yer larn es old Michigan is on'y won o' half a dozen big lakes—lakes o' fresh water, mind yer. None o' yer salt-water pison, es arn't fit for nothin' but tew sail ships on."

"I have heard and read of the great American lakes," replied Henry. "Still, I grant that no one can form any correct impression of their vastness nor of their beauty without having seen them."

"I reckon he'd be a moosical sorter coon es could," returned the trading-master. "That ar brig yer see yonder, hev fought agin es heavy gales o' wind, I've hard say, es ever blowed on the Atlantic. When it blows on the lake, it *dew* blow rattlesnakes, I kin tell ye—nothin' shorter. And then, stranger, look tew eour mountins, eour peregaries, eour forests; look tew eour sile, which stretches eout west tew the settin' sun; look tew eour produce, eour manufacturs; look tew the bright sun, which shines deown upon us, and *say*, stranger, ef we arn't an everlastin' tall people?"

Henry acknowledged that the Americans had much to be proud of; and, at length, satisfied on this all-absorbing subject, the trading-master began to question the young man relative to his own private affairs.

"So you'm come tew settle deown on this yere sile o' freedom, eh Mister? Druv eout from hum by tyranny, I expect?"

"I came from England in the hope to benefit myself," replied Henry. "Whether I remain in America or return home will depend upon circumstances. As yet, I cannot say that my anticipations have been realised, nor do my future prospects appear very bright."

"Just like yew Britishers. Never will allow tew the trewth. Allers *air* riled at the overshadderin greatness of eour glorious kintry, and eour everlastin' institutions."

"Ef yer don't like what yer see, why don't yer stay tew hum 'long o' the deown-trodden millions of Europe?"

"*Saay*, stranger, hev yer got any money wi' yer? Ef yer hev, never wor a better time fur layin' on it eout in land."

"The little money I brought with me from England was lost, with all my other effects, in the Gulf of Mexico."

"*What on airth* be yer goin' to dew to Watertown ef yer h'a'n't got no money, friend?"

"I am going to seek for employment. I may not, however, remain there long. I shall probably travel eastward towards the Atlantic States. My present object is to seek some persons of the name of Aston, who have been settled in the neighbourhood of Watertown for many years. Perhaps you may be able to give me some information respecting them?"

"Aston d'ye say? Don't know no sich folks, friend. Stay, though—Aston! Ay, now I think on't, there war a miserable old crittur, name o' Aston, es owned all the

land a'most, 'tween Mississipp', and the lake-shore. But he've been dead many a year, he hev. His darter marr'd on tew a Britisher, name o' Morton or some sich. In coorse the land went wi' her, and when the settlements reound the lake began tew spring up, and they got tew puttin' vessels on tew the waters of old Michigan, this yere Morton got tew be very rich. He owns Watertown, and all the land along the lake-shore, north tew *Fond de lac*, they say, and I hev heard heow he hev a son and darter; but I never seen none o' 'em."

"Morton!" exclaimed Henry. "Still," he continued, "there may be some relation of the old man of whom you have spoken yet living?"

"Not 'long the lake-shore, old hoss, I reckon.

"I kalkilate heow I know the name o' every settler 'long the shore up tew Green Bay, and there arn't no single coon o' the name o' Aston 'mong 'em all."

"I must be mistaken, then," replied the young Englishman. "Still, I should like to see these Mortons. They own some of the vessels on the lake, perhaps?"

"The old man *dew*—own pooty consider'ble nigh the hull on 'em. Ef yer a mind to try yer luck on board won o' *them*, yer can't dew better, friend, than tew curry favour 'long o' old Morton."

"He is still at Watertown?"

"He arn't nowheres else es I knows on, Mister," replied the trading-master; and so the conversation ended, and on the following morning Henry Talbot again set forth on his journey.

His conversation with the trading-master, however, furnished him with food for strange thought. He recollected now that the merchant at St. Louis had on more than one occasion spoken of a Mister Morton, when alluding to Mr. Aston; and it was very singular that this Mr. Morton should in every respect answer to the description of Mr. Aston, as well in regard to his property as to his family, and that he should have inherited his wealth through his marriage with the only child of Mr. Aston—the original owner of the property. Already he began to entertain a suspicion that Mr. Aston and Mr. Morton were one and the same person, and that both were identical with his old friend of St. David, since, as there was little communication between the settlers who lived at wide distances apart on the lake shore, it was not at all improbable that the trading-master had not yet heard of Mr. Morton's departure for England.

He also thought it strange that—if his suspicions were correct—Mr. Morton should bear the surname of his (Henry Talbot's) mother's family, and that he should wish to conceal his name from his friends in England. He recollected the marked kindness with which the *soi-disant* Mr. Aston had treated his sister and himself, after a very brief acquaintance; and he began to wonder whether there really was any connection between them. Perhaps some suspicion of the truth already existed in his mind; but, as he expected to reach Watertown in a few days, and might then discover that the trading-master was not so well informed as to his neighbour's affairs as he professed to be, he would not allow his suspicions to acquire a firm hold of his mind, until he should reach his destination and learn the facts himself.

was the most solitary portion of his long journey. The direct distance he had yet to travel was but sixty miles; but his progress was necessarily slow, owing to the number of tributary streams running into the lake, which he had to cross, many of which were not fordable for some distance from the shore. He often wished he had adopted the practice of the Indians, and brought with him, strapped to his back, a light bark canoe, which he could have launched at any moment, and taken up again when he had crossed the stream. He would thus have saved himself many miles of weary travel.

There were at that period few settlers on the lake-shore between Chicago and the next trading-post, and for three days he did not come across a hut or cabin, nor meet a solitary human being. Wandering on, hour after hour, day after day, he felt himself, as it were, the sole inhabitant of an apparently depopulated world. The lap of the water, as it broke in tiny waves upon the sandy shore, and the solemn note of the solitary bittern, as it rose from the sedgy marshes, were the only sounds that broke the awful stillness of nature for hours together. Strange thoughts and fancies sometimes occupied his mind as he lay awake at midnight, stretched beneath the spreading branches of some forest tree, and gazed through the quivering foliage at the canopy of heaven, appearing, as seen through the clear atmosphere, at a vastly greater distance from the earth than it had ever appeared before to his eyes, and studded with myriads of glittering stars, which seemed to shine with tenfold greater brightness than they shone "at home;" for there were visible the same constellations that he had so often gazed upon from the garden of his parents' residence in Wiltshire, four thousand miles distant.

It is no marvel that the aborigines of America, dwelling from infancy amid the silent forests, possessed a religion, which, with all its errors, was more impregnated with a feeling of awe and reverence of the great Father of Spirits than the religion of any other savage race. No marvel that they felt the *presence* of the *Manitou* in the howling of the wind amid the forest trees, in the roar of the cataract, in the drear solitude of the mountains, the gloomy depths of the valleys, or the awful silence of the forest in the midnight hour.

The lonely hunter or backwoodsman, isolated from his fellow man—rude and uncultivated as he is—is almost universally impressed with religious feelings, quaint and imperfect, and imbued with his own peculiar prejudices though these feelings be. Far more calculated to impress the mind with feelings of awe and veneration than the grandest cathedrals erected for the services of religion by men's hands, with all their swelling music and pomp of worship, are the vast solitudes of ocean, with the solemn murmur of the winds, which come from afar and sweep with mournful cadence over the vast expanse of heaving billows; the dark, gloomy forest at midnight, with the mysterious whispers of the breeze amidst its foliage; the loud rolling of the thunder amid the mountain passes; while the vivid lightning illumines the valleys with its vivid glare; or the roar of the mighty cataract that causes the earth to tremble. It was not without reason that the keeper of the trading-post had boasted of the greatness of his native land.

The most striking peculiarity of American landscape, whether in the torrid, temperate, or frigid zones, is the "vastness" which is characteristic of its every feature. Other portions of the world may, and assuredly do, possess a greater variety of charming scenery within limited spaces; but the western hemisphere possesses (with the exception of a few isolated peaks of the Hima-

CHAPTER XXX. — HENRY TALBOT ARRIVES AT THE TRADING-POST AT MILWAUKIE, AND PROCEEDS THENCE TO WATERTOWN.

HENRY TALBOT would now have gladly pursued his journey through the forest; but, fearful of losing his way, he still kept the path along the lake shore. This

layahs) the loftiest and longest mountain ranges; the widest, longest, and most rapid rivers; the greatest expanse of lakes; the mightiest waterfalls; the most extensive meadow-lands, or prairies, and the largest and grandest, and, I may add, the most gloomily-picturesque forests in the world. In no other situation—save, perhaps, amid the solitude of the ocean at the midnight hour—is the mind so liable to be impressed with the majesty of creation, as when the traveller finds himself, for the first time in his life, alone in the heart of one of these vast, silent forests.

Strongly as he had been inclined to venture, Henry Talbot had never yet penetrated into the depths of the primeval forest that now covered the soil over which he sped his way. He still kept the lake shore, and at the end of the fifth day arrived at the trading-post which then occupied the site of the now thriving lake port of Milwaukie. It presented a similar appearance to that which he had lately quitted, though, Milwaukie occupying a more central position on the lake shore, the shipping interest was better represented. Off the port two brigs and five schooners lay at anchor, and several fishermen and Indians were plying their calling in boats and canoes.

Although Henry carried a knapsack to contain provisions for his journey, which he replenished at every opportunity, always contriving to procure a small supply from every settler with whom he put up for the night, it not unfrequently happened that he found himself hungry and with an empty wallet at the end of a day's journey, and such was the case at present. His first care, therefore, after he had received and returned the hearty greetings which always meet the wayfarer in the Far-west when he enters a settlement or cabin, was to satisfy his hunger, after which he was ready to respond to the customary questions relative to the object of his journey, that were put to him by the semi-amphibious, half-backwoodsmen, half-fishermen of the settlement.

"This place, you say, is Milwaukie?" he said, in response to some remark made by one of the settlers.

"Waal, stranger, 't'a'in't nothin' else, I guess."

"What is the distance from here to Watertown?"

"What on airth be you a goin' to do to Watertown?"

"I wish to find some people of the name of Aston. But I asked you the distance hence to Watertown."

"Goin' tew Watertown to seek arter owd Aston, whom bin dead nigh on tew twenty year! But don't yew get riled, stranger, when you're arxed a civil question. Watertown's 'bout twenty mile off, right slick threw the forrest, and 'bout forty, ef yer foller the bends o' the river. But if yer want tew find owd Aston, yer'll hev to sarch for him under the sile."

"Who, then, is the proprietor of the land hereabouts?"

"Waal, I reckon heow Squire Morton owns pooty much all the sile from the lake-shore west'ard and nor'ard es fur es yer could chase a bufler in a three-days' run; but the squire's been away tew Europe nigh on tew twelvemonths, so yer wun't find him, friend. His son an' darter be tew hum, ef they'll sarve yer purpose?"

"At all events I shall go on, since I have travelled so far. The nearest road is through the forest?"

"Yer arn't nothin' else to dew but tew foller the track on a bee-line, right slick threw, ef yer kin keep it, 'till yer come eout at Watertown."

"Is it a large settlement?"

"'Tain't much more'n squire's heouse, an' won or tew log-cabins, whar the hired folk live tew. Owd Squire Aston's log-heouse used fur tew stand on the precise,

identical, parteek'lar spot whar Squire Morton's big heouse stands neow. Squire Morton's made a pile o' money, he hev. All these yere vessels yer see, an' pooty nigh all the vessels on Lake Michigan, and most o' the land 'long the sou-west shore, belongs tew him, I reckon. 'Twar a lucky spec' fur him when he marr'd old Squire Aston's darter."

Here the conversation ended, and Henry was now pretty well satisfied that Mr. Aston and Mr. Morton were one and the same individual. He resolved, at all events, to seek Mr. Morton's son at Watertown, and, by questioning him, to make it certain that his suspicions were correct. This he thought he could manage without betraying his own acquaintanceship with the *soi-disant* Mr. Aston of St. David.

Could he have made his appearance at Watertown in a decent garb, and in an independent condition, he would not have hesitated to ask for an explanation of the apparent mystery. But in his present condition, with an almost empty purse, with soiled and tattered garments, almost shoeless, tanned by the sun to the colour of an Indian, and in search of employment, he was doubtful whether his professed intimacy with the father would be agreeable to the son and daughter.

At all events, he thought that if Mr. Morton really owned most of the vessels on the lake, it was probable that he might obtain from the "young squire"—as the son was styled by the settlers—the employment he was seeking. So he remained at Milwaukie until the next morning, and then, having donned his last change of clean linen, and done his best to make himself as presentable, or rather, I should say, as little like a scarecrow as was possible under the untoward circumstances, he set forth at an early hour, and took the forest path towards Watertown.

THE GOLDEN RULE.

PERHAPS there is no rule so little used and so much abused as the one, "Whatsoever ye would that men should do to you, do ye even so to them;" or, to put it into household English, "Do as you would be done by." Where many decline to act, or find some excuse for not acting upon it, most are ready to complain when it is neglected by others in the treatment of themselves. Whatever any one thinks or does, it is always and clearly his neighbour's business to keep this rule. It is indeed counted "golden" by all, being often considered too precious to be spent or bestowed on another, and yet such as every one wishes to be applied to himself.

I have said that there is no rule so little used and so much abused. Let me try and make this clearer by illustrating both sides of my assertion. First, let us look at the neglect of it. We too often make ourselves the centre of our consideration. There is a vile Dutch proverb, expressing, some may think, the secret of that nation's thriftiness, which says, "Self is the man." But I fear it has a wider application than the limits of that people. Look at the ruling motive of, I might say, all commerce and trade, great and small—Buy in the cheapest, and sell in the dearest market. Well. Men of business must live; and yet, surely Christian men of business should look not only at the profit they can make by legitimate trading, but at the essential equity of their transactions. There is many a stroke of business done which is defensible by the established laws of commerce, but which, judged by the highest morality, that of the Golden Rule, is very questionable, to say the best of it. Take an example. A picture-dealer sees

a dingy-looking portrait in a poor broker's shop, ticketed a few shillings. His experienced eye perceives that it is worth many pounds. Now, he is permitted by the laws of trade to reap the benefit of his knowledge, and make five hundred per cent. of his purchase. But, however little the small broker may have paid for the picture, it is evident that he thinks it of little value, by the slight profit he proposes to make by its sale. Now, how ought a scrupulously honest man, who wishes to do as he would be done by, to treat the little broker? Shall he buy the picture at its paltry price, carefully concealing his perception of the prize he has found, or pay such a price as would leave himself only a fair profit? How about the rule, "Do as you would be done by?"

I have taken a solitary case. But there arise many analogous ones in all businesses. How can a Christian trader take advantage of another's ignorance? It is, I grant you, a complicated question. Directly we enter into it we seem to be half stifled by the bewildering atmosphere of casuistry. I doubt, however, whether commerce is not often sorely poisoned, and the moral sense of many who live by it confused by much legitimate sharpness. There is all the difference between regular trading, in which commercial skill gives one dealer a superiority over another, and chance opportunities for a special bargain which are perceived by a shrewd man. Must he try to discriminate between the advantages which educated experience gives him, and those which arise from the exceptional ignorance or embarrassment of another? Surely he ought, according to the Golden Rule. It would not spoil the good savour of his name, the steady progress of his business, and the accumulation of his money, if he refrained from making more than a fair market gain out of each transaction he engaged in. A really great bargain generally involves a really great loss by some unfortunate man who is in a corner. Now, may his special perplexity or inexperience be made into capital by a Christian man of business? Depend upon it, the Golden Rule must come in here. Never mind whether the custom of trade permits the bargain. There is a higher law, which hinders no fair profit, but ever raises its protest against these "strokes of business."

We have hitherto looked at the application of our rule in the conduct of the larger transactions of trade and commerce. It is equally needful, and I fear equally neglected, in common craft and handiwork. What is the custom of "making the most of a job," as it is called, but an expedient for getting more money out of an employer or customer than he wants to spend? How difficult it is to get rid of a workman out of your house when once he has begun to make some chips and noise there! He is a good sort of fellow, no doubt, honest, sober, industrious, after his fashion; but how obvious his effort to spread the job over as wide a space and time as he can! How he potters, mislays his tools, goes to "shop" to fetch this, that, and the other! How persistently he forgets to finish up! You seem powerless. He is such a civil man to talk to, and appears so interested in his work; is so suggestive, intelligent, and skilful, that you hardly know how to complain. And yet, you are sure that he is needlessly spinning out the business in hand. You long to get rid of him: he knows you do. Nay, you tell him so, and he responds with a smile. The fact is, your interest of itself is nothing to him. Of course it is his interest that the work should be well done, that the credit of the trade should not be lowered; but as long as he fulfils the requirements of his craft, he imposes himself upon you with a tedious persistency, which makes many a householder dread the very sight of an "intelligent artisan" within his doors.

After a civil inaccessible fashion he systematically declines to act on the rule, "Do as you would be done by." This is a small matter, one may think, and must be made the best of; but it is not a wholesome thing that large numbers of respectable men, clever and steady at their trade, should, apparently on principle, ignore the convenience and legitimate wishes of those who employ them, looking at their work simply with an eye to make it go as far as possible, and produce the most pay at the least pains, quite irrespectively of the wants and purpose of the person for whom the work is done.

In handiwork, as in commerce, we must admit that there is a serious neglect of the Golden Rule. The illustrations I have given may suggest others to those who know anything of business. The same selfishness crops up in a hundred shapes. We see the spirit of the Dutch proverb, "Zelf is de man." "Self's the man," in more English work than one likes to think of. Indeed it is rendered, in our language, by one which is even worse than the other, inasmuch as it presents itself with an air and in a dress of piety, saying, "Every man for himself, and God for us all"—an utter perversion of, or rather, I should say, radical opposition to, the Christian order of obedience, in which the first commandment is duty to God, and the second to our neighbour, self being left out altogether as a chief object of our work—the concluding moral of a discourse about the law being, therefore, "Whatsoever ye would that men should do to you, do ye even so to them."

I need hardly say that a neglect of the Golden Rule is by no means confined to commerce, trade, and handiwork.* It infects more than our relation to strangers in the current business of life. It creeps into the household, and keeps up those little sores which are too often the curse of a family, the fly in the ointment of home love. It is not only master and servant, mistress and maid, that often forget to do as they would be done by, failing in that mutual consideration which alone keeps the wheels of the family waggon greased; but in the kitchen and the parlour, round the fire and the table, the neglect of the Golden Rule, in home chat, and in the interchange of those little duties which are too small and too many to be reckoned up on paper, lies the difference between domestic happiness and discomfort. Try it, my friend. Just make it a special aim for one day to study the ease and convenience—nay, the little harmless whims and fancies, of your own home circle. Contrive to check the querulous or caustic expression of your own opinion. Be ready to hear what others say, and to take interest in what interests them. You will see a result, probably at once. You will feel your humour react upon yourself. It is catching as well as cheering. Suppose you find some one specially pleasant. You can't say exactly what he or she has done to make pleasantness; but something—some influence has flowed in upon you which makes you see things in a better light, and judge them in a gentler temper. You have been treated as you wish. You have been done to as you would in the little matters of home. You have felt kindness. You have enjoyed the application of the Golden Rule in small things. Well, it is in your power to communicate to others the pleasant sensation which you have felt yourself. Try it. Try it fairly, honestly, and you will find that you possess a very talisman, a source of cheery

* A happy application of the Golden Rule was made by Mr. Adams, the American minister, in replying to an Address, on his much-regretted departure from this country: "I believe," said Mr. Adams, "the sum of all true diplomacy is to be found in the Christian maxim of doing unto your neighbour that which you would he should do unto you. If all nations were to carry that into practice there would be no wars to follow controversies and disputes."

atmosphere, which will make you feel twice as rich as you were before—nay, will really make you richer, for you have so far been in receptive contact with the rich Spirit of grace, who sheds his influence not only in those mighty works which move a people, but does not forget the lesser charms of life, any more than the sun which sheds its light and warmth upon a crowd of worlds, fails to tint and cheer the daisy on a lawn. You have so far been in receptive contact with the Spirit whose law is “All things whatsoever ye would that men should do to you, do ye even so to them.”

But I have said that there is no rule more abused than the Golden one. Let us look at this side of the matter. If we are to do as we should be done by, we must wish to be “done by” honestly. No law of the Lord is over-ridden by falsehood or injustice. Right must ever be the root of the Golden Rule.

Of course the case of a thief, who might wish me to drop my purse in the road he was walking, and so be “done by” as he would, is not to the point I am making for, since he would be himself unwilling to drop his; but I can imagine a case in which we might seem to be keeping the Golden Rule, and yet be far from doing right.

A beggar presents himself before me in the way. I think, “Poor man, if I were he, I should be very glad of an alms,” and I give him a coin. Now, am I thus really keeping the rule to do as I would be done by? Is my act a kindly departure from the severe rules of political economy, by which we seek to check pauperism and imposture? Does not the beggar heartily desire alms? If I were a beggar, would not I desire them? Do not I do as I would be done by if I bestow them upon him? Yes, indeed, if so be that I have a beggar’s soul, or can really identify myself with one who makes it his business to live upon alms, who is willing to accept, nay, to seek, the proceeds of work solely by refusing to do any work at all. The business of the beggar is to feed upon that which is directly or indirectly the result of some one’s labour. He dislikes toil. He dislikes the restraints of productive industry, and he himself produces nothing, except it be a brood of beggars in prospective, and some increment towards the pauperism of a people, with the additional item of confusion in the sense of the word charity.

I have referred to professional beggars; but what I say has many applications. When we are asked to do as we would be done by, and our good nature, frequently the child of mere selfishness, is appealed to, we are bound to consider not merely whether, if we were in the petitioner’s place, we should like to have our petition granted, but whether it ought to be granted. No man has a right to expect his desire to be granted unless he desires what is just and right. We must ask whether the person who wants help considers himself alone in his prayer. If he considers himself alone, we merely encourage selfishness by granting it. We promote that very vice which causes the right use of the Golden Rule to be neglected.

There is room for much more kindness in the world, but there is daily proof that much apparent kindness, such as is often received with profuse thanks, is really not true kindness, but the stimulant of mischievous dependence.

Let us, then, not suppose that the Golden Rule is kept by a mere compliance with the wishes or importunities of others. He who gave it did, according to the record of his work, by no means gratify the requests of all who appealed to him.

While, therefore, we may do wrong by yielding to

selfishness in our refusal to act upon the Golden Rule, we must take care lest we overshoot the mark, and encourage by our deed that very fault which we wish to strive against ourselves. We must do as we would be done by when the deed may fairly be demanded of us, but we must not do as we would be done by when the petitioner is unjustified in his request.

THE QUEEN’S JOURNAL.

II.

CONTINUING our extracts from the Queen’s book,* we give the first impressions of Balmoral:—

“Balmoral, Friday, Sept. 8, 1848.

We arrived at Balmoral at a quarter to three. It is a pretty little castle in the old Scottish style. There is a picturesque tower garden in front, with a high wooded hill; at the back there is a wood down to the Dee, and the hill rises all round.

There is a nice little hall, with a billiard-room; next to it is the dining-room. Upstairs (ascending by a good broad staircase) immediately to the right, and above the dining-room, is our sitting-room (formerly the drawing-room), a fine large room—next to which is our bed-room, opening into a little dressing-room, which is Albert’s. Opposite, down a few steps, are the children’s and Mrs. Hildyard’s three rooms. The ladies live below, and the gentlemen upstairs.

We lunched almost immediately, and at half-past four we walked out, and went up to the top of the wooded hill opposite our windows, where there is a cairn, and up which there is a pretty winding path. The view from here, looking down upon the house, is charming. To the left you look towards the beautiful hills surrounding Loch-na-Gar, and to the right towards Ballater, to the glen (or valley) along which the Dee winds, with beautiful wooded hills, which reminded us very much of the Thüringerwald. It was so calm and so solitary, it did one good as one gazed around; and the pure mountain air was most refreshing. All seemed to breathe freedom and peace, and to make one forget the world and its sad turmoils.

The scenery is wild, and yet not desolate, and everything looks much more prosperous and cultivated than at Luggan. Then the soil is delightfully dry. We walked beside the Dee, a beautiful rapid stream, which is close behind the house. The view of the hills towards Invercauld is exceedingly fine.”

No wonder that the Queen became more and more attached to her Highland home, especially after the improvements which were the result of Prince Albert’s constant and personal superintendence. She thus wrote of it after eight years’ experience:—

“October 13, 1856.

Every year my heart becomes more fixed in this dear Paradise, and so much more so now, that *all* has become my dearest Albert’s *own* creation, own work, own building, own laying out, as at Osborne; and his great taste, and the impress of his dear hand, have been stamped everywhere. He was very busy to-day, settling and arranging many things for next year.”

On one occasion it began to snow on the day fixed for leaving Balmoral, and she almost wished they might

* In our first notice we expressed the wish to see a “People’s Edition.” The announcement has since appeared of its publication at half-a-crown. We are glad to hear that the work has been reprinted, and sold in America by hundreds of thousands. We hear, also, of translations into various languages.

be snowed-up, so loth was she to leave "the dear Highlands."

"Every little trifle and every spot I had become attached to; our life of quiet and liberty, everything was so pleasant, and all the Highlanders and people

fine hills so much. There is a great peculiarity about the Highlands and Highlanders; and they are such a chivalrous, fine, active people. Our stay among them was so delightful. Independently of the beautiful scenery, there was a quiet, a retirement, a wildness, a

BALMORAL AS IT WAS.

who went with us I had got to like so much. Oh! the dear hills, it made me very sad to leave them behind!"

liberty, and a solitude that had such a charm for us."

The Queen was delighted with these people, and chose

BALMORAL AS IT IS.

And then, on reaching England, she feels the contrast:—

"The English coast appeared terribly flat. Lord Aberdeen was quite touched when I told him I was so attached to the dear, dear Highlands, and missed the

from among them her most trusted attendants. She says, in one part of her journal, "All the Highlanders are so amusing, and really pleasant and instructive to talk to—women as well as men—and the latter so gentlemanlike." In another passage she observes, "We

were always in the habit of conversing with the Highlanders, with whom one comes so much in contact in the Highlands. The Prince highly appreciated the good-breeding, simplicity, and intelligence which make it so pleasant and even instructive to talk to them."

tralia and New Zealand, two are living in the neighbourhood of Balmoral; and the youngest, Archie (Archibald), is valet to our son Leopold, and is an excellent, trustworthy young man."

And, if Her Majesty can speak thus generously of her

GRANT HOTEL, GRANTTOWN.

From among these men she chose some of her most trusted servants. Thus, she speaks of Mr. Grant, her head keeper, in these terms:—

"He had been nearly twenty years with Sir Robert Gordon—nine as keeper. He was born in Braemar in the year 1810. He is an excellent man, most trustworthy, of singular shrewdness and discretion, and most devotedly attached to the Prince and myself. He has a fine, intelligent countenance. The Prince was very fond of him. He has six sons. The second, Alick, is wardrobe-man to our son Leopold. All are good, well-disposed lads, and getting on well in their different occupations. His mother, a fine, hale, old woman of eighty years, 'stops' in a small cottage which the Prince built for her in our village. He himself lives in a pretty lodge called Croft, a mile from Balmoral, which the Prince built for him."

She allots another note to Mr. John Brown:—

"The same who, in 1858, became my regular attendant out of doors everywhere in the Highlands, who commenced as gillie in 1849, and was selected by Albert and me to go with my carriage. In 1851 he entered our service permanently, and began in that year leading my pony, and advanced step by step by his good conduct and intelligence. His attention, care, and faithfulness cannot be exceeded, and the state of my health, which of late years has been sorely tried and weakened, renders such qualifications most valuable, and, indeed, most needful in a constant attendant upon all occasions. He has since, most deservedly, been promoted to be an upper servant, and my permanent personal attendant. (December, 1865). He has all the independence and elevated feelings peculiar to the Highland race, and is singularly straightforward, simple-minded, kind-hearted, and disinterested; always ready to oblige; and of a discretion rarely to be met with. He is now in his fortieth year. His father was a small farmer who lived at the Bush on the opposite side to Balmoral. He is the second of nine brothers—three of whom have died—two are in Aus-

servants, they were not insensible to such kindness, and could speak enthusiastically of their master and mistress. The Queen says on one occasion:—

"We then rode on, Albert talking so gaily with Grant. Upon which Brown observed to me, in simple Highland phrase, 'It's very pleasant to walk with a person who is always "content." ' Yesterday, in speaking of dearest Albert's sport, when I observed he never was cross after bad luck, Brown [said, 'Every one on the estate says there never was so kind a master; I am sure our only wish is to give satisfaction.' I said, they certainly did."

Towards her servants the Queen has always shown a spirit of kindness and consideration worthy of imitation. The usages of modern society have so widely departed from the old patriarchal system, and from the relations of feudal life, that it is only by moral influence the good order and kindly feeling of a household can be sustained. The truth of the saying, that "good mistresses make good servants," is well illustrated in the household of the Queen. Thoughtful and just treatment is met by the most faithful attachment and attentive service. This is the case in all the royal homes, and especially at Balmoral, where the loyal spirit of Highland retainership is super-added to ordinary domestic bonds.

It was at Balmoral that the Queen received the sad and startling news of the Duke of Wellington's death:—

"Alt-na-Guithasach, Thursday, Sept. 16, 1852.

We were startled this morning, at seven o'clock, by a letter from Colonel Phipps, enclosing a telegraphic despatch, with the report, from the sixth edition of the 'Sun,' of the Duke of Wellington's death the day before yesterday, which report, however, we did not at all believe. Would to God that we had been right, and this day had not been cruelly saddened in the afternoon!

* * * * *

We got off our ponies, and I had just sat down to sketch, when Mackenzie returned, saying my watch was safe at home, and bringing letters; amongst them there was one from Lord Derby, which I tore open, and, alas!

it contained the confirmation of the fatal news—that England's, or rather Britain's pride, her glory, her hero, the greatest man she ever had produced; was no more! Sad day! Great and irreparable national loss!

Lord Derby enclosed a few lines from Lord Charles Wellesley, saying that his dear great father had died on Tuesday, at three o'clock, after a few hours' illness and no suffering. God's will be done! The day must have come; the Duke was eighty-three. It is well for him that he has been taken when still in the possession of his great mind, and without a long illness; but what a loss! One cannot think of this country without 'the Duke,' our immortal hero!

In him centred almost every earthly honour a subject could possess. His position was the highest a subject ever had—above party, looked up to by all, revered by the whole nation, the friend of the Sovereign; and how simply he carried these honours! With what singleness of purpose, what straightforwardness, what courage, were all the motives of his actions guided! The Crown never possessed, and I fear never *will*, so devoted, loyal, and faithful a subject, so staunch a supporter! To us (who, alas! have lost now so many of our valued and experienced friends), his loss is *irreparable*; for his readiness to aid and advise, if it could be of use to us, and to overcome any and every difficulty, was unequalled. To Albert he showed the greatest kindness and the utmost confidence. His experience and his knowledge of the past were so great too; he was a link which connected us with bygone times—with the last century."

At Balmoral, also, in 1855, she hears of the fall of Sebastopol, and Albert, Bertie (Albert, Prince of Wales), Ministers of State, pipers, gillies, all go off to light the bonfire on the hill. Here, too, Vicky (Victoria, the Princess Royal) is betrothed to the Prussian heir apparent:—

"He had already spoken to us of his wishes; but we were uncertain, on account of her extreme youth, whether he should speak to her himself or wait till he came back again. However, we felt it was better he should do so; and during our ride up Craig-na-Ban this afternoon, he picked a piece of white heather (the emblem of 'good luck'), which he gave to her; and this enabled him to make an allusion to his hopes and wishes as they rode down Glen Gironach, which led to this happy conclusion."

Many anecdotes have been told about the visits paid by the Queen to the cottages of the poor, and her own account of some of her visits to old Highland women will be read with deep interest.

"I went into a small cabin of old Kitty Kear's, who is eighty-six years old—quite erect, and who welcomed us with a great air of dignity. She sat down and spun. I gave her a warm petticoat; she said, 'May the Lord ever attend ye and yours, here and hereafter; and may the Lord be a guide to ye, and keep ye from all harm.' She was quite surprised at Vicky's height; great interest is taken in her. We went on to a cottage (formerly Jean Gordon's), to visit old widow Symons, who is 'past fourscore,' with a nice rosy face, but was bent quite double; she was most friendly, shaking hands with us all, asking which was I, and repeating many kind blessings: 'May the Lord attend ye with mirth and with joy; may he ever be with ye in this world, and when ye leave it.' To Vicky, when told she was going to be married, she said, 'May the Lord be a guide to ye in your future, and may every happiness attend ye.' She was very talkative, and when I said I hoped to see her again, she expressed an expectation that 'she should be called any day,' and so did Kitty Kear.

We went into three other cottages—to Mrs. Symons's (daughter-in-law to the old widow living next door), who had an 'unwell boy;' then across a little burn to another old woman's; and afterwards peeped into Blair, the fiddler's. We drove back, and got out again to visit old Mrs. Grant (Grant's mother), who is so tidy and clean, and to whom I gave a dress and handkerchief, and she said, 'You're too kind to me, you're over kind to me, ye give me more every year, and I get older every year.' After talking some time with her, she said, 'I am happy to see ye looking so nice.' She had tears in her eyes, and, speaking of Vicky's going, said, 'I'm very sorry, and I think she is sorry herself'; and having said she feared she would not see her (the Princess) again, said, 'I am very sorry I said that, but I meant no harm: I always say just what I think, not what is fut' (fit). Dear old lady, she is such a pleasant person.

Really the affection of these good people, who are so hearty and so happy to see you, taking interest in everything, is very touching and gratifying."

The change from the noise and bondage and ceremony of Court life in London to the quiet and freedom and independence of Balmoral was always welcome, but even in the Highlands the Queen took delight occasionally in seeking the still more complete freedom of moving about *incognito*. The following is her account of one of the incidents of those expeditions.

"A few seconds brought us over to the road, where there were two shabby vehicles, one a kind of barouche, into which Albert and I got, Lady Churchill and General Grey into the other—a break; each with a pair of small and rather miserable horses, driven by a man from the box. Grant was on our carriage, and Brown on the other. We had gone so far for forty miles, at least twenty on horseback. We had decided to call ourselves 'Lord and Lady Churchill and party,' Lady Churchill passing as Miss Spencer, and General Grey as Dr. Grey! Brown once forgot this, and called me 'Your Majesty,' as I was getting into the carriage; and Grant on the box once called Albert 'Your Royal Highness;' which set us off laughing, but no one observed it.

We had a long three hours' drive; it was six o'clock when we got into the carriage. We were soon out of the wood, and came upon the Badenoch-road—passing close by Kinrara, but, unfortunately, not through it, which we ought to have done. It was very beautiful—fine wooded hills, the high Cairngorm range, and Ben Muich Dhui, unfortunately much obscured by the mist on the top, and the broad Spey flowing in the valley, with cultivated fields and fine trees below. Most striking, however, on our whole long journey was the utter, and to me very refreshing, solitude. Hardly a habitation! and hardly meeting a soul! It gradually grew dark. We stopped at a small halfway house for the horses to take some water, and the few people about stared vacantly at the two simple vehicles.

The mountains gradually disappeared—the evening was mild, with a few drops of rain. On and on we went, till at length we saw lights, and drove through a long and straggling 'toun,' and turned down a small court to the door of the inn. Here we got out quickly, Lady Churchill and General Grey not waiting for us. We went up a small staircase, and were shown to our bedroom at the top of it—very small, but clean—with a large fourpost bed which nearly filled the whole room. Opposite was the drawing and dining-room in one—very tidy and well-sized. Then came the room where Albert dressed, which was very small. The two maids (Jane Shackle was with me) had driven over by another

road in a waggonette, Stewart driving them. Made ourselves 'clean and tidy,' and then sat down to our dinner. Grant and Brown were to have waited on us, but were 'bashful' and did not. A ringletted woman did everything, and, when dinner was over, removed the cloth and placed the bottle of wine (our own, which we had brought) on the table with the glasses, which was the old English fashion. After dinner, I tried to write part of this account (but the talking round me confused me), while Albert played at 'patience.' Then went away, to begin undressing, and it was about half-past eleven when we got to bed."

"Wednesday, September 5.

A misty, rainy morning. Had not slept very soundly. We got up rather early, and sat working and reading in the drawing-room till the breakfast was ready, for which we had to wait for some little time. Good tea and bread and butter, and some excellent porridge. Jane Shackle (who was very useful and attentive) said they had all supped together—namely, the two maids, and Grant, Brown, Stewart, and Walker (who was still there), and were very merry in the 'commercial room.' The people were very amusing about us. The woman came in while they were at their dinner, and said to Grant, 'Dr. Grey wants you,' which nearly upset the gravity of all the others. Then they told Jane, 'Your lady gives no trouble,' and Grant in the morning called up to Jane, 'Does his lordship want me?' One could look on the street, which is a very long wide one, with detached houses, from our window. It was perfectly quiet, no one stirring, except here and there a man driving a cart, or a boy going along on his errand. General Grey bought himself a watch in a shop for £2."

Messrs. Brown and Grant were afterwards taken mildly to task for not waiting at table:—

"We mounted our ponies a short way out of the town, but only rode for a few minutes, as it was past two o'clock. We came upon a beautiful view, looking down upon the Avon and up a fine glen. There we rested and took luncheon. While Brown was unpacking and arranging our things, I spoke to him and to Grant, who was helping, about not having waited on us, as they ought to have done, at dinner last night and at breakfast, as we had wished; and Brown answered, he was afraid he should not do it rightly. I replied, we did not wish to have a stranger in the room, and they must do so another time."

From the account of the "Second great Expedition," undertaken in September, 1861, we take the following:—

"SECOND GREAT EXPEDITION—TO FETTERCAIRN.

Friday, Sept. 20, 1861.

At a quarter past seven o'clock we reached the small quiet town, or rather village, of Fettercairn, for it was very small—not a creature stirring—and we got out at a quiet little inn, 'Ramsay Arms,' quite unobserved, and went at once upstairs. There was a very nice drawing-room, and next to it a dining-room, both very clean and tidy, then to the left our bedroom, which was excessively small, but also very clean and neat, and much better furnished than at Grantown. Alice had a nice room, the same size as ours; then came a mere morsel of one (with a 'press-bed'), in which Albert dressed; and then came Lady Churchill's bedroom just beyond. Louis and General Grey had rooms in an hotel, called the Temperance Hotel, opposite. We dined at eight, a very nice, clean, good dinner. Grant and Brown waited. They were rather nervous, but General Grey and Lady Churchill carved, and they had only to change the plates, which Brown soon got into the

way of doing. A little girl of the house came in to help, but Grant turned her round to prevent her looking at us. The landlord and landlady knew who we were, but no one else except the coachman, and they kept the secret admirably.

The evening being bright and moonlight and very still, we all went out, and walked through the whole village, where not a creature moved; through the principal little square, in the middle of which was a sort of pillar or town cross on steps, and Louis read, by the light of the moon, a proclamation for collections of charities which was stuck on it. We walked on along a lane a short way, hearing nothing whatever—not a leaf moving—but the distant barking of a dog! Suddenly we heard drums and fifes! We were greatly alarmed, fearing we had been recognised; but Louis and General Grey, who went back, saw nothing whatever. Still, as we walked slowly back, we heard the noise from time to time; and when we reached the inn door we stopped, and saw six men march up with fifes and a drum (not a creature taking any notice of them), go down the street and back again. Grant and Brown were out, but had no idea of what it could be. Albert asked the little maid, and the answer was, 'It's just a band,' and that it walked about in this way twice a week. How odd! It went on playing some time after we got home. We sat till half-past ten working, and Albert reading, and then retired to rest.

"Saturday, Sept. 21.

Got to sleep after two or three o'clock. The morning was dull and close, and misty, with a little rain; hardly any one stirring, but a few people at their work. A traveller had arrived at night, and wanted to come up into the dining-room, which is the 'commercial travellers' room,' and they had difficulty in telling him he could not stop there. He joined Grant and Brown at their tea, and on his asking 'What's the matter here?' Grant answered, 'It's a wedding party from Aberdeen. At the Temperance Hotel they were very anxious to know whom they had got. All, except General Grey, breakfasted a little before nine. Brown acted as my servant, brushing my skirts and boots, and taking any message, and Grant as Albert's valet."

In the account of this second expedition, there is a note of melancholy interest. The Queen writes how Grant told her in May, 1862, that when they were returning, the Prince Consort, while giving directions as to the planting of Glen Muich, which he intended as a deer forest for the Prince of Wales, said to Grant, alluding to the finishing of the planting, "You and I may be dead and gone before that." The Queen adds, "In less than three months, alas! his words were verified as regards himself. He was ever cheerful, but ever ready and prepared." In returning, a sociable, which had belonged to the Duchess of Kent, was brought out, and vividly reminded her Majesty of the recent death of her mother, and "made her sad in the midst of much that was so pleasant."

In an account of the "Third great Expedition," we find the following amusing piece:—

"ARRIVAL AT DALWHINNIE.

At length, and not till a quarter to nine, we reached the inn of Dalwhinnie—twenty-nine miles from where we had left our ponies—which stands by itself, away from any village. Here, again, there were a few people assembled, and I thought they knew us; but it seems they did not, and it was only when we arrived that one of the maids recognised me. She had seen me at Aber-

deen and Edinburgh. We went upstairs; the inn was much larger than at Fettercairn, but not nearly so nice and cheerful; there was a drawing-room and a dining-

BRUAR FALLS, BLAIR ATHOLE.

room, and we had a very good-sized bed-room. Albert had a dressing-room of equal size. Mary Andrews (who was very useful and efficient) and Lady Churchill's maid, had a room together, every one being in the house; but unfortunately there was hardly anything to eat, and there was only tea, and two miserable starved Highland chickens, without any potatoes! No pudding, and no *fun*; no little maid (the two there not wishing to come in), nor our two people—who were wet and drying our and their things—to wait on us! It was not a nice supper; and the evening was wet. As it was late, we soon retired to rest. Mary and Maxted (Lady Churchill's maid) had been dining below with Grant, Brown, and Stewart (who came, the same as last time, with the mails) in the 'commercial-room,' at the foot of the stairs. They had only the remnants of our two starved chickens!"

In October, 1861 the Athole country was revisited:—"We passed by the Bruar, and the road to the Falls of the Bruar. The Duke of Athole took us through a new approach, which is extremely pretty; but near which, I cannot help regretting, the railroad will come, as well as along the road by which we drove, the Pass of Drum-ouchter. The duke has made great improvements, and the path looked beautiful, surrounded as it is by hills, and the foliage still full, though in all its autumn tints, the whole being lit up with sunshine. We drove through

an avenue, and in a few minutes more were at the door of the old castle. A thousand recollections of seventeen years ago crowded upon me; all seemed so familiar again. No one there, except the dear duchess, who stood at the door, and whom I warmly embraced, and Miss Macgregor. How well I recognised the hall with all the sporting trophies; and the staircase, which we went up at once. The duchess took me to a room, which I recognised immediately as the one where Lady Canining lived. There we took off our things; then went to look at the old and really very handsome rooms in which we had lived—the one in which Vicky had slept in two chairs, then not four years old. * * We got into the carriage, a very peculiar one, viz., a boat put on four wheels, drawn by a pair of horses, with a postilion. The morning was beautiful. We drove up by the avenue, and about a favourite walk of ours in '44, passed through the gate, and came on to Glen Tilt, which is most striking, the road winding along, first on one side of the Tilt, and then on the other; the fine high hills rising very abruptly from each side of the rapid, rocky, stony river Tilt; the trees, chiefly birch and alder, overhanging the water.

We passed the Marble Lodge, in which one of the keepers lives, and came to Forest Lodge, where the road for carriages ends, and the glen widens. There were our ponies, which had passed the night at the Bainoch, or Beynoch (a shooting 'shiel' of Lord Fife's). They came over this morning, but, poor beasts, without having had any corn. Forest Lodge is eight miles from

BROWN AND GRANT.

Blair. There we took leave of the dear duchess, and saw old Peter Frazer, the former head-keeper there, now walking with the aid of two sticks."

To the account of the "Last great Expedition" a mournful interest attaches. The following are the concluding sentences:—

"LAST EXPEDITION.

Wednesday, Oct. 16, 1862.

This gave one a very good idea of the geography of the country, which delighted dear Albert, as this expe-

down part of which I rode, walking where it was steepest; but it was so wet and slippery that I had two falls. We got down to the road to the Spittal Bridge, about fifteen miles from Castleton, at nearly half-past four, and then down along the new road, at least that

shone most beautifully, and we returned at twenty minutes to seven o'clock, much pleased and interested with this delightful expedition. Alas! I fear our last great one!

(IT WAS OUR LAST ONE!—1867.)"

SHEARING IN THE HIGHLANDS.

PEEPS THROUGH LOOPHOLES AT MEN, MANNERS, AND CUSTOMS.

BY CUTHBERT BEDS.

"'Tis pleasant, through the loopholes of retreat,
To peep at such a world; to see the stir
Of the great Babel, and not feel the crowd."

COWPER.

V.—GOING A-MAYING.

MAY has come, and folks are going a-Maying in various ways, and after very opposite fashions. The Maying of the town is altogether another thing to the Maying of the country. In "the season" of the former, the bursting bloom of Nature is counterfeited by the May fashions of the milliners; and all the brilliant colours that begin to show themselves in woods, fields, and gardens, are out-rainbowed in hue by the silks and satins, muslins and velvets of Kensington and Belgrave.

May in Mayfair, in the height of the season, is a scene of brilliance and fashion that is an outward sign of the wealth and nobility of Great Britain; and the roll of the thousand carriages and the clatter of the thousand horses in the Row and the Mile, and the fluttering of ten thousand bright ribbons and dresses in West-end drawing-rooms, may be accepted as a remembrancer of the trade of the country, which is sustained in so large a degree by the demand for those articles of luxury which are a necessity to the season of May in Mayfair. Court receptions, drawing-rooms, and levées make themselves felt very far down in the social scale, and contribute to the livelihood of industrious workers in almost every part of the Queen's dominions; and the return of her Majesty to a prominent position in these useful and necessary, though wearisome, ceremonials of state, has not only gladdened the hearts of many of her loyal subjects, but has revived the trade of London, which had greatly languished since the days of her sad bereavement.

Another notable feature of London at this season is the bustle of the "May Meetings," which, as means to an end, are of very considerable importance, and greatly affect the yearly revenues of the chief religious and charitable societies. The interest in such institutions is aroused, sustained, and increased by the vast gatherings held at Exeter Hall and elsewhere during the month of May. The contact of Christian men in such meetings as these seems to kindle in their hearts a sacred fire whose brightness and warmth will be felt far and wide. It will cast its light on the dark places of cruelty and ignorance, and cheer the poor and destitute with works of philanthropy and benevolence.

The majority of those who attend these May Meetings will find their way to the Art galleries in the near neighbourhood of Trafalgar Square, or perhaps will content themselves with going a-Maying to the Exhibition of the Royal Academy, there to crowd round the pictures of the year. May ushers in the artists' harvest, when the fruits of their busy year are garnered; on May-day the Royal Academy opens its portals; and, in the present year, 1868, it is numbered among those centenarians for whom the "Quarterly" has been fighting a battle; for it has attained its one hundredth year. Painting and Music are sister arts, and May is the month for the nightingale, both in town and country—though in the concert-room or opera-house, the warbled notes of the nightingale, whether Swedish or Italian, are so far from being "unpremeditated," like to those of the real Philomela, that they are only produced through the medium of other notes of a pecuniary and banking value. And if the nightingale of the woods and groves sings

"jug-jug-jug-jug-teren," as Lilly, Queen Elizabeth's poet, says that she does, or merely "oree, osee," as Chaucer reported, or indulges in that twenty-four lines of distracted letters with which Bechstein endeavoured phonetically to represent her unapproachable melody, it is at least quite as intelligible as much that is heard from the lips of wingless singing bipeds. Milton has a sonnet to the nightingale, warbling at eve, with

"Liquid notes that close the eye of day,
While the jolly hours lead on propitious May;"

And Cowper, not only in his Address to the nightingale that he heard on New Year's day, but also in his lines "To Catharina," and in a passage in "The Task," showed that he considered the song of the bird as cheering, exhilarating, and most musical; but not "most melancholy," the epithet of Milton, which stirred the poetic indignation of Coleridge, and inspired him with his well-known "Ode to the Nightingale."

The nightingale takes us a-Maying into the country; and, although we live in an age that is too utilitarian and matter-of-fact to permit the careful cultivation and popular recognition of poetical and old-world customs, yet the observance of May-day is not altogether a thing of the past. In many sequestered nooks and corners of the land there are people to be found who lovingly cling to old customs, and to whom folk-lore is a living reality, and not a dead letter to be exhumed for the interest of a curious minority.

The Maypole! Washington Irving, in a delightful passage in the "Sketch Book," has recorded the fancies that were awakened by the mere sight of one at Chester, although it was nothing but a bare pole. And as for the phrase "going a-Maying," it sounds so pleasing, pretty, poetic, pastoral, and picturesque, that quite an alliterative crop of early May p's might be forced, as epithets wherewith to grace the banquet of delights that Nature so bountifully provides in "the merry month of May." For going a-Maying is suggestive of the sweet burst of bud and blossom; the tender mist of green that overspreads the woods; the forest carpet of primroses, violets, hyacinths, and anemones; the bright tassels of the birch and the opening fans of the chestnut leaves; the kine-dappled meadows, sprinkled with cowslips and gemmed with buttercups; the snowy bloom of the cherry, plum, and blackthorn; the kingcups and the golden broom, on first seeing which Linnæus fell upon his knees and thanked God for having created so glorious a sight; the cuckoo, telling "his name to all the hills;" the delicious trills of the nightingale, and the universal charm of songbirds. Of a multitude of things, in short, that are pleasant, and fragrant, and beautiful, does the phrase "going a-Maying" remind us; though not of the "May" itself, for the hawthorn does not bloom in time to grace the May-day festival. Going a-Maying has the ring of poetry in its very sound; and the memory that is stored with poetic passages in praise of May, can feast on some of the sweetest bits of our choicest poets. Chaucer, "the father of English poetry," makes great mention of the attractions of May; so that even to "the blissful place" he could assign no higher charm than by saying, "There green and lusty May shall e'er endure;" and, in "The Knight's Tale," we see Arcite and Theseus going a-Maying to the grove, and from thence procuring their hawthorn garlands. Then we have Herrick going a-Maying with his Corinna; and we listen to Spenser and Milton chanting their hymns of praise to "fair May," "flowery May," "beauteous May," "bounteous May," and, perchance, we try to emulate Archdeacon Wrangham in translating Buchanan's Latin Ode to May-day; and we hear Ben

Jonson's "Salutation to Maia;" and see Dryden's gentle Emilia, "more fresh than May herself," going forth

"Before the day,
To do th' observance due to sprightly May."

Then from Thomson, Wordsworth, and modern poets, we pass through the peasant Clare's too-much-neglected verse, to the laureate's "May Queen," who, although artists persist in depicting her as a little child, was evidently a grown-up young woman, not without vanity and a spice of flirtation, and who was expecting soon to be the wife of that Robin who was, doubtless, one of the many partners with whom she

"Danced about the Maypole and in the hazel copse,
Till Charles' Wain came out above the tall white chimney tops."

The description of the "Lady of the May," given by Browne, in his "Britannia's Pastorals," coincides with Strutt's account of going a-Maying, which was conducted in such a fashion that it very deservedly, in 1585, obtained reprobation in Stubbes' "Anatomie of Abuses;" and the palace-porter's man, in Shakespeare's "Henry VIII," complained that the blowing of the horns, and the tumult of the men and maidens as they went to the wood to break branches from the trees, made it impossible to sleep on May-day morning.

On the whole, we may congratulate ourselves that the sport of going a-Maying has fallen into the hands of village school children. We may have lost the "stage-plaies," of which Stowe tells us—the Robin Hood and Maid Marian, whose *morion*, or head-piece, together with her whole attire, was paid for by the parish, of which accounts are yet to be found in the ancient books of churchwardens. We may have lost her successor, Malkin or Mawkin, the clown dressed up in woman's clothes, who afterwards still further degenerated to the Jack-in-the-Green; but it does not require a great amount of stoicism to reconcile us to the loss. We may be quite content with reading in the pages of the Old Chronicle, Hall, of Henry VIII going a-Maying to Shooter's Hill, and of Queen Elizabeth doing the same at Sir Richard Buckley's, at Lewisham; but we may prefer to look upon that picture of our present sovereign as the Queen of that May-day ceremony of 1851. Nor need we grieve that we cannot see Chaucer's May-pole, that "great shaft of Cornhill" (from which the Church of Andrew Under-shaft took its name), whose last appearance was on "the Evil May-day" of 1517, when the tragedy of the "London Apprentices" cast a gloom over the May-day sports, from which they were many years in recovering; thirty-two years after which date, that tall shaft was cut up and burnt by the hearers of the curate of St. Katherine, Sir Stephen, who had denounced it as an idol; and as such was it destroyed on the Sunday afternoon, by Sir Stephen's hearers, "after they had well dined, to make themselves strong," as Stowe says, not without sarcasm. Its companion, that famous "tall May-pole" that once "o'erlook'd the Strand," and was celebrated by Beaumont and Fletcher, and by Pope, had a better fate; for although it had fallen in 1644, in obedience to law, it had been replaced in 1661, there to remain, though shattered, till 1717, when Newton removed it to Wanstead to support Huyon's great telescope. We can part with these May-poles, and we can walk through Brook Street, May-fair, without caring to see that brook and that field where was wont to be held the May-fair to which gossiping Pepys went in 1660—those fairs, "whose greatest crime was harmless, honest mirth," according to the cavalier's testimony. We have outlived these, as we have out-

lived the chimney-sweeps' May-day, of which Horace Smith and Charles Lamb have told us; and their predecessors, the milkmaids, with their "garland of polished plate," of which we have an account in "The Tatler." Enough for us are the village school-children with their May "garland;" and even they are only to be found here and there, and in certain counties; and in another generation their pretty and innocent custom may have become extinct. Let us glance at it before it leave us, first quoting some lines by the poet of "The Christian Year:"—

"Come, ye little revellers gay,
Learners in the school of May,
Bring me here the richest crown,
Wreathed this morn on breezy down,
Or in nook of copse-wood green,
Or by river's rushy screen,
Or in sunny meadows wide,
Gemmed with cowslips in their pride;
Or perchance, high prized o'er all,
From beneath the southern wall,
From the choicest garden-bed,
'Mid bright smiles of infants bred,
Each a lily of his own
Offering, or a rose half-blown.

"Bring me now a crown as gay,
Wreathed and woven yesterday.
Where are now those forms so fair?
Withered, drooping, wan, and bare,
Feeling nought of earth or sky,
Shower or dew, beheld they lie,
Vernal airs no more to know;
They are gone—and ye must go;
Go where all that ever bloomed,
In its hour must lie entombed.
They are gone; their light is o'er:
Ye must go; but ye once more
Hope, in joy, to be new born,
Lovelier than May's gleaming morn.

"Hearken, children of the May,
Now in your glad hour and gay,
Ye whom all good angels greet
With their treasures blithe and sweet:
None of all the wreaths ye prize,
But was nursed by weeping skies.
Keen March winds, soft April showers,
Braced the roots, embalmed the flowers.
So if e'er that second Spring
Her green robe o'er you shall fling,
Stern self-mastery, tearful prayer,
Must the way of bliss prepare,
How should else earth's flowerets prove
Meet for those pure crowns above?"

The children in the illustration on the next page* were drawn from life, last year, in Huntingdonshire, where "going a-Maying" after this fashion is very generally observed. Their "garland" was made in the traditional pyramidal shape, and was composed of cowslips, hyacinths, wood-anemones, orchids, crab-blossom, gilliflowers, periwinkles, primroses, laurestinus, and topped with the crown-imperial. Dolls were placed on the garland, the chief doll (though they knew it not) being the representative of the goddess Flora, in the festival of the Roman *floralia*. From the base of the garland, which was carried by means of a stick thrust through it, were hung ribbons and pieces of gay-coloured stuffs. The children took their garland to the houses of the various farmers and residents, and sang their May-day song—a curious medley, in which religion figures after the manner of the old times, and is introduced with the appearance of levity, yet so as quaintly to suggest how simple piety may be connected with the enjoyment of any

* An account of the parish, and a photograph of the church, will be found in "Historical and Architectural Notes of the Parish Churches in and around Peterborough." By the Rev. W. D. Sweeting. Illustrated with photographs by Mr. W. Ball, of Peterborough.

festival. The whole ballad is too characteristic to be lost. I took down the words, and found that they had been taught by mother to daughter, for three or four generations; and they were these:—

"Here comes us poor Mayers all,
And thus we do begin,
To lead our lives in righteousness,
For fear we should die in sin.
To die in sin is a dreadful thing,
To die in sin we mourn;
It would have been better for our poor souls
If we had never been born.
We have been rambling through the night,
And part of the next day;
And now we have returned back again,
We have brought you a branch of May.
A branch of May, it looks so gay,
Before your door does stand;
It's only a sprout, but it's well budded out
By the work of the Almighty hand.
Awake, awake, my pretty fair maids,
And take your May-bush in,
Or it will be gone before to-morrow morn,
And you'll say that we brought you none.
Awake, awake, my pretty fair maids,
Out of your drowsy dream,
And step into your dairies all,
And fetch us a cup of cream.
If it's only a cup of your sweet cream,
Or a mug of your brown beer;
If we should live to tarry in the town
We'll call another year.
Repent, repent, you wicked men,
Repent before you die;
There's no repentance to be had
When in the grave you lie.
The life of man it is but a span,
It flourishes like a flower;
To-day we are, to-morrow we're gone,
We're gone all in one hour.
Now take a Bible in your hand,
And read a chapter through;
And, when the day of judgment comes,
The Lord will think of you.
Good morrow, lords and ladies,
It is the first of May;
We hope you'll view the garland,
For it looks so very gay.
The nightingale she sings by night,
The cuckoo she sings by day;
So, fare-ye-well, we must be gone,
We wish you a happy May!"

Orton Waterville, Huntingdonshire, three miles south-west of Peterborough, a living in the gift of Pembroke College, Cambridge. The May garland in this village is got up with considerable care, and forms an item in the annual Church Missionary Report, the money collected in the "going a-Maying" being presented by the school-girls to the Church Missionary Society. Thus, in the £44 3s. 3d. sent to the Society from this parish, as its contribution for 1867, one item is "May Garland 10s. 1½d." Another item is "Sale of flowers £13 3s." This large sum was procured from the sale of garden and wild flowers, sold chiefly in penny bunches, made up every week with much artistic skill, and sold by ready and cheerful agents, the market-woman, the postman, the rector's daughter, etc. "The flowers," says the rector, the Rev. John Mills, in a communication published in "The Church Missionary Gleaner," for January, 1868, "The flowers are collected, not from one garden only, but from many, both in the villages and outside. And it is exceedingly pleasant to see the children coming in, in troops almost, in the merry spring time, with joyous faces bringing in their bunches of violets and primroses and orchises, collected in the fields and woods about. They each receive a little printed card, with a picture on it (a Missionary subject generally), which provides them with a fresh thought for that week, and these cards they usually put up in their cottage rooms. And who shall say what good and blessed results may come from this simple means of enlisting the sympathies of the young, and keeping up their interest in such a loving and loveable employment." Of the origin of the "May Garland," at Orton Waterville, Mr. Mills gave an account in "The Church Missionary Juvenile Instructor," for 1858, page 175. Perhaps this instance of the "May Garland" may be unique; it is certainly suggestive, and commends itself as worthy of imitation in some, at least, of those twelve thousand villages in which, as the Rev. J. C. Ryle tells us in "Work to be Done," the missionary cause is never pleaded or supported. Orton Waterville shows us how "going a-Maying" may be made pleasant, agreeable, and instructive to all concerned, and, at the same time, subservient to a good and great cause.

The church shown in the illustration is that of

IN THE PINE FOREST.

THE MORTONS OF MORTON HALL.

CHAPTER XXXI.—IN WHICH HENRY TALBOT IS STARTLED BY AN APPARITION IN THE DEPTHS OF THE FOREST.

DISREGARDING the advice of the backwoodsmen and fishermen of Milwaukee, who recommended him—as a stranger to forest travel—rather to choose the longer route, and to follow the windings of the Watertown River, Henry Talbot, confident in his own prowess, struck at once boldly into the forest, and soon found himself completely shut in from any view of the lake or the open country.

The forests of North America differ widely in appearance from the jungles of Asia or Africa, glowing with the gorgeous foliage of the tropics; or from the woods of Europe, often entangled with undergrowth and brambles, and variegated with the different-coloured foliage of deciduous trees.

In the western hemisphere, and particularly in the northern portion of that vast continent, the forest trees consist chiefly of larches, pines, cedars, and other, generally sombre, evergreens. The trees stand wide apart, tall and straight as the masts of a ship, the branches rarely at a less elevation than twenty feet from

the earth, and these shoot directly upwards. There is no obstruction whatever to impede the progress of the traveller, and men may easily walk four or five abreast, or horsemen may ride without difficulty through the long, regular aisles, which extend in every direction until the perspective apparently reduces them to a point in the far distance.

The soil is covered, to the depth of several inches, with a soft, yielding, springy substance, of the colour of tan, the *débris* of former trees which have died with age and rotted away, while others have grown in their place. Not a spot of verdure is to be seen; for the sun is shut out by the thickly interlaced branches high overhead, and the tan with which the soil is covered prevents the growth of grass or herbage.

The traveller seems to be walking over the softest of carpets, and not a footfall of man or beast is audible. There is no blithe twittering of birds, for the birds shun the forest depths; no busy hum of insects; no sound of living creature. The beasts of the forests hide themselves during the day, and generally prowl stealthily and silently throughout the night. It is only after nightfall that sometimes, though rarely, may be heard the low growl of the bear, the howling bark of the wolf, or the shrill, unearthly scream of some bird of night—sounds calculated to strike terror to the heart of the traveller.

In the depth of the forest, even at midday, a sombre gloom prevails, somewhat resembling the "dim, religious light" shed through the painted-glass windows of the chancel of a cathedral, while during the night everything is wrapped in utter Egyptian darkness. From day to day the traveller wanders on without the slightest change being perceptible to his eye, and without meeting with a living creature, and if he be provided for the journey, and have a pocket-compass to direct his course, he will, probably, in course of time, reach his destination in safety.

Woe, however, to the inexperienced traveller who enters the dark forest of the Far-west without compass or guide. Having been warned of the difficulties that he will meet with, and told what precautions to take when he first enters the forest, he laughs at the idea. Nothing seems more easy than to pursue a straight path through the long apparently interminable aisles of trees—nothing, in reality, is more difficult. He walks on for hours, and fancies that he has not swerved a yard from the straight path—that he has never quitted the alley he entered. He may lie down and rest for the night, and continue his journey the next day, and the next, and not discover his error until he begins to wonder when he shall reach his destination. He now begins to fear that he has strayed from his course, and watches the trees narrowly as he passes along, until at length he remarks some stain, some piece of torn bark, or some peculiar patch of moss on the trunk of one of the trees, and fancies that he has seen it before. Still he walks on, until, perhaps, before long, perhaps not for hours, he remarks it again, and then he discovers, to his consternation, that he has been travelling in a circle.

He tries again and again to keep his course, but with a similar result; he has no means of guiding himself but his eyes, and he finds that they are of no avail. Perchance, in course of time, he may emerge from the forest at a spot far distant from his destination, or he may fall in with some backwoodsman, or hunter, or more experienced traveller; but it is as likely that he will wander on unavailingly, until he faints with hunger and fatigue, and lies down to die. Years after, some redman or hunter may come across his bleached bones beneath the trees.

The Indians, and backwoodsmen, however, find their way with the utmost facility, by means of marks and signs familiar to themselves, though unintelligible and often imperceptible to strangers, to whom, even with the aid of a pocket-compass, forest travel is extremely difficult, since they must stand to set the compass after every few yards of progress, to save themselves from going astray.

Henry Talbot smiled to himself at the notion entertained by the settlers whom he had just quitted, that he would find himself at fault in the forest.

"What can be more simple," he murmured, as he gazed admiringly down the long alleys formed by the trees, stretching away to a distant point in every direction—"what can be more simple than to keep straight on through one of these alleys, if a fellow be careful in the first instance to select the right one? Let me think. A bee-line, due west. That was the direction. I am all right; and a walk of twenty miles over this soft turf is a precious sight easier task than many a day's journey that I have performed of late. Shaded from the sun; no streams to ford; no hills to climb! Why, I ought to reach Watertown with ease in six hours at the utmost."

Thus satisfied in his own mind, he stepped briskly forward, charmed with the impressive novelty of the scene.

Completely shut in by trees, the many cheerful sounds, which in the early summer morning had made music in the air, became suddenly inaudible. The sudden lapse into silence was almost awe-inspiring. He could not hear his own footfall, nor could he see his own shadow on the springy turf. He felt as if he were the spirit of that vast silent solitude. It was a grand sight to gaze through the long alleys of trees, seemingly planted by rule and compass, so regular was the space between each trunk. It was a grand sight to look upwards at the leafy canopy which shut out the sky from view. The atmosphere he breathed was heavy with the perfume of the pines and cedars; and, scarcely heeding whither he went, yet fancying that he kept the same straight path, he wandered on, taking no thought of time or distance, until a slight sensation of hunger and fatigue warned him that it must be time to partake of his midday meal.

The watch he had brought from England had become the spoil of the pirates in the Gulf of Mexico; but he had purchased a cheap watch at St. Louis, and on consulting it he discovered that it was already past noon-day, and that he had been five hours in the forest.

"I must have walked at least eighteen miles," he thought to himself; "and I ought to be nearly through the forest. They told me the clearing extended two miles from the settlement, and I should by this time be getting a glimpse of the outer world again. It's all very pleasant for a while; but a fellow gets wearied with the sameness, and I shall be glad to see the blue sky once more, instead of this dark-green roof of branches."

He seated himself and ate his dinner, and rested an hour, and then again set forth on his journey, expecting every moment to see the bright daylight beaming in through the trees ahead.

Another hour passed away, and again consulting his watch, he thought—

"I must have walked slower than I fancied I was walking, or else those fellows at the settlement count Irish miles instead of English ones!"

When, however, another hour had slipped away, without the appearance of any sign to indicate that he was near the edge of the forest, he began to be alarmed, and to suspect that he had really missed his way.

"Three o'clock!" he exclaimed. "If I go on thus it will be dark before I escape from the forest. Can it be possible that I have swerved from the path? I don't think it; and yet I ought to have reached the clearing ere now."

Still he walked, wondering if it were really possible, if a traveller walked steadily on, that he could by any chance swerve from the alley of trees through which he was walking.

It seemed to him quite impossible; and, attributing his delay in getting clear of the forest to a wrong estimate of the distance on the part of the people who had directed him, he increased his pace, fearful lest darkness should overtake him. He had remarked that the afternoon had become rapidly more and more gloomy; and though he knew that it would be daylight for several hours to come in the "open," he knew not how soon the forest might become wrapped in the dark mantle of night.

"A nice treat it would be to camp down in the forest all night!" he thought to himself; "though I have camped in worse quarters. But then I expected to camp out. Now I hoped—What's that?" he suddenly cried aloud.

This exclamation was caused by the appearance of some object which glittered in the dim light, at the foot of a tree a few yards in advance; and on reaching the spot he discovered, to his chagrin and consternation, that the gleam of light came from a bottle—the very bottle that he had brought with him from the settlement that morning, and which had contained the water that he had drunk at his noonday meal. He had thrown the bottle away because it was cumbersome to carry, and now he examined it narrowly, before he could really believe the fact. There was, however, no mistake, and a further search over the turf disclosed other evidences that after a rapid walk of nearly three hours—as he thought straight ahead—he had returned to the spot where he had dined.

"Well, this is pleasant, certainly!" he ironically muttered aloud. "Delightful! I suppose I have been playing this game all day, running round in a circle, like a fellow at a circus. I wonder now whereabouts I really am? whether I'm nearer the lake than Watertown, or whether I've gone astray in a wrong direction altogether. I wish I'd taken the advice of people wiser than myself, now that it is too late; though, how I can possibly have gone astray I cannot imagine. Perhaps," he went on, half vexed, half amused at the dilemma in which he found himself, "the fairies and wood nymphs, whom the march of progress has driven from Europe, have found refuge in the New World, where they still play their tricks upon travellers. I can account for it in no other way."

He considered for awhile what was best to be done. He had already walked a great distance—thirty miles at least, according to his own estimate—and was both hungry and weary.

By pressing on he might only wander still farther out of his path, or else return again to the same spot. In another hour or two the forest would become perfectly dark, and he would be compelled to camp down.* Under the circumstances, he thought it quite as well to camp down at once, before he made himself still more

hungry and weary to no purpose; for he had not a particle of food remaining in his wallet, wherewith to satisfy his appetite. He therefore unstrapped his cloak from his shoulders, wrapped it closely round, and lay down, with his knapsack for a pillow, at the foot of the tree beneath which he had dined three or four hours earlier, and, thinking moodily over the continuous succession of mishaps—serious and trivial—which he had suffered since he had left his home, he fell asleep.

He must have slept a full hour, when he woke suddenly, fancying that he heard a human voice at no great distance. He sat up and listened; but as all was still, he supposed himself to have been dreaming, and was about again to compose himself to sleep, when he heard a sound as of leaves scattered in the wind, and presently a youthful and musical female voice was heard to say—

"'Tis of no use, Peppercorn. You *shall* not have your own way. Ah! but you are rightly named, you little vixen. You thought to crush me against that tree; but I'll teach you that I am your mistress. There now—So-o-o. Be a good lass, and we'll go home. In a day or two we'll be the best friends in the world—"

The voice was still speaking, when—treading silently over the yielding turf—a pony appeared from an adjacent alley of the forest, and, seated on a side-saddle on the animal's back, was the speaker, apparently quite a young woman, dressed in a riding-habit and hat and feathers.

The lady's costume, as far as Henry Talbot could discern amid the fast gathering gloom, would not have discredited a lady-equestrian either in London or New York, and, in his astonishment at the unexpected sight, the young man pinched himself to make sure that he was really awake; and even when he had satisfied himself that such was the case, but that he had heard the voice he would have fancied that he beheld an apparition, so unlooked for, in such a spot, was the appearance of the youthful stranger, and so stealthily and silently the horse and its rider seemed to glide towards the spot where he sat.

Suddenly, however, the lady drew the reins, and in a voice in which surprise and some little alarm were intermingled, exclaimed—

"What is that? Who is there?"

"A traveller, madam—an Englishman," replied Henry, springing to his feet and doffing his hat. "I have unfortunately lost my way in the forest."

The young lady appeared to be re-assured by the tone of the young man's voice; but his sudden movement had caused the pony to shy violently.

"Take care, sir, pray take care," she cried. "You frighten my pony. Steady—steady, Peppercorn." Then again to Henry—

"You say, sir, that you are a traveller and an Englishman. Pray may I inquire what has brought you here, away in the backwoods, where we see few strangers, and far from any route that an ordinary traveller would be likely to take?"

"I have come lately from St. Louis," explained Henry. "I left Milwaukie settlement this morning for Watertown, where I wish to see one Mr. Morton."

"To see Mr. Morton!" exclaimed the lady. "Well, sir, you are not very far from Watertown, and Mr. Morton resides there. The question is, though, how you are to find your way there through the forest tonight. If you have lost your way in the daylight, you are not likely to find the path in the darkness, which will soon come on. You must not remain here, at all events, unless you wish to be seized with ague before morning."

* The phrase to "camp down," or "camp out," is applied in the backwoods of America and Canada to sleeping on the bare earth, beneath the canopy of heaven, as well as to resting in a tent or camp. Travelling in a circle is explained by the instinctive tendency to face the light. In the Australian bush many a life has been lost by following the sun. Occasional glimpses of light even in the forest would fatally mislead.

"Pray, madam, what may be the distance from here to Watertown?" inquired Henry.

"Oh not far. About four miles. If you keep that alley to the left (pointing with her whip) until you come to a cedar, mossgrown to full three feet from the ground, and then turn off at a right angle till you come to a pine which has been scathed by lightning—a pine, mind, because you'll come across *three* scathed cedars before you reach the pine; and then—But it will be perfectly dark before that, and you Englishmen are so sure to go wrong when you attempt to thread the forest. I really don't know——"

"I am afraid, madam," replied Henry, smiling at the idea of his following such a direction, "that I should stand a poor chance of getting clear of the forest to-night, if it be left to me to judge between scathed pines and cedars."

"Well, I'm something of the same opinion myself," returned the lady, smiling in her turn. "But don't, pray, address me as madam. Say Miss Morton, or never mind any title. Mr. Morton is my brother. I'll tell you what will be the best plan, young gentleman. Just remain where you are. Don't stir an inch, and I'll hasten home and tell my brother Henry to send one of the hired men, with a led horse. You may thus perhaps yet reach Watertown before the storm comes on. There's a violent storm brewing, but it won't come on until after sunset. Now don't stir from that spot if you value your health—perhaps your life. By the way, sir, I have not inquired your name."

"Henry Talbot is my name," replied the young man.

"Henry Talbot!" exclaimed the young lady, with a start of surprise. "That's strange indeed!" she went on to herself. Then she added—

"Pray don't stir, Mr. Talbot, and in another hour you'll be safe at Watertown. I'm glad I fell in with you;" and, lightly touching her pony with the whip, she darted away at a gallop, and was almost immediately lost to sight in the gathering gloom, leaving Henry still half doubtful whether he was not under the influence of a vivid dream.

CHAPTER XXXII.—IN WHICH HENRY TALBOT FINDS HIS WAY OUT OF THE FOREST, AND ARRIVES SAFELY AT WATERTOWN.

"A STRANGE adventure!" thought Henry Talbot, after the fair apparition had departed. "I could not clearly see her features, but I fancy she is pretty. At all events, she has a pleasant voice. But what a strange way she has with her. Except a little tremor in her voice at first, she did not appear to be at all frightened, while most young women in her position would either have fainted with terror, or have galloped away at full speed."

Thinking over this latest adventure, and wondering what sort of a place Watertown would prove to be, he sat still beneath the tree, or only rose to pace a few steps to and fro, fearful that if he once were to lose sight of the spot he might not be able to find it again, and might, in that case, be compelled to remain all night in the forest. He waited, as he fancied, much more than an hour, and yet there were no signs of the approach of the promised guide. He listened attentively; but not a sound was audible save a low moaning in the air, and a whispering noise among the branches of the trees, foreboding the coming storm.

"Can she have played me false?" he asked himself, "or am I deceiving *myself*, and has all that has passed been mere imagination? am I dreaming still?"

The darkness had closed in so rapidly that he could not, without great difficulty, make out the figures on the

dial of his watch. At length, however, he discovered that it wanted a few minutes to five o'clock, and that little more than three quarters of an hour had elapsed since his fair visitant had disappeared.

"I could have declared that two hours had passed away since she left me," he said aloud, as he replaced the watch in his pocket; and the words had scarcely escaped his lips when a slight rustling of the turf caught his attention, and, turning his head, he saw two huge, dim, shadowy objects approaching towards him from the alley in which the young lady had disappeared.

"He hoy!" presently shouted a voice, to which he replied with an "Hilloo!"

"Oh ye're thar, air yer, mister?" was the reply; and the next moment the two shadowy objects stood still before him, and he perceived a man seated on horseback, with a led horse beside him.

"Best meount tew onest, stranger," cried the man. "Thar bean't no time tew lose, I kin tell *yew*. We'll hev it comin' deown young b'ars and catameounts, claws downmost, afore we get tew hum tew Waterteown."

Henry mounted without a word.

"Got no 'plunder,' I s'pose?" asked the guide.

"Only my knapsack and cloak," answered the young Englishman.

"That's well; hitch'em on tew the saddle. Some folk can't travel 'thout a hull pile o' plunder. I never carr's more'n a shirt-collar and a baccy-box myself. Now hold on like greim death, stranger, and follow me."

With this the guide cantered off at full speed, followed by Henry, who, in less than ten minutes, found himself clear of the forest.

Although the sky was lowering and gloomy in the "open," and the evening twilight was beginning to set in, the light was for a few moments dazzling to the young man's eyes, so long accustomed to the gloom of the forest. In a little time, however, he was able to look at the country over which he was riding.

As soon as he was clear of the forest, the guide somewhat slackened his speed, and allowed his companion to ride abreast with him, and Henry again inquired the distance to Watertown.

"I reckon heow ye're in Waterteown, neow, friend," was the reply. "But if yer mean the *Place*, why it's 'bout tew mile ahead. Ye'll see the houses sune's we git atop o' yon meounting. The forr'st used fur tew reach tew thar."

The "meounting" was simply a slight elevation—a mere rise in the road; but all elevations, from a mere hillock to the loftiest peak of the Alleghanies, are called mountains in the Far-west; and that the forest, at no very distant date, had extended to the rising-ground, was sufficiently manifest by the presence of thousands of charred and blackened stumps—that most dismal and unsightly blemish to the American landscape—which rose up in every direction, imparting to the surrounding country the appearance—to a stranger's eye—of a vast, long disused burying-ground, in which the tombstones had been left to blacken and decay uncared for.* Between these stumps, corn and grain, and various descriptions of produce, were sprouting from the soil; but the absence of hedges, or indeed, except here

* Whenever the forest is levelled to prepare the land for tillage, the stumps of the trees are burnt, and then left to decay with the roots in the ground. There are machines for tearing these roots and stumps from the soil; but the expense and difficulty of removing them are so great, that the machines are seldom used, especially as the idea prevails that their gradual decay improves the soil. The stumps occupy several years in decaying, and are to be seen almost everywhere except in the very eldest settled states, though they are most numerous in the West.

and there, of any division of the fields, rendered the landscape dreary and desolate.

Soon large drops of rain began to fall at intervals, and the sky grew darker and darker, and again the "hired man" urged his horse more rapidly onward, and his companion was not slow to follow his example.

At length they reached the summit of the hill, and Henry saw before him, about half a mile distant, a large, straggling dwelling-house, enclosed in rather extensive grounds, which his companion informed him was "the Place." This dwelling was surrounded by a dozen or more log-cabins, and by barns, out-houses, and store-houses innumerable. The cabins all had small gardens attached to them, and the surrounding fields appeared to be in a high state of cultivation; large grazing grounds, a short distance beyond them, were well stocked with cattle and sheep, and hedges alone were wanting to give to the place the appearance of a very extensive English farm.

A few minutes' canter brought them to the gate of the "Place," where a tall, sunbrowned, athletic young man, attired in woodman's costume, yet having the appearance of a gentleman, was waiting to receive them.

"You, sir, are, I presume, the traveller of whom my sister has spoken?" he said, courteously addressing Henry. "Please to dismount, and I will lead you in doors. You are no doubt tired."

"Isaac," to the hired man, "take the horses round to the stables, and be sure that everything is well secured before the shower comes on."

Then, again addressing himself to his guest, he said, "It was fortunate that my sister fell in with you, sir. We are going to have a storm, and our western storms are very violent. You would have found the forest but a poor shelter."

As they drew near the house, Henry, blushing and hesitatingly, spoke of his attire as being unfit for respectable society.

"Pooh, pooh!" exclaimed the young man, Henry Morton, "it would be strange if it were otherwise than it is, if, as my sister has informed me, you have travelled from St. Louis. The woods and prairies are not beautifiers of apparel. You must do as we all do out in the Far-west when travelling—accept the assistance of your host. I dare say *my* wardrobe will supply you with something that will fit you, and you must make free with it for the present."

The young Englishman was about to expostulate, when he was interrupted by his host.

"Nonsense!" he said; "it would never do out here, to adhere to the conventionalities of life as in the old settlements. We are too glad to welcome a stranger, to hesitate to put all we have at his temporary disposal. By the way, you know my name. Yours, my sister tells me, is Talbot, Henry Talbot."

Henry bowed assent.

"We are namesakes, then, in one sense. And you are an Englishman?"

"Yes, I am an Englishman," answered Henry.

"It is strange," continued the young squire; "my father, who is an Englishman by birth, and who has been for some time absent in England, wrote me some months ago that it was probable that we should be visited by a young friend of his who bore your name. Poor fellow! we looked for him for some time with considerable anxiety; but he will never come to us now."

"From what part of England was he expected?" inquired Henry.

"My father wrote from St. David, in Cornwall, where he met with this young man, who was on a visit to his sister," was the reply.

"Then, in that case, Mr. Morton," said Henry, "I am he whom you expected."

"Sir!" exclaimed the young squire, stopping short as he was about to enter the house, while a look of stern doubt and suspicion came over his features. "The young man of whom my father wrote perished at sea, in the Gulf of Mexico. My father subsequently wrote to that effect. Indeed, his letter only came by the last British mail packet; and, moreover, I have read the newspapers, which gave a full account of the loss of the Amazon, with all on board, except two small boat-loads of passengers and sailors, who landed in Cuba. Henry Talbot was in neither of those boats."

Henry felt that he was suspected to be an impostor, who had assumed the name of Talbot in order to impose upon strangers, and for a moment his face flushed with shame and indignation. He knew not how to explain away the suspicion, and he felt that anything except a satisfactory explanation would only serve to increase mistrust. At length he recollected that he had a letter from the British Consul at New Orleans in his pocket, as well as the letter given to him by the merchant of St. Louis, and, drawing these letters forth, he handed them to young Morton, saying—

"I think, sir, you will be satisfied when you have read the contents of those letters, that Henry Talbot *did* escape with his life, though with little besides, and that I am he."

The young man read the letters, and Henry then narrated all the details of the seizure of the Amazon by pirates, the subsequent sinking of the ship, the escape in boats of the passengers and crew, and the arrival of the pinnace at St. Domingo, together with his subsequent adventures in America; and this story, together with his replies to several questions put by young Morton relative to his father, convinced him that his guest spoke the truth.

"Pray excuse me for a momentary doubt and suspicion," he said, seizing Henry's hand. "I am sure now that you are the young gentleman of whom my father wrote, and I sincerely congratulate you upon your escape, and bid you welcome to my father's house. My sister will be rejoiced to hear what you have told me. But it is strange that my father has not heard of your escape."

"I suspect," replied Henry, "that the fault rests with me. I knew my sister believed me to have perished, and I would not write to her while I was in a state of destitution. By assuring her of my existence I should only have filled her mind with fresh anxiety."

"There I think you are wrong," said the young squire. "But we will talk over all these matters by-and-by. We shall have lots of questions to ask you about my father, who seemed to have been much attached to you, and wrote of you in high terms of praise, I assure you."

In spite of his expostulations, Henry was forced by his youthful host to proceed at once to the parlour, where Miss Morton was awaiting her brother.

"My sister will excuse everything," he said. "You will have plenty of time to smarten yourself up by-and-by. You must be formally introduced at once, or I shall get a scolding from her. What matters your appearance? She saw you in the forest, and you look like what you are—a traveller off a long journey through the wilderness."

Passing along a passage into which rooms opened on

either side, they came at length to a door at the far end, which opened into an apartment handsomely furnished with mirrors, pictures, sofas, lounges, and all the appliances and adornments of modern comfort and luxury. On one side of the room was a row of bookshelves, well filled with books, and on the opposite side stood a pianoforte and music-stool.

Near one of the windows, at the far end, a young lady, elegantly attired, was seated with a book in her hand. She rose at the opening of the door, and, perceiving her brother, came towards him; and, as she drew near, Henry recognised in her the fair equestrian to whom he was indebted for his release from the forest.

"Now what do you think, Mary?" the young man exclaimed, "You told me you were surprised when you first heard Mr. Talbot mention his name. You will be more surprised when I inform you that this gentleman is really our father's friend, whom we so long expected, and whom we believed to have perished at sea."

THE WORKSHOP REGULATION ACT.

THE Act of Parliament which bears the above title, and which is gradually coming into operation, has been called the Magna Charta of English childhood—a high-sounding designation, but not an inappropriate one when we realise the fact that by its various clauses it takes the working child and the growing lads and lasses of the factory and the workshop from under the arbitrary jurisdiction of the employer, and subjects them instead to the regulation of just, humane, and considerate laws. Let us glance briefly at the new regulations, and at some of the effects they are likely to produce.

Premising that the Act* is applicable to factories in the widest sense of the term—that is, to industrial establishments of all kinds where many hands are employed—the first thing that strikes us is the prohibition which excludes children under eight years of age from being employed at all—a clause which will deliver thousands of children from a bondage to which they ought never to have been subjected. A second regulation forbids the employment of any child on Sunday; a third limits the working hours of all children under thirteen years of age to six and a half hours a day; and a fourth compels the attendance of such working children at school for three hours daily, on five days in the week. Thus, where children are constantly employed, two sets of them have to be engaged, one set working in the fore part of the day, while the others are at school, and the other set working in the afternoon, while the morning workers are at school; though this regulation is subject to certain modifications—not at all damaging ones—made to suit the convenience of employers, under the sanction of the inspector of factories.

The parent is required to see that his child attends the daily school; and the employer is bound to ascertain every Monday morning that the child has so attended during the previous week—the school certificate book, filled up by the schoolmaster, being evidence of such attendance on the part of the child. The employer cannot set the child to work without such certificate, and it is therefore his interest to see that the child's attendance is regular; still, no responsibility attaches to the employer for any neglect on the part of the child—all such responsibility being very properly cast on the

parent. But here there is a difficulty sufficiently obvious: if a number of children absent themselves from school during one week, or any portion of a week, and cannot be employed during the following week on that account, two evils are the result—the master loses their labour, and his manufacture, it may be, stands still, and the idle children are remitted to further idleness. With a view to obviate this difficulty, Mr. Redgrave, the inspector of factories, proposes a remedy of a simple and practical kind, which, as it punishes the only real offender—the neglectful parent—cannot be too strongly recommended. The plan is merely an arrangement made with the schoolmaster, that he should, whenever a child does not appear in school at the appointed hour, send on the same day the name of the child to the manager or overlooker. If the child ought to have attended school in the morning, by sending the name to the manager he is enabled at once to prevent the child from working that afternoon, and to require the child to go to school instead; the child will thus make up the proper number of school attendances during the week, the parent will forfeit the *day's* wages—an immediate penalty of a moderate amount—and the employer will lose only one day's labour instead of five. If the child miss school in the afternoon, the same process is gone through, the manager forbidding the child to work the next morning, and requiring it to attend school instead. This is not a new arrangement: it has been in operation in many factories for years; and wherever this plan has been adopted it has succeeded in lessening the absences from schools. Although it requires prompt attention at first, yet the punishment follows so rapidly after the discovery of the neglect, that in a surprisingly short space of time children who have been truants, careless, irregular in their hours of attendance, and who have been in the habit of performing domestic duties at home instead of attending school, are transformed into regular and attentive frequenters of school, without the institution of legal proceedings against employers, who are less to blame in the matter than the parents, over whom they have no control, or against parents who err from their inability to appreciate the humane intentions of the Legislature. It appears at first to be a troublesome arrangement; but when it has been firmly carried out, and the children know that non-attendance at school will not be overlooked, and that they will certainly lose a day's wages, they give comparatively little trouble, and attend school as regularly as could be wished; in fact, the attendance of half-timers in many schools is punctual and constant, being frequently better than the attendance of the other scholars who are not under the restrictions of the Factory Acts.

Thus much at present as to the children between eight and thirteen years. Let us turn now to the "young persons," by whom the reader will understand persons of both sexes between thirteen and eighteen years. The Act provides that no female shall be employed on the Sunday, or shall work at any time in any part of any factory, where the melting or annealing of glass is carried on; and that no young person, and no woman, shall be employed either before six in the morning or after six in the evening, or on Saturday after two in the afternoon, with certain reservations.

The effect of these regulations, in connection with those fixing the meal-times, is, that the ordinary hours of work are sixty in a week, namely, ten and a half hours on each of the first five days, and seven and a half on the Saturday. In the winter months, that is, from the first of October to the first of April, the hours of work

* Three separate Acts came into force on January 1st, "The Agricultural Gang Act," referred to at page 165, "The Factory Regulation Extension Act," and "The Workshop Regulation Act."

may be taken from between seven in the morning and seven in the evening, instead of between six and six; but no work can be done later than two in the afternoon on Saturday; though, in order that seven and a half hours may be obtained on the Saturday, the work may begin at six in the morning. One month's notice must be given to the inspector previous to any alteration of the hours of work for the months of winter.

With regard to meals, the Act decrees that one hour and a half must be allowed for meals to all children, young persons, and women, between half-past seven in the morning and six in the evening—one hour being given before three o'clock, and at least half an hour before one o'clock. The time allowed for meals, and the hours at which they are to be taken, are to be stated in the notice hung up in the works. Other conditions with regard to meals provide that they shall not be taken in the same rooms where unhealthy processes are carried on, or where there is not a wholesome provision for ventilation. For the convenience of the employer, or for that of the workers, it is allowed to lessen the time set apart for breakfast or dinner, and to make up to the worker for it by ceasing at an earlier hour in the evening—a practice which has prevailed for years, both in factories and in workshops not subjected to inspection, and has been found to work well.

The question of holidays is not left to be determined solely by the demands of business, or the disposition of employers. No child, young person, or woman is allowed by the Act to do any work on Christmas Day or Good Friday; and, in addition to these customary holidays, eight half-holidays must be given in the year, four of them at least in the summer months, a whole day's holiday being reckoned as two half-holidays.

Special sanitary regulations are enforced for the ventilation of work-rooms, and to prevent their overcrowding, as is also the use of mechanical means for obviating or abating the peril to life and limb attending certain dangerous processes of manufacture. Stringent rules are also laid down enforcing the boxing-off, or fencing of machinery, so as to secure to the workers the utmost possible immunity from danger.

Such, briefly stated, are the principal measures provided by the new Act. It must be evident that to bring them all into force at once, without warning or time for preparation, would only tend to confusion, loss, and hindrance of business. Certain temporary exceptions have therefore been allowed, the effect of which is to delay, unavoidably, the full operation of the Act for a period varying from six months to two years; but such exceptions are of comparatively small import, and it is probable will cease to be practically operative before the expiry of the date the law assigns to them. Again; as many of the regulations above quoted, would, if carried out to the letter, be altogether mischievous in certain branches of modern industry, it has been found necessary to modify the application of them to such departments of manufacture. Thus, in letter-press printing, in the manufacture of glass, in the making of paper, and in various other industries in which men work to catch time, or have to attend on processes which cannot be safely intermitted, it would be impossible to insure that regularity and periodicity which are the normal result of ordinary labour, if the new regulations were strictly adhered to. Modifications of the new rules are therefore made in favour of such trades, and it is in the discretion of the Secretary of State to extend such modified rules to any particular class of industry, should such extension be required by the exigency of trade. It must be understood, however, that these modifications are in no way

oppressive to the workers; they do not increase the number of the working hours per week, but only economise the hours by distributing them in such a manner as to secure the efficiency of the work done.

While we can but congratulate the child worker on the protection this Act awards, and on the education it provides for him, one awkward reflection presents itself. The Act does not apply—cannot apply—to children who work at home under their parents' roof. There are tens of thousands of such children in London and the provinces. In London numbers work at home at lucifer-box making, lozenge-box making, the making of card-boxes of various kinds, baby-shoe making, carpet-bag and carpet-slipper making, artificial-flower making, etc.; etc. The earnings of all such children are small, often not more than twopence or threepence a day; but where the family is large and the parents poor, they are regarded as indispensable. Now it is to be feared that the child who is shut out of the workshop until he has completed his eighth year will be very little benefited if his work is only transferred to his home, which there is too much reason to fear will be the case. Work at home has no limit as to age, and would seem to have hardly any as to time. It is a fact that in the straw-plaiting districts infants of three to four years are found at work splitting and even plaiting the straw; and in some of the miserable villages of the Black Country one comes upon whole families working at the forge—six or eight of them at one fire—making nails, a task at which boys and girls of five or six are often efficiently skilled, and at which we have found them working up to near ten at night. In many of the handicrafts of Birmingham, again, children far younger than eight are, or used to be, employed in the simpler and easier departments of the work. The question is, whether the closing of the factory and workshop against the very young may not be an injury instead of a benefit to them, unless the law step in also to forbid or to limit the home work and to enforce attendance at school instead. It would be a miserable thing if the new Act were allowed to be defeated by those who make their profits by children's labour; if the work which young children are forbidden to do in the factory be exchanged for work of the same or a different kind which may be done at home.

One of the results of the limitation by law of child labour is likely to be an advance in the price of such manufactures as children take part in producing, and this result is to be expected as soon as ever the operation of the Act begins to be felt by employers. It is not that they will pay more money in wages in proportion to the work done (though it is likely enough that they will have to do that), but rather that in many cases they will get but half a day's work on the same area, and out of the same plant, which have heretofore furnished a whole day's work, and thus their cost of production will be enhanced. This consideration points to another possible result, by no means to be deplored, according to our notion, and that is, the gradual diminution and final abolition in some trades of child labour altogether. For it may well be that the expense and the trouble of superintending two sets of child-workers in one day may render it more profitable, or as profitable and less troublesome, to substitute adult labour in lieu of that of the child. To some extent this is likely to take place at once, but it will hardly be practicable in those branches of industry which are carried on upon an extensive scale, and where the margin of profit is so very small that any increase in wages must swallow up the employer's gains. What may have to be guarded against with reference to such cases and other analogous ones, is the

creation by new circumstances of a new class of middlemen employers, who shall undertake specified descriptions of labour performable by young children, and distribute it broadcast among the poorer families of our larger manufacturing districts. Such a system would effectually defeat the "humane intentions of the Legislature," if it became at all general—in which case we should have a race of industrial baby-farmers comparable to the old rural gang-masters whose exploits aroused such general indignation a short time ago. We will hope, however, that any such evil consummation will be sufficiently guarded against, even if it be not speedily rendered impossible by the forthcoming laws, which are to provide a suitable education for every poor man's child, and which will of course prevent his working while he ought to be learning.

THE MIDNIGHT SKY AT LONDON. MAY.

BY EDWIN DUNKIN, F.R.A.S., ROYAL OBSERVATORY.

If we refer to our diagram representing the sky south of the zenith for midnight in the middle of May, we shall discover that it is enriched by several of the most celebrated stars of the first magnitude, visible above the horizon of London, as Vega, Arcturus, Altair, Antares, and Spica. In addition to these, the planet Saturn is a conspicuous object in Scorpio, and easily distinguished from the bright stars near it, by the absence of any scintillation, or twinkling. Saturn, for the reasons given in January, is not inserted in the south view, but its position can be seen in the corresponding index map. Many new constellations have appeared in the east and south-east since last month, while the general advance of all the stars from east to west is clearly marked by the altered positions of the brightest objects.

Taking, then, the lower diagram first, the attention of the observer is directed to the zenith, which is now occupied by the constellation Hercules. It is the first time this year that Hercules is wholly contained in the southern half of the sky at midnight. There are one or two stars of the second magnitude, and several of the third in this constellation, some of which are near the zenith, east of the meridian line. Hercules extends over a large portion of this region of the heavens. West of Hercules, and on the meridian, the semicircular group of stars forming the Northern Crown is very conspicuous, its brightest jewel being Alphecca, or Gemma, in the centre. Directly below Corona Borealis is Serpens, with several stars of the second and third magnitudes; and, lower still, very near the horizon, is Scorpio, with its principal star Antares, and several others tolerably bright. Some degrees above Antares Saturn will be recognised. Looking due east, the brilliant Vega attracts our notice, about thirty degrees from the zenith. This star has passed since April 15th, from the northern half of the sky to the southern. Near Vega there are several stars in Lyra of the third magnitude. Below Lyra is Beta Cygni, or Albiero, a double star celebrated for the number of observations made on the colours of its two components. Between Albiero and the eastern horizon are several small constellations, the principal being Vulpecula, Sagitta, Delphinus, and Equuleus, the horizon itself being occupied by the sign Aquarius. In the E.S.E. the constellation Aquila can be distinguished by its group of three stars, the central one being Altair, of the first magnitude. In the diagram, Altair is in-

serted near the eastern limit; it is, however, about thirty degrees above the horizon. The horizon in the south-east and south is occupied, beginning from Aquarius in the east, by Capricornus, Sagittarius, Scorpio, Lupus, and Centaurus. If we now turn to the west and south-west sky, we shall have little difficulty in identifying most of the constellations and stars, with which some of our readers are probably by this time acquainted. These are Boötes, Coma Berenices, Virgo, Libra, and a few others. Looking due west, Cor Caroli is situated nearly

INDEX-MAP, LOOKING NORTH, MAY 15.

half-way between the zenith and horizon, surrounded always by stars of comparatively small magnitude. The first star of importance from the zenith towards the south-west is Beta Boötis, between which and Arcturus are several bright objects; Arcturus itself being recognised by its ruddy appearance. Farther down in the same direction Spica can be seen. At this time a line drawn from the zenith through Arcturus passes through Spica. Near the south-west horizon, west of Spica, the stars in Corvus are still to be distinguished. Between Cor Caroli and the horizon all the principal stars in Leo can be identified, Regulus being very near to the horizon. This star is not included in the diagram, which contains only a few stars in the most easterly part of this constellation. The horizon from west to south contains parts of Sextans, Hydra, Crater, and Corvus.

INDEX-MAP, LOOKING SOUTH, MAY 15.

The complete list of constellations which adorn the southern half of the midnight sky of May is composed of Hercules, Corona Borealis, Boötes, Coma Berenices, Virgo, Libra, Serpens, Ophiuchus, Aquila, Sagitta, Del-

phinus, Equuleus, Vulpecula, and parts of Sextans, Crater, Corvus, Hydra, Centaurus, Lupus, Scorpio, Sagittarius, Capricornus, Aquarius, Cygnus, Lyra, Leo, and Canes Venatici.

Boötes is one of the principal constellations of the summer evening sky. It is bounded on the east by Corona Borealis and Serpens, on the south by Virgo, on the west by Canes Venatici and Coma Berenices, and on the north by Draco. In the ancient catalogue of Ptolemy, twenty-three stars were included as belonging to this constellation; in the "Historia Celestis" of Flamsteed observations of fifty-four have been recorded; while, in the more modern celestial Atlas of Bode, 319 are inserted. Many of those observed by Bode are, however, invisible to the naked eye. Arcturus, one of the most brilliant stars in the northern hemisphere, is situated between the legs of Boötes. In ancient times it was a noted star among mariners, who, however, looked upon its influences with suspicion. The squally weather which generally preceded the autumnal season was ascribed by the Greeks to the power of Arcturus. It is related by Demosthenes "that a sum of money was lent at Athens on a vessel going to the Crimea and back, at the rate of 22½ per cent., with the understanding that unless the ship returned before the rising of Arcturus, 30 per cent. was to be paid."

Arcturus was the first star observed with a telescope in daylight. This feat was announced in 1635 by a M. Morin. It appears, however, that little notice was taken of the occurrence till the year 1669, when the Abbé Picard published the results of an observation of Arcturus, made when the sun was seventeen degrees above the horizon. This discovery created a sensation among astronomers, who were gleaning at this time quite a harvest among the stars by the use of the telescope, lately invented. Owing, however, to the small object-glasses of the first telescopes, which were only toys compared with the magnificent reflectors and refractors of modern days, the astronomer of the seventeenth century was unable to see more than the principal celestial objects. Several important discoveries were, however, made in that century among which may be mentioned the satellites of Jupiter and five of those of Saturn, together with the ring of the last-named planet. We have still preserved, on the walls of the Royal Observatory, the transit instrument used by Dr. Halley at that place, with an object-glass no larger than that of many modern ship spy-glasses. Let us compare Dr. Halley's small object-glass with one lately constructed for Mr. Newall by Messrs. Cooke, with a clear aperture of twenty-five inches, or with the six-feet speculum in the reflecting telescope of the late Earl of Rosse, and we shall not be surprised that the astronomers of the seventeenth century appeared somewhat elated at having seen a star in broad daylight. This is now a very common occurrence. In the winter days, the writer has frequently observed at noon-day, not only such bright stars as Arcturus, Vega, and others, but occasionally some as small as the fourth magnitude. In short, from the beginning of November to the end of February many such are observed on cloudless days with the transit-circle at Greenwich.

Boötes is figured generally as a robust man holding in one hand a club, spear, pastoral staff, or sickle; for at various epochs he has been represented with each of these symbols. The other hand is upraised towards Canes Venatici. When Hevelius introduced the Greyhounds in his "Uranographia," published in 1690, they were attached to Boötes and placed near the hind legs of the Great Bear. Boötes has therefore been called

the Bear-keeper, and also the driver of the waggon composed of the seven chief stars in Ursa Major. Arcturus was for some time supposed to be the nearest fixed star to the earth; but there have been many others now found to be much nearer. There is, however, no doubt that it is less distant from us than the great bulk of the stars. Epsilon Boötis, sometimes called Izar, is a double star, interesting for the distinct and contrasting colours of its components, the principal one being of the third magnitude and of a pale orange colour, while the companion is of the seventh magnitude, and of a sea-green colour. This star has been frequently seen double in the daylight, although the companion is so small. It is not known at present whether the two stars form a binary system; if so, its period of revolution must extend over not less than a thousand years. Xi Boötis is another interesting object of this class, the principal star being of the third and a half magnitude, and of an orange colour, and the secondary about the sixth or seventh magnitude, and of a purple tint. The contrast between the colours is very brilliant.

We will now devote our attention to the sky north of the zenith, as illustrated by the upper view. The principal northern constellations visible at midnight on May 15th, are Ursa Major, Draco, Cygnus, Ursa Minor, Cepheus, and Cassiopeia, with portions of Leo, Cancer, Gemini, Auriga, Perseus, Andromeda, and Pegasus. First, let us, as usual, give a rapid glance on the meridian northwards, as far as the horizon. Passing over Kocab and Gamma Ursæ Minoris, the eye falls naturally upon Polaris. This standard star is still apparently in the same position as in preceding diagrams, though, to the astronomical observer, it has performed a part of a revolution since January in a small circle round the north pole, in a similar manner to other stars. Polaris is really distant from the pole about one and-a-half degree; consequently its distance from the zenith or horizon differs about three degrees at its upper and lower transits over the meridian. For our purpose, however, Polaris is sufficiently near to the north celestial pole to serve as a zero-point which may be used as an easy reference for the identification of the other stars. The space between Polaris and the zenith, east and west of the meridian, is occupied entirely by Ursa Minor and Draco. The latter constellation completely separates the two Bears. In an old astronomical volume, printed at Venice in 1448, some very interesting figures of the constellations are inserted, including one in which the two Bears are completely enfolded in the embrace of Draco. Virgil, as rendered by Dryden, says:—

"Around our Poles the spiry Dragon glides,
And like a wandering stream the Bears divides."

Although several of the stars in the lesser Bear are of small magnitude, its contour can be readily traced, Polaris being at the point of the tail, and Kocab and Gamma Ursæ Minoris at the other extremity in the direction of the zenith, but slightly west of the meridian. These two stars are easily found, and by drawing a curved line from Kocab to Polaris the intermediate stars, though small, are distinctly visible. Directly north of the zenith, and a little west and east of the meridian, all the bright stars reaching in the west to the Great Bear, and in the east to the constellations Lyra and Cygnus, belong to Draco, the two brightest being Beta and Gamma, almost due east about twenty degrees. The principal portion of the sky west of Draco includes Ursa Major, below which are Leo Minor and Leo, Regulus being near the horizon north of west, but outside the limit of our diagram. The reader will perceive that all the seven principal stars in Ursa Major, Charles's

Wain, are now in the northern half of the sky. He will also notice that the apparent position of this group of stars is very different to that in the first diagram of this series; for whereas the two pointers were in January approaching the upper meridian, they are now farthest from the zenith, and passing onward to the lower meridian below the pole. But their relative positions remain the same, and in whatever part of the sky they may be situated, Dubhe is always nearest to Polaris, and with Merak pointing out its position. The stars in Ursa Major are, perhaps, the most known of any in this part of the heavens, on account principally of their almost equal magnitude. One star Delta, is, however, sensibly smaller than the others, and is suspected to be variable in lustre at intervals of long periods. At present it is ranked only of the third and a half magnitude, while that of the other six is about the second. In the time of Tycho Brahé, Delta was designated of the second magnitude, and in the seventeenth and eighteenth centuries of the third and fourth. A mere glance will show that now it can bear no comparison in lustre with its companions. This great constellation is recommended to the young student as an early lesson in the configuration of the stars; for

"He who would scan the figured skies,
Its brightest gems to tell,
Must first direct his mind's eye north,
And learn the Bear's stars well."

Below Ursa Major, in the north-west, is the bare constellation Lynx, and near the horizon Castor and Pollux may be seen on very fine nights. Between Polaris and the north horizon are Camelopardus and parts of Auriga and Perseus. The two bright stars, Capella and Beta Aurigæ, are circumpolar, and may be observed near the horizon a little west of north.

The north-eastern part of the sky contains at midnight the constellations Cassiopeia, Cepheus, Andromeda, Cygnus, and Pegasus. Several bright stars in Cepheus may be noticed east of Polaris. Below Cepheus in the N.N.E. is Cassiopeia, with its well-known group called the chair, and near the horizon numerous bright stars in Perseus and Andromeda can be distinguished on brilliant moonless nights. The principal objects in Pegasus can also be seen near the horizon in the E.N.E., while Alpha Cygni can be easily found in the same direction, about midway between the zenith and horizon. Vega, which has hitherto been a conspicuous star at midnight in this half of the sky, has passed over the boundary, and is now included in the diagram of the southern half.

The planet Saturn is now favourably situated for observation, passing the meridian at midnight about the middle of the month. We shall therefore take this opportunity of giving a brief account of his telescopic appearance and position in the solar system. Neglecting the host of minor planets between Mars and Jupiter, the number of which now discovered amounts to ninety-seven, Saturn is the sixth planet from the sun, and is one of the most beautiful celestial objects which come under the notice of the star-gazer. Saturn is a stupendous globe, about seven hundred times greater in volume than the earth, surrounded by a series of rings of solid matter, and accompanied in his course around the sun by eight satellites. All this complicated system moves with a common motion so exact that no part interferes with another in their revolution round the sun, which is performed in rather less than thirty years. The mean distance of Saturn from the sun is more than nine times that of the earth, and nearly double the distance of Jupiter. The equatorial diameter of the

ball is 74,000 miles, while its polar diameter is about 66,000 miles; its form is therefore sensibly elliptical, and is something of the shape of a well-flattened orange. Streaks of light and shade have been observed on the ball, very similar to the better known belts of Jupiter, affording some kind of evidence of the existence of currents of air analogous to our trade winds. This supposition would lead us to infer that the surface of Saturn is surrounded by an atmosphere subject to all its attendant meteorological phenomena. Saturn revolves on his axis in 10h. 29m. 16s., consequently a Saturnian day is less than a half of a terrestrial day.

But the system of rings which encircle the central ball of Saturn is by far the most interesting appendage of this magnificent planet. Before the invention of the telescope, the existence of the rings was unknown. Even the veteran Galileo was unable to view them satisfactorily, owing to the low penetrating power of the telescopes of his time. According to M. Arago, this low-defining power of Galileo's telescopes was a source of great perplexity to him. In a letter to the Grand Duke of Tuscany, he announced that the planet was "three-bodied," remarking that when he observed Saturn with a telescope magnifying thirty times, the central object appeared the greatest, the two others being attached, one on the east, and the other on the west side of the principal ball. At a later period Galileo observed Saturn at the time of one of its equinoxes, when the plane of the ring passes through the sun, which then illuminates only the edge of it. On this occasion Saturn appeared to the illustrious astronomer as a perfectly round object; he was therefore led to conclude that his previous observations were nothing more than optical illusions. Galileo died in 1642, and it was not till Huyghens observed the rings, in 1659, that a true explanation of the cause of the phenomenon was given. The gradual improvement in the construction of telescopes soon, however, supplied the means for observing the form and dimensions of the two bright rings as we see them at the present day, excepting only that the superior definition given by modern telescopes has enabled us to make further discoveries of great importance. For instance, the exterior ring, or that farthest from the planet, is seen separated from the intermediate ring by an empty space, showing that they are quite independent of each other. Between these and the ball of the planet, a dusky, or semi-transparent ring has been observed during the last twenty years. The tint, or colour of the rings, is varied, the intermediate ring being the most brilliant of the three. The two exterior rings are opaque, and cast a very decided shadow on the disk of Saturn; but the dusky ring is evidently of a gaseous nature, as a part of the luminous disk can be seen through it. The thickness of the rings is very minute, so much so indeed, that when the edge is precisely directed to the sun, it is nearly invisible even in telescopes of great power. It is assumed from this that the thickness cannot be much greater than 200 miles. At these times of Saturn's equinox, he has the same globular appearance as the other large planets, and advantage is always taken of the invisibility of the rings to obtain accurate measures of the form of the central ball. The phenomenon of the disappearance of the rings of Saturn takes place at intervals of about fifteen years.

The mass, or weight of Saturn, is about ninety times greater than that of the earth. The density is, however, only about the eighth part of that of the earth, or, in more familiar words, a cubic foot of the material of Saturn is eight times lighter than a cubic foot of the material of which the earth is composed. Saturn moves

in his orbit around the sun at the rate of 21,220 miles per hour, and also turns on his axis at the equator 22,216 miles in the same time. It is impossible for any one to view this magnificent object through a large telescope without admiration, especially when the planet is in such a position with respect to the sun and earth, as to exhibit the fullest extent of the rings. Many observers have on such occasions made elaborate drawings, showing all the minute peculiarities of the planet—those by Mr. Warren De la Rue and Mr. Dawes being almost perfect delineations of the disk and rings. Of the eight moons of Saturn, five were discovered between 1655 and 1684—two by Sir William Herschel, in 1789, and one by Messrs. Lassell and Bond, in 1848. The satellites of Saturn are distinguished by the names of Titan, Japetus, Rhea, Dione, Tethys, Enceladus, Mimas, and Hyperion. The three last are very faint objects, visible only occasionally in our largest telescopes. It has been remarked by Sir John Herschel, that at the time Enceladus and Mimas were discovered by his father, “they were seen to thread, like beads, the almost infinitely thin fibre of light to which the ring, then seen edge-ways, was reduced, and for a short time to advance off it at either end, speedily to return, and hastening to their habitual concealment behind the body.”

The following diagram of the path of Saturn is interesting to show the apparent motion of the planet in the heavens from December 1st, 1867, to December 31st, 1868. It must not be supposed, however, that the true path is so irregular as it appears in the diagram, as the apparent retrograde motion from April 1st to August 1st is merely the effect of the direct motion of the earth in its orbit, being, with respect to the stars, relatively greater than that of Saturn. As viewed from the earth, Saturn, for this reason, seems to go backwards in the heavens with respect to the stars near his path.

APPARENT PATH OF SATURN.

On the following days and hours in other months the aspect of the sky will be similar to that at midnight on May 15th. Our diagrams for this month will therefore serve for 10 P.M. on June 15th, for 8 P.M. on July 15th, for 2 A.M. on April 15th, for 4 A.M. on March 15th, and for 6 A.M. on February 15th.

No very striking astronomical phenomenon takes place in May, 1868. Venus is still the most conspicuous evening star, and will adorn the north-western sky till nearly midnight. She sets below the horizon at 11.43 P.M. on the 1st, at 11.49 P.M. on the 15th, and at 11.26 P.M. on the 31st. She will be at her greatest easterly elongation on the 7th.—Mars is a morning star, but is not yet in a favourable position for observation. He rises on the 1st

at 3.52 A.M., and at 2.35 A.M. on the 31st. Jupiter is also a morning star, rising on the 1st at 3.27 A.M., and on the 31st at 1.41 A.M. These two morning planets can only be observed shortly before sunrise.—Saturn is more favourably situated in May than the other planets, being in opposition to the sun on the 23rd; but his low altitude, even when on the meridian, prevents the observation of many of those minute peculiarities of his system, some of which we have briefly described in this article. He is visible in the south-east in the early evening hours, in the south at midnight, and in the south-west in the early morning hours.—The moon will be near Saturn on the morning of the 8th, the planet being nearly three degrees south of the moon. On the 18th she will be near Jupiter. Venus and the moon will be in conjunction on the evening of the 25th; they will be, however, separated by about six degrees; and on the 27th the moon will precede Regulus. Full moon will take place on the 6th, at 6.37 P.M., and new moon on the 22nd, at 6.36 A.M.; and in the last and first quarters on the evenings of the 14th and 28th respectively. The moon will be farthest from the earth on the 13th, and at her least distance on the 25th. In the summer months, when at her greatest phase, or full moon, she is always low down near the south-east horizon in the evening hours after sunset, and passes the meridian at midnight, at a low altitude, due south.

CORAL AND THE CORAL FISHERY.

BY THE AUTHOR OF "WHAT I SAW OF THE AMBER TRADE."

THE immense extent of coral formation found in various parts of the world is seldom fully realised by the many millions of people who only see small fragments of this substance fashioned into ornaments, and exposed either for sale or the gratification of vanity.

When we reflect that the great "Barrier Reef," one thousand miles long, on the north-east coast of Australia, and many other reefs nearly as great in extent in other places, are the growth of animal life, we might almost excuse the belief of the ancient Greek philosopher, that the whole world is either one animal, or a mass of insects.

The growth of what is erroneously called "coral plant," assumes many forms. Sometimes they resemble a gigantic plant, with flowers and leaves. Often they grow like a large tree with leafless branches. Sometimes one stem spreads out into a broad, flat surface, in shape of a fan. Whatever shape the growth of coral formations takes, there is an astonishing regularity in maintaining an equilibrium, each branch being balanced by another opposite, and each stem or main body growing perpendicular to its plane.

Coral, as we see it here, is the bone or shell of an insect, from which the flesh or living substance has been removed. A living branch of coral, when first taken from the sea, has a rough, irregular surface, covered with a slimy substance, and dotted with little spots of what appears to be red jelly. These spots are the coral insects. Examined minutely when growing in the sea, the insect is seen in thousands, each having a room of its own, which it never leaves.

In many kinds of the polypi, or coral insects, the head has a little parasol-shaped cover. The arms, which are furnished with eight claws, are long in comparison with the body, and are generally seen extended for the supposed purpose of gathering food; but what that food really is, I am unable to say.

It is generally supposed that the coral insect is industrious; that it is a builder; and that by its labours, commenced at the bottom of the sea, the coral islands have been formed. This is only partly true. They live and multiply—that is all; and in doing this, a family that starts a habitation at the bottom of the sea, in time reaches the surface at low-water. The structure they form is not elevated one inch above the sea level, for the insect can only live in the warm salt water.

The older the coral shells or bone, the stronger is the colour, and the more difficult it is to procure. The money value of coral depends wholly on its scarcity, or the difficulty of obtaining it, although, as far as use or ornament is concerned, one kind is worth in reality as much as another.

At Honolulu and other places on the Pacific Islands, I have seen houses built of coral, which was as common as granite or sandstone here, and was worth no more. If the many-headed public, who suffer the sorrows of following fashion, could be made to believe that this common coral was seldom found, and was procured with great danger and difficulty from a depth of five hundred feet under water, it would immediately discover some heretofore hidden beauty in that particular kind of coral, which would become a valuable article of commerce. Those who are enslaved by fashion are very sharp in learning from others what is common from what is rare; and, without the slightest regard for the use of an article, the merchants who live principally by the vanity of others, regulate their prices.

To witness the forms of coral structures, one would think that the insects must have some means of communicating with each other at a distance, although they cannot leave their shells. Naturalists may be able to account for some of their peculiarities, but to me there is a mystery in the way they manage to construct formations of coral rock on mathematical principles. When growing in the shape of a tree, what teaches the insect to withhold extending its branches farther in one direction than another? When one tribe of insects commence a structure in the bottom of the Pacific, what enables them to extend it in two directions in a perfect circle until the two ends meet, forming a ring from half a mile to ten miles in diameter? What tells these insects, working in opposite directions, as generations after generations are moving farther from each other, that the circle they are building shall be a large one or a small one? These things, to an observing sailor, unacquainted with the theories of the learned, are always a mystery.

Amongst the South Sea Islands there is a little trade for coral; yet not much is done in fishing for it in the manner I have seen followed in other places. Most of the coral gathered there, of a quality valuable in the market, is obtained in small quantities from the shores of islands surrounded by a coral reef. Fragments of the reef become detached from the main body, and in violent agitations of the sea by storms, pieces of the right kind are sometimes thrown within the view and grasp of man.

The only opportunity I have met for seeing the coral fishery conducted on what may be called an intelligent manner, was off the coast of Africa, where for a few days I was near some natives of Algiers, who were fishing for coralline plants in the same manner pursued in the Strait of Messina. The coral fishery I witnessed was carried on from three feluccas anchored in about seventy fathoms of water. A felucca is the largest and fastest boat used. It has three masts with *lateen* sails, and a jib on a short bowsprit. It is also furnished with

long strong oars. During the time I remained near those engaged in the fishery, all three were visited, and I became familiar with the mode of gathering coral; but, being unable to converse with the men, I could learn nothing about the trade.

Two strong poles, about twenty feet long, are firmly fastened together at the middle, and at right angles to each other. On the under side of the poles is a net made of strong cord, and fastened to the extremities of the poles. A heavy stone, for the purpose of sinking the poles, is fastened where they cross each other, and a strong line is also tied at the crossing. One end of the line is held aboard the felucca, and the net is launched over where the coral branches are supposed to be growing beneath. The net sinks slowly to the bottom; and should it fall over the spot where coral is growing, some of the branches generally become entangled in its meshes, and are broken off and hauled up.

When the net and poles become firmly entangled below with large branches of coral, much force has to be used in freeing them, and often the end of the line has to be fastened to the windlass, and a few turns given to bring the net from the bottom. Only small portions of any large mass brought up on such occasions are of any value. Sometimes the net becomes so firmly fastened below, that it is torn in pieces in extricating it. It not unfrequently happens that the line by which the net is drawn up breaks, although, to avoid this, it is always made of larger and of stronger material than the net. Often the net is pulled to the surface and not the smallest fragment of coral is found attached to it. On one occasion I saw, as the net was brought near the surface, a large branch of bright red coral, which was hailed by the Algerine fishermen with shouts of delight. The instant the poles spreading the net touched the stem of the felucca, the branch, which was only hanging by what is best described as a twig, broke away and was lost. There was a sudden transformation of Algerine features from expressions of joy to those of anger and disappointment.

Notwithstanding these little misfortunes, the coral fishers are engaged in a profitable business, and make during the season, which lasts from the middle of April to July, enough to keep them, with a little economy, the remainder of the year. Should they be successful at every cast of the net, the coral, such as they procure, would become too common to please those affected with an insane desire for anything that requires time and toil in procuring.

The price of rough coral varies according to its quality and colour. The whims of changing taste, or want of taste, and the quantity in the market, have much to do with its value. I have seen it sold for about two shillings per pound, and have seen some sold for more than fifteen shillings. The great market for all the cheaper kinds of coral sold, is Africa, where it is an important article of commerce, finding its way far into the interior of the country, and is eagerly purchased by the natives for ornaments.

DER BLAUEN SEE.

In a corner of the French picture-gallery in the Paris Exhibition, there hung a small picture which, at a passing glance, might be thought an over-coloured and exaggerated fancy landscape. It represented a little blue lake, surrounded by rugged rocks, dark fir-trees, and all the charming accompaniments of Swiss scenery. Many pleasant associations recurred to my mind as I

recognised the scene, which I will now endeavour briefly to describe by way of protest against any charge of excessive colouring or artistic licence in the picture.

We had been travelling in Switzerland—a merry party of nine—and arrived one bright August afternoon at Kandersteg, the well-known village at the northern base of the Gemmi Pass. No sooner had we arrived there, however, and installed ourselves comfortably in *Hôtel Victoria*, than a fog came on, accompanied by large, heavy intermittent rain-drops. This did not augur favourably for the weather on the following day; and, as we had been unfortunate in crossing the Great Scheideck and Wengern Alp, entirely enveloped in clouds and rain, we decided to halt a whole day at Kandersteg, hoping that the weather might clear for the passage of the Gemmi. It grew very chilly as the evening wore on, and we were all delighted when the civil waiter, hearing our exclamations at the cold, brought in an armful of wood and quickly lit up a blazing fire. Two young English tourists came in about seven o'clock, tired and hungry, and after they had finished their evening meal we grew sociable, and endeavoured to arrange ourselves in English fashion round the fire. This was difficult, with the fireplace most awkwardly built quite in a corner of the *salle à manger*, and we must have formed a curious-looking group when we were all seated, with one whose feet were cold perched on the high mantel-shelf, and another, who had been bathing in a glacier-stream, and wanted to dry his hair, squatted on a low stool, with his head up the chimney. I forgot to mention a very pleasant French artist staying at the hotel, whose name we did not hear, though I have every reason for believing him to be the painter of the picture described, in the Paris Exhibition.

I always seized opportunities of this kind to study and compare the guide-books, of which we carried four by different authors. As I was doing so this evening, one of the Englishmen remarked that the prettiest sight in the neighbourhood was not mentioned in the guide-books.

"Indeed!" I replied. "May I ask what it is?"

"It is a small lake," he answered, "about two hours from here, between this and Frutigen. We were told of it by a Swiss, and we turned out of the road this afternoon to see it."

"Go and see it by all means," echoed his companion. "It is in its way quite a wonderful sight, or at least very interesting, and deserves to be much better known by tourists than it is."

I instantly turned to Ball's "Alpine Guide," my favourite amongst the books, fully expecting to find a description of it there, in spite of what had been said to the contrary; but no: the young tourist was quite right; it was mentioned neither in Ball, Baedeker, Murray, nor Bradshaw. The French artist was also enthusiastic about the little blue lake, and told us that it was known by no other name than *Der Blaue See*, and how he had sketched it, and what a unique study it made for a picture. We instantly resolved to make an expedition thither the following day, should it prove fine enough.

I started in the afternoon with one of my companions, and, after descending the steep hill that leads up to Kandersteg, retracing our steps of the day before, and walking for about an hour, we came to a bit of ruined castle, perched on a high rock that rises close to the road, on the right-hand side walking north. This was to be our land-mark; for we had been told to turn in from the road on the left, just opposite this old ruin.

We soon spied a footpath, leading across a plank laid over a narrow stream, and through some meadow-land bestudded with flowers. We followed this path, and presently saw a boy approaching us from a *châlet* on the other side of the meadow. He was a poor cretin, and could give us no information. The footpath, however, only led up to the *châlet*, at the door of which a woman sat knitting. From her we again attempted to learn the whereabouts of the *Blaue See*, but were again unsuccessful. Whether that *châlet* was inhabited by a family of cretins, I know not; but the woman only shook her head helplessly and muttered unintelligibly.

Returning to the road, we accosted two men who were building a *châlet* close by. They seemed very honest and intelligent, and when I held up forty centimes, and promised them to the man who should guide us to the *Blaue See*, one of them instantly threw down his tools and led the way.

We followed him by a little path very much like the one we had taken ourselves, but at a point rather higher up the road. Then began a real scramble, with no kind of path to guide us, first up a grassy hill, then through a wild glen, down which a little mountain stream was hurrying. This our impromptu guide pointed out as issuing from the *Blaue See*. Then we crossed the *Kander* (that flows all through this valley into the Lake of Thun), by a rough plank thrown over it; and after issuing from the wood, and climbing another steep grassy knoll, we looked right down upon the little blue lake. It was surrounded on two sides by fir-trees growing down to the water; on another by the steep rocks that bounded the narrow valley we were in, and on the side from which we overlooked it by low rocks rising roughly from the water's edge, but sloping away from the lake into rich meadow-land literally strewn with flowers.

The water was intensely blue—not the hazy cobalt of Lake Lemman, or the greeny blue of a deep sea, but a clear dark blue, unlike anything either of us had ever seen before. Two or three of the fir-trees had been uprooted—apparently by some tempest—and fallen into the lake; there they lay covered with what looked like a glistening crystalline deposit, every twig being distinctly visible through the clear blue water. This transparency was another peculiarity about the little lake; it was so clear, we could see every pebble that lay at the bottom, shining white and silvery like the fir-trees, for everything looked perhaps whiter than it really was, by contrast with the dark blue water.

This naturally deluded us into imagining the lake to be but a few feet in depth, though the artist told us afterwards that it was really much deeper.

I do not know whether I have done full justice to the beauty of the scene, or whether I have succeeded in conveying to my readers the same impression that it made upon me. It was little short of enchantment, and just as if some woodland fairy, wishing to prolong a moonlight effect, had by a touch of a magical wand changed every hue to silver and blue, and then carefully hidden it away from mortal eyes. Perhaps it would have looked still prettier in the sunshine; for I should mention that the sun had set, or rather disappeared behind the hills, by the time we arrived at the spot, although it was only half-past four on an August afternoon. It is often the case in these mountain regions for the sun to rise and set in the deep valleys several hours after or before it does so to the rest of the world. The inhabitants of the valley of *Lauterbrunnen*, for instance, never see the sun in winter until twelve o'clock in the day.

We were vexed when, with all our efforts, we could not make our guide understand that he might leave us to rest there, and find our way into the road again ourselves, for he persisted in waiting to conduct us back. He then led us partly round the lake, through the fir-wood, and along a wilder path than the one by which we had come. He pointed out the bit of ruined castle on the rock as Der Felsenberg, and when he had put us into the road again, civilly wished us good night, and went off quite contented with his forty centimes.

We sat round the fire that evening, discussing the cause of the singular blueness of the Blauen See. One thought it must be due to the action of sulphate of copper on the water, and all wished that we had brought some away in a bottle for analysis.

We were also comparing it with the Oeschinen See, another lake in the neighbourhood of Kandersteg, whither, in tourist-like obedience to guide-book directions, we had all made an excursion the same morning. I greatly preferred the Blauen See, but others differed from me; and certainly the Oeschinen See is romantic enough. Its celebrity consists in its great altitude, and in being entirely surrounded by snow-peaks (the principal of which is the Blümlis Alp), except on the west side, where a narrow valley opens on to a wild ravine, by which we ascended to see it. A German family joined us for this excursion, and we made a merry party altogether; consisting of five ladies and an elderly gentleman on horses, two ladies who were unequal to riding, in *chaises-à-porteurs*, eight bearers with two assistants, and six pedestrians. We had not gone far when one of the men commenced singing a wild Swiss air. His nine companions joined him one by one, in perfect harmony, and swelled the chorus till it echoed and re-echoed among the mountains, and then the voices gradually fell off until it quite died away. They kept on bursting out with it in this way one after another, during the whole expedition.

It appeared that they always began to sing as they came to a rough or difficult part of the road, to warn one another of it, and cheer themselves on. It would be well if we could all learn the life-lesson contained in this simple incident, to cheer the rough places in life's pilgrimage with songs of warning and encouragement. The fact that most of the men belonged to one family, by name Ogi, who act as guides, porters, bearers, etc., to the numerous visitors to Kandersteg, or travellers over the Gemmi, may partly account for the exquisite way in which their voices harmonised.

The Oeschinen See is much larger than the Blauen See, and this, with the snow peaks round, makes perhaps a grander scene than the other; but for all that I like the little blue lake best, and was delighted to recognise it as a perfect gem in landscape scenery, amongst many larger paintings in the French Exhibition.

THE REIGN OF LAW.

It is interesting to note how two independent thinkers, exercising their minds on the same general topic, in different ages, both with the same grand wish to glorify God as the moral Governor of the universe, have unconsciously approached each other. We subjoin from the famous treatise of Hooker, "Ecclesiastical Polity," and from the now famous work of the Duke of Argyll, "The Reign of Law," parallels, not of language, nor of sentiment, nor even of thought, but of general subject. The profound conceptions of the great Elizabethan divine are in fine contrast with the practical, clear, and

full illustrations of the modern philosopher. Space will only allow the following instances:—

DESCRIPTION OF LAW.

From Hooker.

All things that are, have some operation not violent or casual. Neither doth any thing ever begin to exercise the same, without some fore-conceived end for which it worketh. And the end which it worketh for is not obtained, unless the work be also fit to obtain it by; for unto every end every operation will not serve. That which doth assign unto each thing the kind; that which doth moderate the force and power; that which doth appoint the form and measure of working—the same we term a Law. So that no certain end could ever be attained, unless the actions whereby it is attained were regular; that is to say, made suitable, fit, and correspondent unto their end, by some canon, rule, or Law, which thing doth first take place in the works even of God himself.

From the Duke of Argyll.

The whole world around us, and the whole world within us, are ruled by Law. Our very spirits are subject to it—those spirits which yet seem so spiritual, so subtle, so free. How often in the darkness do they feel the restraining walls—bounds within which they move—conditions out of which they cannot think! The perception of this is growing in the consciousness of men. It grows with the growth of knowledge; it is the delight, the reward, the goal of Science.

THE UNIVERSE WITHOUT LAW.

From Hooker.

Now, if Nature should intermit her course, and leave altogether, though it were but for awhile, the observation of her own laws; if those principal and mother-elements of the world, whereof all things in this lower world are made, should lose the qualities which now they have; if the frame of that heavenly arch erected over our heads should loosen and dissolve itself; if celestial spheres should forget their wonted motions, and by irregular volubility turn themselves any way, as it might happen; if the prince of the lights of heaven, which now as a giant doth run his unwearied course, should, as it were, through a languishing faintness, begin to stand, and to rest himself; if the moon should wander from her beaten way; the times and seasons of the year blend themselves by disordered and confused mixture; the winds breathe out their last gasp; the clouds yield no rain; the earth be defeated of heavenly influence; the fruits of the earth pine away, as children at the withered breasts of their mother, no longer able to yield them relief; what would become of man himself, whom these things now do all serve? See we not plainly, that obedience of creatures unto the law of nature is the stay of the whole world?

From the Duke of Argyll.

Each force, if left to itself, would be destructive of the universe. Were it not for the force of gravitation, the centrifugal forces which impel the planets would fling them off into space. Were it not for these centrifugal forces, the force of gravitation would dash them against the sun. The orbits, therefore, of the planets, with all that depends upon them, are determined by the nice and perfect balance which is maintained between these two forces; and the ultimate fact of astronomical science is not the law of gravitation, but the adjustment between this law and others which are less known, so as to produce and maintain the existing solar system.

THE RESULT OF THE INQUIRY.

From Hooker.

Wherefore that here we may briefly end. Of Law there can be no less acknowledged than that her seat is the bosom of God, her voice the harmony of the world; all things in heaven and earth do her homage, the very least as feeling her care, and the greatest as not exempted from her power; both angels and men, and creatures of what condition soever, though each in different sort and manner, yet all, with uniform consent, admiring her as the mother of their peace and joy.

From the Duke of Argyll.

The laws of nature were not appointed by the great Lawgiver to baffle his creatures in the sphere of conduct, still less to confound them in the region of belief. As parts of an order of things too vast to be more than partly understood, they present, indeed, some difficulties which perplex the intellect, and a few also, it cannot be denied, which wring the heart. But, on the whole, they stand in harmonious relations with the human spirit. They come visibly from one pervading Mind, and express the authority of one enduring Kingdom.

THE LEISURE HOUR

A FAMILY JOURNAL OF INSTRUCTION AND RECREATION.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—*Cooper.*

THE TWO HENRYS.

THE MORTONS OF MORTON HALL.

CHAPTER XXXIII.—IN WHICH HENRY TALBOT WRITES TO HIS SISTER FROM THE SHORES OF LAKE MICHIGAN, AND MAKES SOME STRANGE DISCLOSURES.

AMAZED to witness such evidences of refinement and luxury, as it were on the very confines of civilisation, Henry Talbot stood for a few moments utterly bewildered, as though he were doubtful in his own mind whether this was but another phase of some vivid dream.

Miss Morton made some remark, but he did not answer—he scarcely heard her; and it was not until she

repeated her words, and, pointing towards the window, against which the rain was now beating furiously (the shower, accompanied by a violent squall of wind, having come down suddenly, as is usually the case in the forest-grown districts of the Far-West), added playfully—"I think Mr. Talbot might be more grateful to me for having delivered him from durance vile in the forest on such a night as this promises to be," that he woke up with a start and made a confused apology for appearing in his present travel-stained condition.

The young lady smiled at his evident confusion, and went on, addressing her brother—

"I perceive, Henry, that Mr. Talbot will not be at ease until he is permitted to make some changes in his toilet. He is still a novice to our far western customs, and has yet to learn that we sometimes necessarily set aside the conventionalities of civilised society in the backwoods. He fancies that a traveller should carry a portmanteau with him in the wilderness, in order that he may appear *en règle* in the presence of a lady at the end of his journey. Had I waited to listen to him he would have detained me till the storm came on, while he apologised for appearing before me in the forest in travel-stained apparel."

This speech was not calculated to set the young man at ease. He blushed deeply as he glanced at his soiled garments and worn-out shoes, which looked all the more wretched and poverty-stricken in contrast with the neatness and elegance with which he found himself so suddenly and unexpectedly brought in contact; and he felt relieved when Henry Morton led him from the room, and, conducting him to his own chamber, placed his wardrobe at his disposal.

"You forget," said the young Englishman, "that I have no other clothes coming, that I have no garments except these I wear. Everything was lost."

"The better reason that you should avail yourself of my offer," interrupted Henry Morton. "Of course you lost everything, and were lucky in not losing your life into the bargain. You must just put up as well as you can with what my wardrobe offers, until you can rig yourself out again. Come, not another word of apology. I should expect *you* to act the same towards *me* if our relative positions were changed."

As he spoke he drew forth several suits of clothing, most of which were adapted to the backwoods, though, to Henry Talbot's surprise, there were two or three complete suits of broadcloth, suitable for morning or evening wear in the cities.

"You see, living as we do far distant from any place where we can readily procure fresh supplies," the young backwoodsman went on, "we are obliged to keep a largish stock of everything needful, though some of these garments are seldom or never worn. What do you say? Will you try how a hunter's costume suits you? You and I are about the same size, and I daresay all my clothes will fit you. Or will you still adhere to the conventionalities and try a dress suit?"

The smart hunter's costume worn by Henry Talbot set off his tall, athletic figure to great advantage, and was, as the young Englishman thought, more in accordance with his surroundings, and better adapted to the daily habits of his life, than the ordinary costume worn in cities; and after some hesitation he selected a similar costume from the wardrobe.

"You have chosen wisely," observed young Morton. "For my part, I'd never wear any other dress if I could help it. Now (opening a drawer) here you'll find linen and anything else you may require. Take what best suits you. And now I'll leave you to your toilet. By the time you're ready I'll return and escort you back to the parlour. And—I say—don't mind Mary's jokes, She's a good girl, and you'll like her very much when you come to know her."

An English Bible, very old and worn, and apparently stained and soiled by time and use, lay on the dressing-table. Henry Talbot carelessly opened it, and saw that the fly-leaf was covered with a list of names, with dates of birth attached. The ink was yellow and faded; but the names—all Mortons—were still legible.

"You are shocked to see a Bible in such dilapidated condition," said Morton. "But that little book has

seen hard service. It is my father's, and was given to him by his sister, when he left home—a boy—to go to sea. My father preserved that book, and a trinket also given him by his sister, amid shipwreck and peril of every description. It has hitherto accompanied him in all his travels, for he values it highly. The names are those of his father and mother, himself, his brothers and his only sister. It did contain a certificate of his birth and baptism, that his mother had previously placed in his Bible when he was a child; but when he left home he cut it out of his own Bible and pasted in that which he brought with him. He took the certificate and the trinket to England with him—why I cannot say: nor why he left that book behind him, I verily believe for the first time in his life. But I'm keeping you from dressing with my idle clatter;" and with this the young man left the room.

Left to himself, Henry Talbot began to reflect upon the singularity of his position.

It was evident to him that Mr. Aston, who, he was confident, was the father of his new friends, had not acquainted them with the fact that he had adopted an assumed name in England. They spoke of their father as "Mr. Morton," and expected that he (Henry) would understand to whom they alluded; and while he wondered *why* Mr. Morton had assumed the maiden name of his deceased wife, he thought it very strange that he had not informed his children that the visitor he had led them to expect would only know him by his assumed name. Other thoughts passed through his mind. He began to suspect who Mr. Morton really was. He recollected many strange questions that the *soi-disant* Mr. Aston had put to him at different times, which at the moment he could hardly understand, but which now seemed plain enough. He had heard from his mother something of her youngest brother's early history, and the little episode of the pocket Bible confirmed certain suspicions that had begun to enter his mind from the moment when he had first heard the names of Aston and Morton coupled together, and had increased since he had fallen in with his youthful guests. He opened the Bible again, and read the almost faded names. They were those of the grandparents and uncles whom he had never known; and the last two on the page were those of Henry and Mary Morton, whose dates of birth exactly corresponded with those of his mother and her favourite long-lost brother. "Mr. Aston is—he *must* be my uncle Henry," he soliloquised. "He has purposely concealed his name from Mary and me, though, I daresay, he would have explained all about it to his children before now, had he not believed me to have been lost at sea. But how am *I* to act under these strange circumstances?"

And after some consideration he came to the conclusion that it was advisable, at least for the present, to continue to speak of the *soi-disant* Mr. Aston as Mr. Morton, and to conceal his own suspicions from his youthful host and hostess.

While thus soliloquising and considering, he had effected a complete change in his attire. Though Henry Morton was somewhat taller and stouter than himself, the garments fitted tolerably well, and he was admiring and wondering at the change they made in his personal appearance, when young Morton returned.

"Famous!" he exclaimed, as he entered the room unperceived, while the young Englishman was still surveying his reflected form in the looking-glass. "I declare you might have been a backwoodsman all your life. Stand forward and let me criticise."

The garments Henry Talbot had selected consisted

of a tunic of green chamois leather, fringed with martin fur, and pantaloons of tan-coloured buckskin, also fringed with the same kind of fur down the outer seams. The frock was left open in front, to display a shirt of the whitest linen; and in place of his worn shoes he wore a pair of braided and beaded mocassins.

"Famous!" repeated young Morton, after a brief survey. "You have forgotten one thing, though. You have no belt;" and, opening another drawer, he drew forth a scarf of the finest and brightest scarlet worsted, and bound it somewhat tightly round his young guest's waist.

"There! Now you are perfect," he said; "and I defy even Mary's sharp eyes to detect a fault. Come. Dinner is waiting. Fortunately we dine late to-day. Mary was out trying her new pony, and I had business at a trading-post ten miles off. Usually we dine at two o'clock.

"Wheew! How the rain pours down! Isn't it lucky that Mary fell in with you?"

While thus speaking he had taken Henry's arm, and the two young men were retracing the long passage together.

"Mary *will* be surprised," young Morton went on. "She expects to see you re-appear in broadcloth. But she's a sensible girl, and she'll like you all the better in the garb of a backwoodsman."

He was right in his surmise. The young lady sprang from her chair as her brother and his guest entered the dining-room, to which she had adjourned during their absence, and, clapping her hands with glee, she exclaimed—

"The two brothers, I declare! But which is he of Ephesus, and which of Syracuse? I hardly can tell one from the other; and you are both Henrys too."

"Let me look at you. Ah!" (addressing her brother)

"I see now that you, sir, are Henry Morton.

"Please to take the head of the table, Mr. Morton. And you, Mr. Talbot, will occupy this seat by me.

"Really, Henry—you, my brother, I mean—you must look to your laurels. Hitherto I have fancied you the very beau-ideal of a young backwoodsman; but Mr. Talbot has merged at once from a pale chrysalis of the settlements—and a poor specimen of that," she added, laughingly, "into a full-blown hunter."

The fare to which the little party sat down comprised all the delicacies of the backwoods; viz., venison in various forms, and bear's-meat steaks, and wild pigeons, and fish from the lake, with various preserved meats from the settlements, as the cities of the Atlantic coast are usually styled in the Far-West; and, at the period of which I write, the west shore of Lake Michigan was the extreme limit of civilisation. Nor was there any lack of wine and other liquors, besides the native cider. The table, also, to Henry's astonishment, was set out with everything that might have been expected at the table of a wealthy citizen of New York or Boston. The spoons and cruets were of silver (and also, to Henry's amazement, were engraved with the crest of the Mortons, his mother's family), and every other arrangement was perfect. The only circumstance that would have attracted notice in a city was the absence of servants.

Perhaps Miss Morton remarked Henry's wonder at this; for, turning towards him, she said, with a smile—

"We have to help ourselves out in the backwoods, Mr. Talbot. We might as well expect our 'hired help' to fly as to wait upon us at table; and really, so far as I am concerned, I rather prefer the liberty of helping myself, without the attendance of listening servants."

Henry Talbot had now an opportunity to regard the

young lady with closer attention than he had hitherto dared to bestow upon her. He found her to be really a very pretty girl, with regular classic features, dark blue eyes, and a profusion of auburn hair, which was permitted to flow naturally over her neck and shoulders. She appeared to be about the age of his own sister Mary, but she was taller, and, though now slender and graceful in form, she gave promise of future *embonpoint*. The expression of her countenance was gentle and truthful, yet she looked as if she were able to assert and maintain her own will, if she were thwarted in her desires; and, in fact, she was in every respect a feminine counterpart of her brother, while in both the brother and sister he could trace a strong resemblance to their father.

The more he looked at and listened to them, however, he was the more astonished to find two such young people in such a situation as that in which he had met them, where the last thing he would have looked for was education and refinement.

Later in the evening, however, when they had retired to the parlour, his astonishment in this respect was modified on learning that Mary Morton had been educated at one of the best boarding-schools in the State of Massachusetts, and that her brother, after his previous education at a grammar-school, had gone through a course of study at Yale College, where he had carried off some of the highest prizes.

"Do you like this life in the backwoods, Miss Morton?" he ventured to inquire, in the course of the evening, after the young lady had gratified himself and her brother by her performance on the piano.

"I did feel it somewhat lonesome at first," she replied, "until Henry came home from college. Now, I rather like it, though I don't think I should care to spend all my life in the Far-West. The worst thing about it is the lack of society, especially of female society. I *can* get along with the men, but I cannot with the women. I dare say they think me proud, poor things; but that is not the case, I'm sure. Still, one must have *some* education and refinement in one's female companions. As to my brother, there is not a better backwoodsman in the West than he. Henry insists that a thorough backwoodsman must be an educated man, otherwise he is unable to enjoy half the pleasures that the forest affords; and I think he is right."

Later in the evening, after the brother and sister had been speaking of England and other European countries, and asking several questions relative to their father, the young lady remarked—

"From the tenor of papa's letters, I should not be at all surprised if he were to determine upon selling or making some other arrangement relative to his American property, and taking up his residence in England altogether. He has pined after his native land, I fancy, ever since poor mamma's death. In that case, of course, I should rejoice him there."

"And your brother?"

"Of course Henry would go with *me*; but I think it probable that papa would make over the American property to my brother, in which case he would return to this country."

"And you—would you like to live in England?"

"I should much like to visit England, and also to travel on the continent of Europe. Whether I should prefer to reside in England I cannot say, until I have seen the country and learnt to know the people."

A room in the house was appropriated to Henry Talbot by the brother and sister, and, had he so chosen, he might have remained with them as their guest for

months, or for any unlimited period; but he took an early opportunity to acquaint Henry Morton with his desire to procure employment on the lake if possible; and though the latter tried to dissuade him from this, as being unnecessary, at least for the present, he persisted in his purpose, and, through the young squire's influence, he soon obtained the appointment of purser on board the Franklin, the largest vessel that then navigated Lake Michigan.

A letter which he wrote to his sister at this time will afford a better idea of his position, and of his hopes in the future, than any description that I can give.

After having acquainted Mary with all the details of the seizure of the Amazon by pirates, and of all his subsequent adventures (known to the reader) up to the date of his letter, he went on to say—

"I am now employed, nominally, as purser of the Franklin, a brig of some three hundred tons burden; but I am really acting as a sort of purveyor-general to all those vessels on the lake which belong—to whom do you think? To none other than our friend Mr. Aston, of St. David!

"It was to *his* children I came, after I left St. Louis, as I have narrated above. As soon as they learnt that I was acquainted with their father, they gave me a hearty welcome, and we, that is, Mr. Aston's son and daughter, Henry and Mary—you perceive they are namesakes of ours—became immediately the best friends in the world. I like them very much, and so will you like them, if by any chance you should come to know them; and, as they have some idea of visiting their father in England, it is not at all improbable that you will some day be introduced to them.

"Henry, who is four or five years my senior, has been educated at one of the American colleges, and possesses a far better acquaintance with the Greek and Latin classics than I have. He reads *Æschylus* and *Herodotus*, and *Ovid* and *Cicero*, with perfect ease, and is a very fair modern linguist. Yet withal, he is no puny book-worm, but a fine, manly, handsome fellow, who can ride, swim, and row a boat or paddle a canoe to perfection; and moreover, he is an excellent sportsman, and can hit a mark the size of my hand at five hundred yards with a single bullet, without ever missing; at least, I have never seen him miss, and I have seen him shoot scores of times.

"Mary is about your own age, and has been educated at one of the best boarding-schools in Massachusetts—the literary State of the Union, *par excellence*. She is a skilful musician; she speaks French and Italian, and sketches very prettily from nature, and rides as well and almost as fearlessly as her brother. Yet she is no tomboy, but a very pretty, fair-haired, blue-eyed lady-like girl, fond of fun, but very good tempered. If I write any more about *her*, you will be thinking that I am in love with her, so I shall leave you to fill up my sketch of her from imagination.

"When I am up at the 'Place,' as our friend's house is called, which is very often—for my duties keep me much more frequently on shore than afloat—we sit down to dinner, out here in the backwoods, to a table that would not disgrace the dining-room of a London alderman, not only so far as the viands and wines, but the furniture and garniture of the table are concerned. I can assure you I was amazed on my first arrival, to find such comforts and luxuries as the 'Place' affords, in the extreme Far-West of America, and still more amazed at the appearance, manners, and conversation of my youthful host and hostess.

"As to the 'Place' itself, it is a large, straggling

residence, rather resembling a number of better-class cottages built into one, than one single dwelling. It presents, however, a very picturesque, though strange appearance from the outside, being built partly of stone and partly of wood painted white, with a very irregular red roof. Inside it is the picture of neatness and comfort. The rooms are numerous, and it is very handsomely furnished, in a style well adapted to such a 'Place.'

"Henry and Mary live as happily as if they were the prince and princess of the land, which, in one sense, they are, since Mr. Aston is the proprietor of thousands of acres of land on the west shore of Lake Michigan, and must be a very rich man.

"Besides the 'Place,' however, the settlement of Watertown consists of merely a few log cabins, inhabited by the 'hired helps,' that is to say, the farm labourers, etc., etc., of Mr. Aston; and the surrounding country would be very charming, if it were not that, a few miles beyond the 'clearing,' the land is covered with forest, which extends, I imagine, to the Rocky Mountains on the one hand, and to the North Pole on the other, and conceals everything from view, while the 'clearing' itself is so completely disfigured by the charred stumps of what once were forest trees, that it looks for all the world like an overgrown pauper cemetery, which has been filled up and let out for farming purposes.

"Now for a few words about myself again—

"My duties are to go from trading-post to trading-post, sometimes on shore and sometimes on board the Franklin, or some other of Mr. Aston's vessels, to sell and purchase cargo, and to purchase provisions and make arrangements of various kinds. I also keep all the accounts. For the performance of these duties I receive a salary of fifty dollars (£10) a month, and have everything found me, and my land travelling expenses paid. It is hard work sometimes, but pleasant because of its variety; and the pay is not bad to commence with.

"I have said nothing about your rejoining me out here, nor anything of my proposed future movements, since they are quite uncertain. It is not *improbable*, indeed, that *should* Henry and Mary visit their father in England, I may return home with *them*.

"As to yourself, my dear sister, I hope that you are still happy at St. David, and that you retain your usual good health and spirits. You must accept the reasons I have given—absurd as I daresay you will deem them—as my excuse for not writing sooner, and letting you know that I was still in the land of the living, while I have no doubt you believed me to have perished at sea.

"However, dear Mary, think you what you may, I was much cast down at the wreck of all my bright hopes and anticipations, and the sudden collapse of the fine castles I was so fond of building before I came out from England.

"It seemed to me that the loss of the two hundred pounds, with which I had hoped to accomplish such great things, was a just retribution, sent to punish me for the improper manner in which I became possessed of it. I had really no business to take it, and I often thought so during my thinking moments on shipboard, and I still remember that—though I am confident that he from whom I obtained the money will never put me to trouble about, or prosecute me for its repayment—I must some day make restitution, and it is a large sum to make up.

"Speaking of the lost two hundred pounds reminds me of your locket. If you have hitherto shown the keepsake to no one, I still wish you, for special reasons that I cannot now explain, to keep your possession of it

a secret from every one, and *especially* from Mr. Aston. Some day, perhaps, you may wear it openly.

"And now I must close this long letter. I shall look eagerly for a long letter from you, my dear Mary, by the next packet, and should be more anxious than I am, had I not heard, through Mr. Aston's last letter to his children, that you were in good health.

"Please give my kind regards to him, and all other friends at St. David, and to good old Mrs. Margaret, when you write; and meanwhile, till I write again, believe me, my dear Mary, ever

"Your affectionate brother,
"HENRY."

It will be remarked that Henry Talbot did not once allude to the name of Morton in the above letter, but spoke of his new friends as Henry and Mary, the children of Mr. Aston. If he had any suspicion of their relationship to himself and his sister, he kept those suspicions secret.

The fact really was, that before he disclosed anything he suspected, to them or to his sister, he wished to learn from Mary's reply, whether Mr. Aston had made any disclosures to her. If he had not, he held himself bound in honour not to betray the secret he had accidentally discovered, without Mr. Aston's permission. He had, however, no doubt in his own mind that the *soi-disant* Mr. Aston was his long-lost uncle Henry Morton, and that his youthful hosts at Watertown were his cousins.

CHAPTER XXXIV.—MARY TALBOT AT HOME.

WHEN the intelligence of Mary Talbot's relationship to Mr. Aston (who, for reasons known to the rector alone, still chose to retain his assumed name) became known throughout the village, great astonishment was manifested. She was generally congratulated upon the discovery of an uncle who was not only able but anxious to befriend her; and though Mr. Sinclair and his niece at first contemplated with some anxiety the probability that the discovery would lead to her resignation of the situation she held, and in which she had rendered herself necessary and almost invaluable to them, their minds were soon set at ease by the young lady herself, who declared that it was alike her own and her uncle's wish that, for the present at least, she should continue to perform her customary routine of duties.

"It is some consolation to me to find that I am not utterly alone in the world," she observed one day, soon after the discovery, to Miss Wardour; "and though this knowledge cannot compensate me for the loss of my only brother, I try to be—I *am*, thankful to Him who, in the midst of my sore trials, has given me so many kind and sympathising friends; but Henry and I were all in all to each other."

"It is hard to suffer these trials, dear Mary," said Miss Wardour. "Still, we must try to believe that though the ways of Providence are inscrutable, everything is ordained for the best."

"I cannot, I cannot," cried Mary. "It is vain to urge me," and she gave way to a burst of grief that she was unable to restrain.

Miss Wardour made no effort to restrain the sorrowing girl's tears. She felt that there are times when any attempt at consolation is resisted as an intrusion by those who are suffering from the first smart of a sore affliction, and in a few minutes Mary became more composed.

"Forgive me, dear Miss Wardour," she said, taking her friend's hand, "and may Heaven pardon me. It is wrong, I feel and know it is wrong, to doubt the wisdom

and goodness of Providence. I hope the day may come when I shall be able to say, 'All is well;' but I cannot now—I cannot indeed. Do not urge me. You only make me feel my loss more keenly. Leave me to my own thoughts, and I will strive, I will pray for submission. But let that be between me and Him who has seen fit to try me so severely."

"You will not remain here now, I presume," said Miss Wardour, after there had been a few minutes silence. "I do not mean that you will leave us. I am aware that you and your uncle have arranged that you are to remain with us. But you must feel lonesome here by yourself in the farmhouse. It was but a week ago that my uncle and I were talking on that subject, and we almost decided to offer you a room at the Rectory. Now, however, I suppose you will go to reside with your uncle."

"No," replied Mary; "I have never felt lonesome here. My uncle does wish me to remove to Cliff Cottage; but I have decided to remain here, where Henry and I spent our last hours together.

"Once—but a little while ago," she went on, "I did think of leaving St. David altogether. I had reasons. Perhaps some day I will tell you what they were—not now. But even then I should have regretted to have given up my charge, now that the children have become so attached to me."

"We should hardly have liked to ask you to remain," said Miss Wardour, "had you not decided to do so of your own accord, though we should have missed you sorely. You have no idea, my dear Miss Talbot, how highly my uncle values your assistance."

"Henceforward you and I must be closer friends than ever."

Miss Wardour then spoke of several new projects that her uncle was contemplating, with a view to improve the condition of his poor parishioners, and thus sought to divert her friend's mind from dwelling upon her troubles; and to a great extent she was successful in her endeavours.

"You are very kind," said Mary, when Miss Wardour was about to take her departure for the night. "I hope I shall never give way again as I did just now; but I cannot bear people, however kind their intentions, to try to console me—not just yet. I can think over more calmly and dispassionately when I am left to myself."

So Miss Wardour embraced her young friend and departed, leaving her alone with her sorrows and her reflections.

THE POST OFFICE.

WE have often taken occasion to speak of the progress of the Post Office—a progress, the details of which are duly announced in the Postmaster-General's Annual Report. Instead of giving the mere statistics of the last year, we extract from a recent article in the "Times" some passages likely to interest our readers:—

The number of letters, which in the year 1839 was estimated at 75,907,572, in the first year of the reduced tariff increased to 168,768,344, and has gone on increasing without a check to the present time, in a higher ratio than the increase of the population. In the year 1865 the number of letters had risen to 724,460,000, the books and chargeable newspapers to 97,250,000, and the samples and patterns-post to 1,280,990,000, making a total of 818,990,000 articles carried within the year by the Post Office—a number which had probably increased,

by the end of last year, to the magnificent proportions of 1,000,000,000. Such numbers as these stagger the imagination; and we may be sure that the machinery by which these myriads of letters are distributed moves with perfect smoothness and ease, for any stoppage would throw the whole correspondence of the country into the most inextricable confusion. The sorting-rooms of the General Post Office on Friday evenings, before the despatch of the night mails, present a most curious sight. Hither are brought the entire correspondence of the metropolis, and of the country districts around, that has to be passed through London, and in addition hither are brought such letters as are posted in the central district for metropolitan delivery. Of these letters only those which belong to the E.C. district are delivered from the Post Office, letters for all the other nine metropolitan districts being forwarded to them in bags, each district being now considered as a post town, sorting and delivering its own correspondence, and interchanging bags one with another. This distribution of the letter-sorting and delivery has relieved the central office of most of the work it had to perform, when, in the old days of the penny post, every district letter came to the head-office for distribution; but the vast increase of the general letters for the country has made up for this diminution of work, and at five o'clock, say, on a Friday evening, the sorters are all at their posts, and the labour of arranging the letters into the various roads and districts commences. The speed with which this operation is completed is extraordinary; the long range of pigeon-holes which face every table are speedily filled, and then the letters are stamped. In order to enable the authorities to trace letters, every stamper is supplied with a fresh stamp before commencing work. This he signs for; consequently, the envelope will at any time bear witness through whose hands it has passed previously to delivery. The book and sample post sorting is carried on at the same time, and if the publishing day of the magazines should happen to fall upon a Friday, the strain upon the office is greatly increased. The size of the book packets allowed by law is extremely liberal; parcels two feet by one foot square are permitted to pass, and the number that do go through the post testify to the great labour that falls upon the postman. The penny post for the conveyance of letters and parcels about London and its suburbs was established as early as 1683 by an upholsterer named Murray, and on its first starting parcels were not limited in weight. This was a more generous arrangement than the present parcel post, but it gradually became much restricted, and one Dockwra, who afterwards conducted the undertaking, was charged with forbidding the taking of any handboxes (except very small) and all parcels above a pound; so that, in respect of the carriage of parcels, we have not made a very great advance, but then the numbers have enormously increased. The sample post, established in 1864, has been taken advantage of by merchants and tradesmen to a very large extent. In 1865 no less than 1,280,000 samples and patterns went by post. The majority of these samples consist of produce, such as tea, sugar, coffee, hops, seeds, corn, beans, etc.; but every conceivable article under the allowed weight, from mouse-traps and clock-works to leeches and Pharaoh's serpents, now passes through the Post Office. These samples are sorted on the same counters with the letters, and their bulk, of course, is far greater. Attempts are made to burden this department with very odd articles: a limb for dissection not long since was discovered by its smell, and rejected. Letters and parcels,

when sorted, are sealed up in bags and despatched by eight o'clock to the various railway termini. We must mention, however, that the sorters can never depend upon the amount of work they may have to perform, as occasionally advertisers will swamp the tables with small packets and printed enclosures. Thus, in 1859, the Sacred Harmonic Society, and the Crystal Palace Company, posted in one day at the central office 400,000 circulars, and while we were watching the process of sorting the other evening, 100,000 circulars came in as a disturbing element in the machinery of the office. There are, however, certain regular irregularities. For instance, on Friday evenings there is a vast increase of newspapers, consequent upon the despatch to the country of the weekly newspapers. On Saturday, again, there is a great increase of letters, consequent upon the Sunday closing of the Post Office. On Monday there is a like increase from the same cause. But the most striking regular irregularity occurs on the 13th and 14th of February. Some people may imagine that St. Valentine's Day is only dear to children and nurserymaids, and that the amorous gush of correspondence that occurs on the anniversary of the saint is declining in these days of enlightenment. Alas! the gush is only becoming more impetuous. In the year 1866 there passed through the London Post Offices, for town and country delivery, 897,900 valentines, and last year the number had increased to 1,199,142, giving a revenue to the Post Office of £11,242.

The sorting of newspapers is effected in a large room, ingeniously suspended by iron rods from the roof. They come on Friday nights in such overwhelming numbers that they require a special lift, or rather series of lifts, to take them to the sorting-room; when this process has been accomplished, they are placed in sacks and sent down a shoot into the vans which await them in the yard. The Government has no monopoly in the carriage of newspapers such as they possess with respect to letters; consequently, prodigious as the number of the papers is that pass through the Post Office with the impressed stamp, a still larger number go by railway in quires unstamped; and we may state that Mr. Smith, the great newspaper agent, has a sorting-van on the railways, in which he arranges newspapers for his agents and subscribers, just in the same manner as the letters are sorted in the Government railway travelling Post Offices.

Late letters, as the public is well aware, require extra stamps, according to the lateness of the hour at which they are posted. It is not so well known, however, that at all railway stations from which a travelling Post Office runs, there is a box for the receipt of letters for delivery on that particular line of rail, up to a quarter of an hour before the starting of the mail. However convenient this arrangement may be to those pressed for time, it does not appear to be taken advantage of, if we may judge from the contents of the letter-box at the Great Western terminus, in which the average number of letters is nine, and the largest number never exceeds twenty daily. Possibly the public do not avail themselves of this arrangement, because they are not aware of its existence.

The Travelling Post Office, the most ingenious of all the arrangements of the department, is established for the sorting of all the late letters which could not be sorted in time, and for the sorting of letters received while travelling along the line. It is simply a van fitted up with pigeon-holes and counters, where, while the train is hurrying at express speed through the dark night, the sorters are hard at work arranging the letters

for delivery at the different Post Office district stations down the line. The travelling Post Office stops at long intervals, but it delivers and takes in the mail-bags when going at full speed, by a special apparatus devised by one of the *employés* of the central office. By the side of the travelling Post Office there is suspended a netting, looking very like a hammock-netting, with an opening towards the head of the carriage, and closed at the other end. The bags to be received are hung on the near side of the rail, suspended from an iron standard, and they are swept into the bag by a V shaped catch, just sufficiently strong to do its work, but sufficiently weak to give way rather than destroy anything if it should get in any way entangled. The mail bags fall with a loud thud into the netting, whence they are immediately taken, and the letters they contain are sorted—some of them, possibly, for a postal district lower down the line. The transfer from the travelling Post Office to the station is made in the same manner as from the station to the travelling Post Office. On two occasions the letter bags, while suspended from the standards, have been stolen, and the contents rifled, and on one occasion two of the registered letters were abstracted. Registered letters are always sent by themselves in a green bag. Every step of their progress is registered by the endorsement of the person through whose hands they may pass, and such is the security the public place in this method of transmitting money and articles of value, that the number has increased from 1,965,000 in 1863, and 2,130,000 in 1864, to 2,232,000 in 1865, the last return that has been published. This increase was no doubt largely due to the regulation by which unregistered letters, unquestionably containing coin, were, in 1861, charged with a double registration fee, to be paid by the addressee. The effect of this measure was to lessen the applications for missing letters containing coin, from 6,000 to 2,000 per annum. Nevertheless, the tendency of a certain class of people to break the wisest regulations in spirit, if not in fact, is evidenced by the increase of letters containing postage stamps. Senders of money in this form possibly believe that by so doing they are not throwing any temptation in the way of the postmen, but we are assured, by those versed in the matter at the Post Office, that postage stamps, if not felt through the envelope, can be smelt.

While every care has been given towards the collection and rapid conveyance of letters by the Government, the public has not assisted the department as much as it might have done. Possibly the Board of Works are mainly at fault in one particular—the want of care in properly naming and numbering the streets. Builders have created unnecessary difficulties for the postman, by the absurd repetition of the word Westbourne, for instance, which is applied to streets, groves, terraces, etc., in the western district. The nomenclature of streets is especially worthy of the supervision of the Board. There are fifty King Streets, as many Queen Streets, sixty John Streets, sixty William Streets, and upwards of forty New Streets. Again, the irregular numbering of streets is a great cause of delay in delivering the letters. In some cases the four corner houses are sometimes called No. 1. Indeed, in some of the new streets there is no sequence at all in the numbers. The inspector of letter-carriers gives a very singular case in point. He says:—"On arriving at a house in the middle of a street, I observed a brass number—95—on the door, the houses on each side being numbered respectively 14 and 16. A woman came to the door, when I requested to be informed why 95 should appear between 14 and 16; she said it was the number of a house she formerly lived at

in another street, and it (meaning the brass plate) being a very good one, she thought it would do for her present residence as well as any other!"

The returned letter office, which is one of the most singular and interesting departments of the General Post Office, is situate in St. Martin's-le-Grand Street, opposite the great building. To this department gravitate all the letters that fail to be delivered throughout the empire. It will astonish the reader, perhaps, when he is told that this number amounted in the year 1865, to 3,518,000, equal in quantity to the entire annual correspondence of many a German kingdom. Of course, we do not mean to say that the entire number failed to reach their destination eventually, or that they were all *bond fide* epistles; many were circulars, having reference to the general election of that year, many advertising circulars, but the larger proportion were genuine letters. The reasons that led to this large return of correspondence are numerous and singular. It will, perhaps, scarcely be credited, that in 1865, 12,000 letters were posted in Great Britain without any address, and these letters contained valuables in the form of checks, notes, and money to the amount of £3,700. On one occasion, £5,000 in notes were sent, improperly addressed, open at the ends, like a book packet. Not long since, the "blind men," of this department, as the decipherers of illegible and imperfect addresses are termed, were fairly beaten by the Arcadian simplicity of the following superscription on a genuine letter, containing a pair of spectacles:—

"My dear Father in Yorkshire, at the white cottage with green pailings."

It had evidently been written by a servant who, having a fond recollection of the paternal home, thought everybody in Yorkshire must be equally acquainted with it. Bad writing and spelling are a fruitful cause of failure in the delivery of letters. Some years since a letter came thus addressed:—

"Mr. Owl O'Neil,

At the Post-office."

The "blind man" into whose hands it fell, surmised at once that this was a bit of phonetic spelling, and delivered it without hesitation to Sir Rowland Hill, its rightful owner.

Every letter, after remaining in the office for a certain time, to give persons an opportunity of claiming it, is opened, and, if possible, sent back to the writer. Nevertheless, there are a large number that are destroyed. The official reasons given for non-delivery to the persons addressed, are as follows:—One per cent. are dead, three per cent. are not called for at post-offices, five per cent. are refused, five per cent. are illegibly addressed, twenty-one per cent. are addressed to persons who have gone away, and forty-five per cent. are not known as addressed. About three-fourths of these undelivered letters are returned to the senders. Out of the 600,000,000 letters posted per annum, only 3,000,000 fail to be delivered, in other words, not more than one in two hundred letters fail, or one-half per cent.

All returned letters containing articles of value, lapsed post-office money-orders, and books, are kept for two years, and, if still unclaimed, are sold at Debenham and Storr's, and the proceeds are carried to the credit of the Life Insurance Office in connexion with the Post Office, the sum being added to the extent of five per cent. on premiums of those insured.

Newspapers that fail to be delivered, in consequence of the wrappers coming off, or returned from the fact of not being stamped, or insufficiently stamped, etc., find their way to this office in large quantities. It is just possible that the department was until very lately charge-

able with the miscarriage of many of these, inasmuch as the postage-stamps were so thinly covered with gum that they fell off; 1,200,000 got loose in the Post Office in 1865. In the next year this was remedied by a thicker coating of the adhering material, and the number of loose stamps fell to 760,000. Possibly, if people would not lick stamps, but wet them, there would be still fewer failures of both letters and newspapers from this cause. The detained newspapers amount to five sacks a week. They are all torn up, and are sold for waste paper. While witnessing this destruction, we could not help thinking that a few of them would be well distributed if sent to our poor-houses and other charitable institutions, where the poor inmates have so little to cheer them in their often enforced idleness. We recommend this idea to the Post Office authorities.

We cannot, within the limits of this article, do more than refer to the many new departments which have, of late years, been created and placed under the government of the Post Office. The Money-order Office has grown enormously, and has, in fact, superseded to a very large extent the system of bank draughts. The Savings Bank, with ramifications throughout the country, and with a receiving-house in the large percentage of its Post Offices, has become a large establishment in itself, and is every year increasing; the Government Insurances and Annuities Office—all these establishments, which may be considered satellites to the General Post Office, will grow with the growth of the country. At present they are scattered in various buildings, but it is

the intention to concentrate them in one large building to be erected, as soon as all the leases have been obtained, on the site in St. Martin's-le-Grand, opposite the Post Office, extending from Newgate Street to the Bull and Mouth. This building will, in course of time, no doubt, surpass in size the General Post Office, and the whole system, under the direction of the Postmaster-General, will probably represent the most powerful, as it is the most profitable, of all the Civil Service departments of the State.

The revenue of the Post Office, from all sources, has year by year been increasing. The last return published, refers to the year 1865, when the net revenue amounted to £1,482,522. According to the annual increase, that amount cannot now be much under two millions, which is paid into the Exchequer without any deductions. Lord Stanley of Alderley, the late Postmaster-General, clearly anticipated that in a few years it would, without in any way stinting the service, produce an income nearly equal in amount to the income-tax. Such being the case, it will become a question for the consideration of the Government, what we shall do with it. It has been often asserted that the Post Office ought not to be a source of revenue; possibly not; but we cannot help agreeing with his lordship "that it would be difficult if not impossible, to devise any mode of raising a public income less burdensome or more equitable in its operation, than that which exacts no payment without giving a service in return, and which is not open to the appellation of a tax."

TWO MONTHS IN SPAIN.

BY THE AUTHOR OF "A MERCHANT'S HOLIDAY."

SAN SEBASTIAN.

ALTHOUGH an old traveller in many parts of the world, I had never visited Spain. Vague ideas of troubles and discomforts had hitherto deterred me. But the railways, if they have destroyed the romance, have removed most of the difficulties of travelling, and, armed

with Bradshaw's Guide, and Murray's Handbook, I felt sure that the chief routes in the Peninsula must be easily accessible. Accordingly, I resolved on the expedition, a brief record of which may serve as a guide to other travellers.

I may say at once, that if the reader expects any perilous adventures among contrabandists or banditti, he will be disappointed. Travelling in Spain is as easy in

were included guides in the various cities, photographic views and other *souvenirs*, and all incidental expenses. On a more economical scale, and with sufficient comfort,

PLAIN OF VITTORIA.

the present day as on any part of the "grand tour of Europe;" and as to cost, while the railway fares are | the same tour of two months could be managed at an outlay of little more than £40. I took with me circular

BURGOS.

higher than in France and Germany, I found that my expenses, including first-class travelling and hotel accommodation, did not exceed a pound a day. In this | notes of the Union Bank of London, a safe and convenient "circulating medium," as they can be cashed in any city of Spain without loss or trouble.

There is no passport now required from the British traveller in Spain; but, if he has an old one of any date by him, it may be as well to put it in his pocket, as it may be asked for at the post-office, when applying for letters "poste restante." But, in the absence of any such document, it will be quite sufficient to show the letter of indication which he receives with the circular notes, and which bears his signature. In every case, except one to which I shall hereafter refer, I found the presentation of my card quite sufficient for all purposes.

I would advise the tourist to carry the least possible amount of luggage, which will save much trouble and expense; and, having nothing that is subject to duty, a simple declaration to that effect will generally satisfy the Custom House authorities. One of the articles of which they are most suspicious is tobacco; and I would advise the traveller who smokes to trust to Spain for his supplies.

On the 2nd November last I left Paris by the express train at 10.30 A.M., and arrived at Bordeaux at 9.30 P.M., the distance being about 360 miles.

I am not one of those who "travel from Dan to Beersheba, and say that all is barren;" but certainly there is no picturesque scenery on this journey. The country may be called flat, fair, and fertile; for every foot of ground is well cultivated. The journey is not without interest, as we pass the old historical cities of Orleans, Tours, Poitiers, and Angoulême; and if we do not see much of these cities by the present go-ahead mode of travelling, the fact of passing them prompts us to read up some of our forgotten history. Bordeaux itself is worth the journey, and is among the finest maritime towns in Europe, with broad boulevards, large squares and gardens, and a palatial style of building, in a semicircle of three miles, along the left bank of the river Garonne. The river is navigable for vessels drawing twenty-two feet. There are no docks. A great number of vessels were lying in the river, of which three or four of the largest were for Calcutta and Bombay, and, strange to say, they were taking freight from England to India, paying all charges, at ten shillings a ton less than from London and the Clyde. Here is a problem for some of our ship-owners to solve. Twenty years ago I happened to be a passenger on board a French vessel from Calcutta to Bordeaux. The commander, Captain Ireland, was a thorough sailor and a gentleman—a Frenchman by birth and education, and an Englishman in feelings and sympathy. I had not been long at my hotel when I learned that he was settled here as a merchant, and I called upon him. We had not met for twenty-six years; both had become grey, and these long years had told greatly on both of us; but, strange to say, we recognised each other at once by the voice, and I had a most kind and welcome reception, and was introduced to the club reading-room, and all that was interesting in the city.

After spending two days here very agreeably, I started at eight A.M. for Bayonne and Biarritz, and arrived at the former city at noon. A number of our passengers left us at the station of Dax, *en route* to Pau, where they proposed passing the winter, some of whom I afterwards met in the south of Spain, congratulating themselves that they had not remained "under the Pyrenees." Biarritz is only five miles distant from Bayonne, and there is constant omnibus communication; so that, instead of going on at once by rail to the pleasant and favourite retreat of the Empress of the French, I stopped four hours at the latter city, and had time to look around the citadel, and stroll about the quays and harbour, which lay within sight of the Bay of

Biscay. Then I took the outside of the omnibus, and arrived at Biarritz at 5 P.M. Nothing could surpass the beauty of this evening. Far out on the Bay of Biscay, which was calm as a mill-pond, the golden sun was sinking in all its glorious majesty; the temperature was as mild as our evenings in June, and when a nearly full moon "took up the wondrous tale," I could scarcely reconcile myself to come within doors. Next morning I visited the Villa Eugénie, which is furnished with great taste, and all around looks cleanly and cheerful. Several English and American families talked of passing part of the winter here, from which I would rather be excused, unless I wished to retire for private meditation.

Next day at noon commenced what I may call my Spanish journey. An hour and a half after leaving the station of Biarritz we come to the frontier town of Irun, where luggage, not registered for Madrid, is examined with very little trouble. If you have only one package, a shake of the head and "nada" will meet with a smile and exemption from being searched. I retract the "smile," and call it a complacent look, for I have not yet seen a Spaniard smile, and I begin to doubt if such a thing is possible. Much has been said and written about the drowsy indifference of the Spaniard, and here we first begin to see its effects, which increase as you go on; but I shall have occasion to refer to this hereafter.

The next station we pass is San Sebastian, where we remained long enough to take a sad look at the rugged cone where stands the citadel, about four hundred feet above the sea, and overlooking the town, which is built on the isthmus lying along the seaboard, and nearly isolated from the main land. No Englishman can pass this spot without mingled feelings of pride and sorrow. The readers of Napier's "Peninsular War" will remember how desperately the French maintained their last position here, and with what dash and daring the British soldier advanced from trench to trench, and foot by foot, until its final overthrow, amidst blood and carnage such as we of the present day shudder to contemplate. Among the survivors of that awful 31st of August, 1813, was the gallant "young Campbell," afterwards Lord Clyde, who gained his first laurels at this eventful siege.

I arrived at Vittoria at 7.30 P.M., and there I remained all the next day to see the battlefield, and the points of interest described by Napier. From the tower of Santa Maria I had a complete view of the position of both armies during the heat of the battle, and of the eight or ten villages from which one after the other the French were driven, and where King Joseph and his army suffered such disasters. It must have been hot work on that summer day of June, 1813. I have my own opinion on these sanguinary interventions and the millstone they have tied round our necks; but there can be but one opinion among Britons of the wisdom and sagacity of our great Captain, and the valour of our troops, so many of whom were left behind to dust and desecration, while England was contemned by a boastful and ungrateful ally.

The town itself is but another type of Spanish retrogression—dull and dilapidated. The only moving activity seems to be about the dinner-hour. At five P.M. some military officers and town officials, and a few employés of government, entered the *comedero*, or *salle à manger*, each with a cigarette in his mouth, and, divesting themselves of their large cloaks, sat down at table, evidently to enjoy themselves; and with that easy volubility of language which seems to flow like a smooth rapid stream from the lips of a Spaniard, the conver-

sation never seemed to flag. One wonders how, in the absence of political and religious controversies, they can find twaddle for their lengthened harangues. The dinner occupied more than an hour; and I refer to it more particularly, as it was the first characteristic Spanish *table d'hôte* that I had been at, and where I first saw the cigarette introduced at dinner. I have said that they all came in with one in their mouths, which they threw on the floor when they sat down, and after soup they lighted another; and so on, after each course, the smoke was renewed, till the cloth was removed and the appetites satisfied.

The next morning I took a guide, and was first introduced on the scene of the Spanish Alamedas. Whatever stagnation there may be about a place, they still keep up these charming promenades, and the Florida and Prado outside this town, with their shady avenues of trees and broad walks, form delightful lounges. The spacious and well-supplied markets are another characteristic of Spain.

The next day I came on to Burgos, the capital of Old Castile. The Cathedral is the great attraction here, and is certainly a fine specimen of the florid Gothic of the thirteenth century. The rough and neglected exterior does not at first impress you with beauty; but after wandering through its aisles, and under its lofty Gothic arches, and ascending the main tower, and looking down upon its beautiful architecture and elaborate ornamentations and vast proportions, I am inclined to rank it among the very finest specimens of the florid Gothic of the fourteenth century. The figures and carving that ornament the beautiful towers that spring from the arches, and that have stood the storms of six centuries, are as sharp and defined as if they had just come from the hands of the workmen.

The interior has lost much of its former wealth and art, but it is still rich in architecture and in painted windows and altar ornaments. The wood carvings in the choir and round the stalls are wonderful specimens of labour and art. The French made sad havoc here, and robbed the cathedral of much of its silver ornaments and works of art. One of the principal chapels is dedicated to the patron Santiago, or St. James, "who planted the first church in Spain, and was its bishop!" The Spaniard has, no doubt, as much authority for his saint as the Roman has for St. Peter; and when I expressed to my guide some surprise that I had never heard or read that "James, the brother of John," who was stationed at Jerusalem, and suffered martyrdom there, had ever been so far as Spain, my devout friend knew nothing about the Gospels or "Acts of the Apostles;" the Church knew best, and he was bound to believe it. The grandest of all these chapels, and large enough to form a church of itself, is that of the Constables of Castile—a perfect study of beautiful white stone carving and floral ornament.

I stopped longer than I had intended at this interesting old city, as I was anxious to ramble over that barren hill and dilapidated old castle, before which we lost more than two thousand men, and after five different assaults and thirty days' fighting had to retire and leave the French in possession. There has been little change for these fifty-four years; the old broken wall, the ruins of the church, and the exploded mines are there, with a sentry pacing among the crumbling ruins. I took a conveyance, and drove two and a half miles to the Carthusian Convent of Santa Maria. The chapel is still a perfect gem, but the abodes of those friars and monks who lived on the fat of the land are now silent as the tombs to which they have passed.

Proceeding from Burgos to Valladolid, the old capital of Spain, I found interest enough to remain a part of two days. At the hotel there was a melancholy Swiss waiter, and a sort of *valet de place*, who spoke French and acted as my guide. Poor fellow! it was amusing to see the mixture of Spanish melancholy and Swiss vivacity; now wiping the glasses and plates, and brightening up with our references to his beautiful native lakes and mountains; again addressed by some sombre señor, in Spanish, every muscle of the face settles down to its proper gravity, and he becomes a native of his adopted country. This man was from a Catholic canton, and may be undergoing some penance, which I hope he may not sink under. I found him very useful: he had the usual Swiss intelligence, and I daresay knew more of the history of the city than half the natives. We visited every place of interest: first, the house in which Columbus died, now a miserable woollen shop; the University, the principal one in Spain for legal study, with upwards of 1,000 students; the Museum, which is more curious than instructive, and may be called the tomb of sacerdotal trumpery—a gathering of the wreck of the French ravages, and the confiscated monasteries and convents. The Cathedral is a fine massive building, of the Corinthian order, but unfinished, and, like all Spanish churches that I have seen, bare and dilapidated. The Queen has a royal palace here, of plain exterior, but this was not open for visitors. The great Inquisition still stands here in ruins—that abomination of all abominations. The first Napoleon made a complete clearance here; but if he had never done anything worse in his unscrupulous career than turning this pandemonium into barracks, stables, and military storehouses, he would have much less to answer for. The great church through which the anathemas rang against the new heresy is now a tottering ruin, and there is not a whole pane of glass throughout the building—a true emblem of the past and present Spain.

I left Valladolid at 9.30 P.M. by train, and although the distance to Escorial is only about 120 miles, we were nearly eight hours on the journey, and the heat of the day made us feel the rather cold, frosty night more severely. We arrived at 6 A.M. It was just daylight: there was no conveyance in attendance, nor, in fact, any one to take charge of our luggage. There were the usual two or three muffled statues, even at this early hour, with their cloaks round their mouths and over their shoulders, smoking their cigarettes; but these dignified persons were not porters; they were not looking after any one either coming or going away; they were simply looking at vacancy. A passenger, seeing me anxious about my "equipage," directed me to accompany him up the hill, of three-quarters of a mile, and to give my *receta* to the servant of the hotel, who would come down for my portmanteau. I may here mention that the plan adopted on the Spanish railways for the care of luggage, though somewhat tedious, is admirably adapted for safety. There is no value put on time. You are expected to be at the station half-an-hour before the train starts, and if the train is half-an-hour late, you have ample time to take out your ticket, and have your luggage entered, for which they give you a number and receipt; for over-weight, the charge is rather high. When you arrive at your destination, you must not lose your temper if you are kept another half-hour. "Is not the luggage of the coming passengers to be put in, and that of those stopping to be taken out, and all carefully arranged on a table before the doors are thrown open; and do you expect this to be done in a hurry? Señor Inglis is a little impatient, but there is plenty of time."

I came to Spain to learn, and I took my lessons coolly.

The Fonda Miranda is a type of all the provincial hotels in Spain that I have seen. When I describe anything to English readers, I endeavour to make some comparison that will bring the object to the mind's eye; but there is nothing in Great Britain or anywhere else that I know of to which I can compare the Spanish Fonda. The total neglect of all those little domestic comforts and cleanly habits to which we are accustomed in England is almost revolting. You will imagine me cold and tired, arrived at a closed and barred door, at seven o'clock in the morning. After knocking for some time, the master or his representative comes half-dressed, seeming to wonder why you have disturbed him. On explaining that you want a bed-chamber, he makes no reply, but takes down a key, and you follow him up a rickety wooden stair with broken balustrades, till you come to a long dark passage; and finally a thick clumsy door is opened, which emits a little light, and you are ushered into a matted room, very much like those cells for prisoners on the silent system. Here you are left, water and towel are brought, and you have plenty of time to contemplate your new prison, with the little iron bedstead, the dirty-looking rug, the small hand-basin in the iron stand, and the rickety old chest of drawers: even the old clock, that never goes, of French bed-rooms, is absent. This is the Windsor of Madrid, and this is the accommodation afforded by the best hotel in the place. After making my ablutions in the smallest of soup bowls, and getting an egg and a cup of black coffee, I sallied forth to explore the wonders of the far-famed Escorial.

The first sight of the Escorial is disappointing, particularly if the imagination has been wrought up to a high pitch by flowing description. I may begin by giving some idea of the dimensions of the building. It is nearly in the form of a quadrangle, and for convenience sake we will take each of the four sides at 750 feet. It is said to represent a gridiron, being so built after the legendary mode of the death of St. Lawrence, to whose honour the place was dedicated in a vow by Philip II; hence it is properly called San Lorenzo el Real—the four turrets at the corners forming the inverted feet, and the Royal apartments the handle of the gridiron. It stands about 2,500 feet above the level of the sea, in the bosom of a semicircle of rugged barren hills, and the whole surrounding scenery at this season presents a very desolate appearance. When you have gone round the exterior of the building, you can come to no other conclusion than that it is a gaol, a reformatory, or penitentiary. There are said to be 11,000 windows, more or less, in the building; there are five rows of these, and the two lower are iron-barred, still carrying out the idea of a gaol: the windows are simply holes in the wall, five by three feet, without any attempt at ornament. The exterior is built of a fine light-brown stone, as fresh as when it came from the hands of the mason. There are no grand porticoes or ornaments to arrest the eye: everything is in keeping, of the simplest and purest Doric. The interior is composed of massive blocks of grey granite: the pillars, arches, and roof seem to be hewn out of the solid granite rock. I have never seen anything in which strength, solidity, and simplicity were so happily combined. We were shown round the apartments by a guide, who spoke Spanish and French alternately; but the sight is scarcely worth the labour. The walls are hung with Flemish and

Spanish tapestry, with a great deal of very pretty marqueterie round the panneling of the walls. We were shown the small and solitary apartments of its bigoted founder, Philip II, where he held counsel with his priests and confessors. From these apartments a passage led into the church. I have spent days in St. Peter's, in Rome, and could return again and again to its artistic details; but here you have merely the grandest mass of unadorned granite, wrought into classic form of the simplest order. The eye has nothing specially to rest upon, unless it may be the frescoed roof of the choir, which stands some forty feet above the nave, and is on the opposite side of the altar. If it is a complaint that St. Peter's is too ornamental for devotional purposes, this building is free at least from this fault. Certainly its founder had a noble conception of what a great temple, devoted to the living God, ought to be; for here there is nothing but magnitude and space to divert the attention from the solemn and impressive service.

The ground plan of the palace is composed of some fifty courts—in fact, carrying out the idea of the bars or meshes of the gridiron; and in most of these are fountains of water playing. I spent the whole day wandering through these courts and apartments, and the only impression left on my mind is, that this vast building, which cost fifteen millions sterling, and, like Versailles, laid the foundation of national bankruptcy, is now only and admirably adapted for a penitentiary.

I had almost forgotten the Pantheon, or royal tombs of the kings and queens of Spain, immediately under the great altar. The guide supplied us with lights, and we were led down a stair, under a sloping arch lined with fine coloured marble. At the bottom of this stair is an octagon vault, of some forty feet in height and diameter, and round the building are the marble coffins, or sarcophagi, of the kings and queens of Spain, from the father of the founder down to perhaps the last of the Bourbons; and there are still a number of empty coffins waiting to receive the ashes of majesty.

The whole building originally consisted of a palace, a convent, and a tomb, and was a sort of earthly paradise from which the holy Philip might make his apotheosis. The church, with its beautiful dome, and the library, with its arched fresco roof and marble pavement, and the marble and porphyry reading-tables, which are never used, and the massive book-cases, which are never opened, are the chief attractions of the building. The guide had a long story about the number of fountains, cloisters, stair-cases, court-yards, etc., but somehow or other it was all lost upon us, and it was a happy relief to get out into the open air.

On two sides of the building are a succession of fine broad terraces, bordered with box and other evergreens, and sparkling fountains; and on the southern declivity, an extensive garden and park, which at this season looked neglected and out of order, but was finely wooded with elms, fruit-trees, vines, and olives.

A CASE OF DOUBLE VISION.

WITH the conviction that the facts I am going to record are calculated to be of use to all business men, and to literary men especially, to whom the preservation of good sight is of vital importance, I shall sketch as briefly as I can the phenomena of a sufficiently distressing experience. I ought to premise that from infancy the lachrymal duct of the left eye has been closed; but

the closure never affected the sight for a period of more than forty years, during the whole of which time I could see with remarkable clearness, and to a great distance.

In the year 1854 I was induced to undertake a certain amount of literary work, which, once entered on, could not be given up until the year had expired—although I had at the same time regular employment for ten hours a day. The writing had to be done in the evenings, by the light of candles. For a time all went on comfortably enough; but before the expiration of the third month, the sight began to be at times misty and disturbed. Then the disturbance grew worse. I could not discern the point of the pen as I wrote, or I could not see the word I was writing, while those just written were perfectly distinct. At other times I could not see the line that was being written, only those above it; and again, sometimes, what I can only describe as a *bar of nothing*, some three or four inches in length, and half as much in breadth, would accompany my pen as it moved along, effectually veiling its motions from myself. I could at first get rid of these hindrances, and of the frontal headache which accompanied them, by bathing the eyes, forehead, and temples in cold water; but, as time went on, I had to use more stringent measures, such as turning the tap of the cistern on to the crown and back of the head, until the parts felt quite numbed. Even these means would not avail for long, and eventually I had to set to work of an evening with a wet towel bound round the head; and this practice I was compelled to have recourse to until the colder weather of autumn and the approach of winter enabled me to discontinue it.

When the year's overwork was done, the symptoms above described abated, and in the course of a few months seemed to have vanished altogether. It was not exactly so, however; as upon occasions I was made unpleasantly aware of the possibility of their recurrence. With years I had learned experience, and was now quite willing to be more economical of the visual power. On the *venienti occurrere morbo* principle, I now kept watch against the first indications of disturbance, and by continual care was enabled to stave them off. I worked less, and took more recreation and more frequent change of air; and when I did work, I did not tax my sight so much or so long together as it had been my custom to do. In consequence of my watchfulness, perhaps, the bad symptoms did not recur for several years, and at length I lost all apprehension of their recurring at all.

But in 1861 I became low in health, suffering most dreary depression in the fore part of the day, sometimes, but not always, compensated by extra vivaciousness and hilarious feeling towards evening. Now it was that the visual disturbances returned, not only in their old forms, but in others quite new to me, and as disagreeable as they were new; while their visitations were so frequent as to be quite a nuisance, often preventing me from work for hours together. The old plagues, which I fancied I had got rid of, returned in all their force and variety, and now they harassed me, not only when at work but at other times. The new phenomena were even more alarming. Sometimes, when sitting at my desk, or at meals, I would see but half of any object before me—the blade of a knife, or the bowl of a spoon without the handle, the feet of the servant and her figure up to the waist, as she seemed to wait at table without her head; or the shaggy head of the house-dog as he went to and fro without his hind quarters. Such broken visions were, however, never in my case more than momentary; I could in an instant, by an effort—

and I always made the effort—bring the whole of the divided object into view; and the fact that I could do so was a great relief to my mind.

Now and then, when looking at two objects, I saw but one of them, or, if I saw both, the outlines of both would be blurred, as if interfering with each other. This defect I could not so readily correct, though I could do so by rubbing or bathing the eyes. Again, it would happen that while I was busily at work, a chance look at the floor would show me the carpet apparently raised a foot or more above its actual position, nearly to the level of the chair-bottoms; it would never stay in this position, but would sink down again slowly and steadily as I looked at it. Or if I looked at the wall of my room, I would see it nearer to me than it really was, and that by a full half of the distance; at the same time the pictures which hung against the wall seemed to be partly sunk in the wall, their images not coming nearly so far forward as the wall itself. If, while thus looking at the wall, I happened to glance to the right or the left, it seemed that the pictures and wall-paper moved also to the right or left, their images falling in a confused manner on the objects occupying the new field of view, but fading quickly out of sight, disappearing in two or three seconds at most. I found that the best remedy for these unwelcome visitations was a run into the country for a day or two, and a temporary cessation from working and thinking; but the cure was now much less certain, and more slowly effected than it used to be.

By this time the long sight, the power of distinguishing objects at a distance, which I had once possessed in so remarkable a degree, had gradually changed to its opposite, and I had become near-sighted. For years past I had been using a concave lens for looking at distant objects, and was quite incapable of defining them without its aid. Still I used no spectacles, not feeling the least need of them, but reading the smallest print with perfect ease.

I pass over some subsequent experiences, which would be interesting if I could describe them accurately, and hasten on to the event which has been the cause of my writing this paper.

On a day in the second week of June, 1867, I had been writing sedulously from breakfast time to near sunset, when I became suddenly aware of the return of some of the unwelcome symptoms described above. At first I saw here and there a single letter only in each written word as it was formed; after a few minutes I ceased to see any part of the word until it was completed; in a few minutes more I could not see the line that was being written, although the lines above it were clearly visible. Anxious to complete the article in hand, to which, indeed, I stood pledged, I persevered in my work, with the determination to get it done before the darkness came on. I had almost finished when that strange visitant which I have before described as a "bar of nothing" came and interposed itself between my eyes and the work of my hand. But, having only a few lines more to do, I wrote on, even in spite of this, and completed my task, having little doubt but that the long evening walk I intended to take, followed by a night's rest, would tranquillise the optic nerves and set me right again. It was just past sunset when I left the house, and walked down the terrace to deposit my paper in the post-office. I had taken but a few steps, and was looking at an advancing figure which I thought I knew. When, to my astonishment and alarm, I saw another figure the exact counterpart of the first, save that it seemed twice as big, walking in the air at the height of some twenty feet. I soon saw, however, that the ap-

parent increase in size of the upper figure was but a delusion consequent on its greater distance; for, as both figures approached, the upper one drew nearer to the lower without diminishing in stature, and yet coalesced with it, though not at all perfectly, the two together presenting a blurred image of a gentleman with two heads, one over the other; and under that grotesque appearance it passed me. If this odd vision had come without any of my previous experiences, my alarm had been doubtless great; but the familiarity that breeds contempt had in a measure prepared me for it. I knew at once that my sight was at fault, and I began to test it immediately with other objects. Looking at an omnibus swarming with outsiders, as it passed along the road, I saw its double running along in the air above, the two images separating farther and farther apart as they receded in the distance. I saw that every figure on the opposite side of the street was doubled in the same way, and subject to the same changes; that the houses were twice as high as they should be, some of them showing six storeys instead of three. At first I imagined that the doubling of objects was confined within certain limits of distance, because on reaching the fields I found that a tree-covered hill, distant near a mile, showed without its double; but this was a mistake too, soon dissipated by the appearance of the distant hill far up in the sky, where I had not thought of looking for it. I walked farther through the suburbs towards the country, in the hope of shaking off the visual incubus, which much annoyed and bewildered me. But the symptoms grew worse instead of better as evening wore on. I detected myself in wandering out of the straight line as I walked, like one intoxicated, and I knew that this happened because I was constantly mistaking the doubles of objects for the objects themselves. When I looked at the pavements I saw double lines of flagstones overlapping each other and mingling together, and I saw my own legs and feet doubled at every step. As the lamps were lighted in the long suburban roads, they became confused in an indescribable manner—a chaos of red lights in the foreground, and streaming upwards like the tail of a rocket in the distance; and when the stars shone out it was in vain that I endeavoured to recognise the most familiar constellations.

I came home early and went to bed, with a hope, almost amounting to assurance, that a good night's sleep, for which I felt more than ordinarily disposed, would prove a perfect restorative, and that morning would find me all right and ready to resume work. No such thing. I slept soundly and long; but in the morning the first thing I saw was the vision of four windows instead of two in my bed-room, and double images of everything around me; even—what I had not noticed before—my hands and fingers were doubled; the double vision seemed confirmed, though the slight haziness which had accompanied it the night before had disappeared, and all objects were now clear and distinct in their double existence. As I lay in bed that morning, I began to study the business a little, with a view if possible of getting at the *rationale* of it; but I could not make much of it then, being probably too much interested to weigh and compare the phenomena as I might have done had the case been another person's. But I learned something. I found that all objects directly in front of me were fairly doubled; if large and near, the two images overlapped each other to an extent proportioned to their size and nearness; if small or distant, the two images stood perfectly distinct from each other, and on the same plane. But objects not in front of me were displayed in a different manner. Thus, on looking at the pictures on

the walls, I found that those on the right-hand wall, though doubled as distinctly as objects in front, had not their images on the same plane; the lower images stood in their right place, but the upper ones were farther off, rose high as they receded, and converged downwards in a diagonal line as they were nearer; and I could see that this diagonal would not touch the perspective line of the lower image until it had reached a point considerably in the rear of the spot where I lay. I was not prepared to discern, as I did on looking at the objects which hung on the wall to the left, that on that side the visual disturbance was much less than it was in any other direction; the objects, it is true, were doubled, but the doubling amounted to little more than a blurring of the outline, unless the objects were very small indeed, in which case I could see them distinctly side by side.

At this stage of the business there was nothing else for it but to go to my medical man, and I paid him a visit accordingly. He did not give me much medicine, but treated me for a short time with mercurial laxatives and aperients in small doses; knowing my constitution well, he was chary of strong measures, and advised a cessation from work, a prolonged holiday, with change of air and scene.

Accepting his advice, I started on the following day to pay a visit long due to some friends in the country, trusting that the change of air would prove beneficial. Nor was I altogether disappointed. Spending most of my time out of doors, I gained strength from day to day, and after a time found that my disordered vision was assuming a new phase, considerably less severe and trying. After a few days the doubling of objects began to confine itself to a certain angle of vision. When I looked upwards all was right; there was no appearance of doubling in the clouds by day, or in the stars by night; though at all angles between ten or twelve degrees above the horizon, and all below that, the doubling remained as before. This improvement was gradual, and not regularly progressive—the angle of disturbance widening and narrowing, and being generally narrower in the morning than at night—the disease in a manner oscillating from bad to better and *vice versa*, though on the whole the improvement was marked. I found, further, at this time, that by a powerful effort I could get rid of the doubling of the flag-stones beneath my feet, although I could only do that for a few moments at a time, the effort being too painful for lengthened endurance. I had also learned ere this to mitigate the giddiness and bewilderment which so much distressed me by closing one eye as I walked about—as, so long as I used but one eye, I saw, of course, but a single image of objects. I had more than a suspicion, however, that this was not the way to hasten my cure, and therefore I resorted to it only for the sake of ease and rest. For the most part I could manage, when sitting within doors, to see objects singly, even with both eyes, by simply placing the objects outside of the angle of disturbance, which I could do by sitting with my face inclined downwards, and thus looking up at them. This method answered extremely well; so much so that I could sometimes fancy that there was nothing wrong—the smiling faces around the table all appearing in perfect single distinctness; but I was soon undeceived if for a moment I raised my face to the level of theirs; then the whole family appeared with two heads apiece, one elevated about a foot above the other. Some days were more favourable than others. When I drove out for a ride, the air and the rapid motion through it produced an excellent effect, and at such times I always noticed that the two images were nearer together; on the other

hand, when I had fatigued myself with too much walking, the double images would appear farther apart. My worst days occurred in the hottest weather, and were generally saddened more or less by severe pain in the forehead and temples, and a distressing sense of pressure at the back of the eye-balls.

Towards the end of June I ran down into Somersetshire, to the neighbourhood of Clifton. There I spent the whole of the month of July, strolling about the fields, or wandering under the shady, leafy avenues. I had plenty of time now to study the phenomena that plagued me, and their effects upon myself. What in a manner surprised me, as it recurred to me again and again, was the fact that, though I have usually been eager and anxious to be doing, and always detesting even the idea of inaction and profitless idleness, I had now no such feeling, but was perfectly content to do nothing at all and let things take their course. Instead of wanting to do the work which was waiting to be done, I rather wanted to sleep, and indeed could have slept almost at any time. I attributed this state of feeling to the sympathy of the brain with the visual nerves, and the influence of their perverted action upon it. Of course I kept a constant watch upon my enemy the double, while I nourished the determination to get the better of him. I was still aware that the visual angle to which the doubling of objects was confined was growing narrower, although but very slowly; and I had learned by this time that this vicious angle was at the narrowest when my digestion was in order and my general health at its best. I had found out also, that whatever might have been the fact at the beginning, the fact now was that the right eye was perfectly well and healthy, and the fault lay with the left one, which had not the power to bring down the image it received, so that it might be superimposed and blended with that received by the right eye.

At this stage of my disorder I was often the subject of optical delusions which would have been quite inexplicable to any other person. Thus, I would see a horse going up a hill, appearing quite right until he got within my angle of disturbance; then he would suddenly become endowed with two heads, and a moment after gallop off on eight legs. When attending divine service on Sunday, I could manage to see the preacher singly, by choosing my position so as to get him out of the vicious angle, though a certain portion of the congregation would always appear confused and crowded by the doubling. The reader may easily imagine what kind of view I had at this period of things in general, and the queer changes that all objects underwent to my perception, as they passed in whole or in part across my angle of disturbance. The thing which now annoyed me most—perhaps because more serious symptoms had abated—was the fact that the ground I walked on was always seen in the vicious angle; so that, when walking on a paved footpath, I could not walk confidently and comfortably. On the grass I could not detect the doubling, and on the earthy road it did not much signify; but on foot pavements the lines between the flags were all double lines, arranged thus , a yard apart at the left hand, and near together, but never touching, at the right. I may mention here, what might have been mentioned before, that all along, the images received by either eye, dissimilar as at times they were, appeared to be quite correct when viewed singly; the only difference was, that the image of a landscape, or a street seen in perspective, when seen with the left eye alone, had its horizon line at an enormous elevation above its proper place, that elevation

decreasing, of course, as the angle of disturbance grew less.

August saw me at Dudley, in the midst of the iron country, where I remained for a fortnight. My host had a large manufacture in active operation, and he took me to see his forges and puddling furnaces, and their ponderous produce. Whether it was that the carbon in the atmosphere strengthened my nerves, I cannot say, but at Dudley the angle of double vision grew rapidly less, and before a week had elapsed the doubling had ceased as a general thing, recurring only at intervals. The giddiness, however, and the frontal uneasiness, remained, and any attempt to read for more than twenty to thirty minutes at a time, or to write for the same space of time, was sure to bring on a feeling of bewilderment, under which I was compelled to desist. Further, although the double vision was gone, I could at any moment bring it back again. All I had to do was to throw my head back, and in that position to look at any object lying on the ground; at the same time a nervous feeling, common enough in such cases, but not easily accounted for, set me trying this experiment fifty times a day.

I could not consider myself cured so long as this capacity remained. I knew that by putting it in exercise I was most likely doing the very thing to ensure its continuance, and yet I could not refrain for any length of time from so doing. Fortunately for me, an interesting excursion was planned at this time, in which I was to join, and the preparations for which put my ailments for a time out of my thoughts. It came off in the pleasantest manner, and when it was over I had the satisfaction of discovering that I no longer possessed the undesirable faculty of recalling the incubus which had tormented me so long. Still, the disorder had not finally disappeared, but would return at times, as if under provocation. Thus, if I went suddenly into the sunshine from a shaded room, I would see double for an instant; and the same thing would occur on entering the house from the sunshine without. Also, any sudden shock to the nerves of sound would produce the same effect, as I proved by experiencing it after the discharge of some small cannons fired one evening close to our house, on the celebration of a wedding.

Towards the end of August I proceeded to Matlock, to try the efficiency of the hydropathic treatment in recruiting my general health, which had long been at fault. I felt that the establishment of average good health was necessary, if I would escape the return of my visual plagues; and I hoped to effect this by a few weeks' use of the baths. I shall not here recount the various moist ceremonies to which I was subjected. Enough to say, that in less than a week from beginning the baths, I had lost every remnant of my disorder, and had gradually "waked up," as it were, out of a sort of half dreamy condition—had recovered my old self, and lost all apprehension of the return of my visual plagues.

ODD MOMENTS.

"TAKE care of the pence, and the pounds will take care of themselves," is an oft quoted and generally received maxim. There is a story told of one who called on a merchant for a donation to a charitable object. He found the rich man in the act of rebuking a clerk for some trifling waste in the office. On receiving a handsome gift, he expressed agreeable surprise, saying frankly that he expected to fare ill, from what he heard on entering the office. "So far the reverse," was the

reply. "If I did not look after the pence I would have no pounds to give away for good objects."

Now, what is true of the oft despised pence, is true in a no lesser degree of those equally disregarded fractions of time, known as "Odd Moments." And yet these are the gold dust of life, the sands of which mountains are formed. As pence swell into pounds, so moments expand into hours, hours into days, weeks, months, years, until time for us exists no longer.

While studying the biographies of great men, it is truly surprising to find what they accomplished merely by making good use of the odds and ends of time—the sand-grains which appear of such small account to those who lack the energy and perseverance necessary to achieve greatness. Smiles, in his useful work styled "Self-help," tells us that Elihu Burritt, disclaiming all pretensions to anything like genius, attributed his first success in self-improvement to his not wasting "odd moments." While toiling at the blacksmith's forge, he mastered no fewer than eighteen ancient and modern languages, together with twenty-two European dialects. Dr. Mason Good translated Lucretius while going his rounds amongst his London patients. Dr. Darwin composed the chief portion of his works while similarly employed in the country. Dr. Burney attained a knowledge of French and Italian as he rode on horseback between the houses of his musical pupils. Henry Kirke White instructed himself in Greek in the course of his walks to and from a lawyer's office. Hall wrote his "Contemplations" as he travelled on circuit. Daguesseau, one of the greatest chancellors France ever possessed, wrote a large-sized and able volume in the intervals of waiting for dinner. And Madame de Genlis informs us she composed many of her books while waiting for the coming of the princess whom she taught.

Lockhart, in his "Life of Sir Walter Scott," speaking of his wonderful achievements in the way of literature, remarks, "Those who observed him most constantly, were never able to understand how he contrived to keep himself so thoroughly up with the stream of contemporary literature of almost all sorts, French and German as well as English. That a rapid glance might tell him more than another man could gather by a week's poring may easily be imagined; but the grand secret was the habitual practice of his own grand maxim, *never to be doing nothing!* Every moment was turned to account, and thus he had leisure for everything."

This turning to account every odd moment was a marked feature in the character of the late Dr. Abercrombie, whose works on the Intellectual and on the Moral Powers made him celebrated as a philosopher as well as a physician. In his daily rounds, or in driving to consultations at a distance, his pencil and note-book were in constant use, and many of his writings were thus composed while travelling in his carriage.

An Italian author expressed in his motto that "time was his estate;" an estate, indeed, which will produce nothing without cultivation, but which will always abundantly repay the labours of industry.

But while dwelling thus on the value of moments in respect to things of Time, let us not forget their more vital importance in respect to those of Eternity. *Tempus fugit*—time flies—we say, almost with levity. How few of us attach anything like a proper degree of solemnity befitting these words! Yet how awful their import, for "time, like life, can never be recalled." Let us remember this solemn truth, and so improve the fleeting moments as they pass over our heads, that we may not have wherewith to reproach ourselves when the shadows fall of that night wherein no man can work.

Varieties.

ROGATION WEEK.—Rogation week, previous to the Reformation, was called the Gang Week, and Rogation Days the Gang Days—from the Saxon *gangan*, to go. These days are the three days before Ascension Day, and were so termed because they were fast days, when God was besought (*rogare*) to bless the fruits of the ground, and avert his wrath from the nation. A homily was provided for each of these Gang Days; and a fourth for the day on which the parish boundaries were perambulated, which was sometimes done on Ascension Day; and it was the duty of the parish priest to see that those of his flock who had been at variance were reconciled, and made to walk together in the processions in Gang Week. "Holy" George Herbert says of his country parson: "Particularly he loves procession, and maintains it because there are contained therein four manifest advantages. First, a blessing of God for the fruits of the field; secondly, justice in the preservation of bounds; thirdly, charity in loving, walking, and neighbourly accompanying one another, with reconciling of differences at that time, if there be any; fourthly, mercy in relieving the poor, by a liberal distribution and largess, which, at that time, is, or ought to be used." In such processions Sir Thomas More joined; and Isaak Walton testifies to the strong value attached to their observance by the "judicious" Richard Hooker. But the Puritans objected to these processions and perambulations; and one of them, in 1572, especially denounced "the Gang Week" among "Popish Abuses." And so it came about that the Gang Week got a bad name, and that its observances have only come down to us in the form of "beating the bounds," and in the names of sundry "Gospel Trees" and "Gospel Oaks," under which the portion of Scripture was read on the Gang Days. Brand, indeed, found a custom existing in Hertfordshire, in 1787, when, on Old Michaelmas Day, which they called "the Ganging Day," a young man was chased by his companions across country, through brake and through briar; and, as they went, they bumped every person they met, whether male or female; and each publican contributed to the sport a gallon of ale and a plum cake, which, by rule, were consumed out of doors; and "the revellers generally spent the best part of the night in the fields." This Ganging Day was a septennial custom, and we need not be surprised at reading that respectable people took no part in it. A modest field-flower here asserts its claim not to be forgotten in connection with this subject. It is the milk-wort, with which the grass is tufted in May, and whose clusters of bloom range through all the shades of lilac and purple. It was called the Gang flower, because it bloomed in the Gang Week. It was also called the Cross flower, because the Feast of the Invention (or finding) of the Cross was held on May 3rd, when it was in blossom; and it was, moreover, known as the Rogation flower, and also as the Procession flower, because, as Gerarde said, "the maidens who walk in procession in Rogation Week do use it in their garlands." They wove its little tufted clumps into wreaths and nosegays, and with them they also decked their windows and street-doors in Gang Week; and, with their garlands, the young men and maidens walked out into the country, as we are told, "in goodlie companies," praising God for all his works, singing sweet psalms, and saying, "The earth, O God, is full of thy riches, and all thy works praise thee.—*Cuthbert Bede*."

[For reference to the Rogation Homily of the Bishop of Vienne-on-the-Rhone, under fear of earthquakes, in the fourth century, see article on the "Volcanoes of Auvergne," "Leisure Hour," September, 1867.]

A RESULT OF COMMERCIAL DEPRESSION.—The financial collapse of 1866 is having deeper effects than has been imagined. A striking fact in connexion with her Majesty's Customs clearly proves how great the devastation has been among private individuals in consequence of that panic. In the Inland Revenue Department at Somerset House, as the public are aware, is kept a register of all those persons paying duty on carriages and horses, and at this office notice has been received, since the 31st of December last, that 1,600 private persons intend to discontinue keeping their carriages, and claim, therefore, to be exempt from duty in the financial year 1868-9. This will cause a noticeable deduction in the balance which the Chancellor of the Exchequer will next have to exhibit. The loss to the revenue by these withdrawals will not be less than £10,000 per annum.—*Globe*.

"BEHOLD IN THESE WHAT LEISURE HOURS DEMAND,—AMUSEMENT AND TRUE KNOWLEDGE HAND IN HAND."—Cowper.

A PERPLEXING LETTER.

THE MORTONS OF MORTON HALL.

CHAPTER XXXV.—MR. SHARPE AND MARY TALBOT HAVE A DISCUSSION, WHICH TERMINATES UNSATISFACTORILY TO BOTH.

ONLY a week had passed since the arrival of the long-expected mail-packet from America, and Mary had eagerly looked for a letter from her brother. Within the brief period that had since elapsed, she had heard of that brother's loss; had believed herself left without a relative, alone in the world; and had found a relative whom she had believed to have been dead many years before she herself drew her first breath.

She recalled to mind the events that had occurred since her father's death. But little more than twelve months had passed since that first great sorrow of her young life. Since then, trouble, care, and change, had followed in rapid succession. Her mother's death; the removal from the happy home of her infancy and girlhood; her temporary sojourn in the vicinity of the great metropolis, when the kindness of old Mrs. Margaret lightened her first induction into that weary struggle for mere existence, which is the lot of the poor and friendless in this world; the removal to St. David, and entrance upon new duties; the departure of her only brother, followed by a strange

depression of spirits that was incomprehensible to her, and seemed prophetic of evil; the gossip to which she had listened in Dame Hoolit's cottage, which had given birth to painful suspicions; the miserable days and weeks that had succeeded—all these, crowding, as it were, one upon another, passed before her mental vision, and, as her memory dwelt upon them, she felt as though she had during the past twelve months lived twice as long as she had lived during the twenty preceding years.

Her thoughts, when she was alone, constantly reverted to her brother; but with her sorrow at his loss there came even now a gleam of hope. She kept this to herself. She never mentioned it even to Miss Wardour, or to Mr. Aston. It was a secret treasure of thought, which had become as firmly fixed in her mind as had her former forebodings of evil. She knew not why, but she believed that her brother still lived. At first it had been a mere faint hope. She had thought, one evening that since her mother's brother, who had been reported as lost at sea, had returned in life and health, after many long years, it was possible that Henry might still be alive. Gradually the faint hope had grown stronger, until it had almost become belief. Still, as I have said, she kept it to herself, never even hinting at such a suspicion, lest a word of doubt from others might shatter the hope which was the greatest happiness of her existence.
